Highlights of GAO-16-527T, a testimony before Subcommittee on Airland, Committee on Armed Services, U.S. Senate

March 16, 2016

UNMANNED AERIAL SYSTEMS

Further Actions Needed to Fully Address Air Force and Army Pilot Workforce Challenges

Why GAO Did This Study

In recent years, the size, sophistication, and cost of the Department of Defense's (DOD) UAS portfolio has grown considerably, as has the demand for trained UAS pilots.

This testimony discusses, among other things, DOD's progress in (1) taking actions to strengthen the management of Air Force UAS pilots and (2) addressing challenges the Army faces to ensure that its UAS pilots complete their required training and receive high-quality training.

GAO's statement is based on information from its reports issued in April 2014 on the Air Force UAS pilots and May 2015 on Army and Air Force UAS pilot training. For those reports, GAO reviewed DOD guidance on training UAS pilots and other relevant documents, examined nongeneralizeable training records of Air Force UAS units, conducted nongeneralizeable focus groups with active duty UAS pilots who were selected to cover a range of ranks and other factors at 6 installations, and interviewed DOD and military services officials. GAO obtained updates from DOD and military services officials for this statement.

What GAO Recommends

In April 2014 and May 2015, GAO made ten recommendations to DOD to improve the Air Force's management of UAS pilots, address Army UAS pilot training challenges, and enhance DOD coordination of UAS pilot training. DOD initiated action on most of these recommendations.

View GAO-16-527T. For more information, contact Brenda S. Farrell at (202) 512-3604 or farrellb@gao.gov.

What GAO Found

In April 2014, GAO reported on several issues the Air Force faced in managing its UAS pilots, and while the Air Force has taken some actions since then, it has not fully implemented GAO's recommendations to strengthen its management.

- **Personnel Requirements**: GAO reported that the Air Force had not accurately identified the number of UAS pilots required to accomplish its mission nor had it established a minimum number of pilots needed. As of March 2016, the Air Force had not updated personnel requirements and until it does, the Air Force will not know if it is assuming unacceptable levels of risk to accomplishing the mission and ensuring pilot safety.
- **Recruiting and Retaining**: GAO reported that the Air Force had faced challenges recruiting UAS pilots and might also face retention challenges in the future. The Air Force has taken steps to recruit more UAS pilots and offers a monthly assignment incentive pay to help retain pilots, but issues related to recruiting UAS pilots may warrant the Air Force's attention.
- **Alternative Sources**: GAO reported that the Air Force had not evaluated the use of alternative personnel populations such as enlisted or civilian personnel to help it sustain required UAS pilot staffing levels. In 2015, the Air Force announced it would test using enlisted personnel but has not formally evaluated using DOD civilian personnel as UAS pilots and thus may lack information on potential options for meeting personnel requirements.
- **Training**: GAO reported that the Air Force had faced challenges training its UAS pilots due to UAS pilot shortages, which impacted its ability to produce new pilots. Fully implementing GAO's recommendations pertaining to management of UAS pilots would better position the Air Force to address its training challenges.
- **Promotions**: GAO reported that the Air Force monitors the promotion rates of UAS pilots but had not analyzed factors that may relate to their low promotion rates. Until the Air Force does this analysis, it is unclear whether its actions to raise promotion rates are appropriate.

The Army has initiated steps to address challenges related to UAS pilots completing their required training and its use of less experienced instructors, which could affect training quality. In May 2015, GAO found that Army unit status reports did not require UAS pilot training information, and thus the Army did not know the extent pilots had been trained and were ready to deploy. GAO recommended that the Army require unit status reports to include UAS pilot readiness information. In March 2016, officials stated that the Army had taken steps to implement the recommendation, but its efforts are ongoing and thus it is too early to know their impact. Also, the Army had waived course prerequisites for about 40 percent of the UAS pilots attending a course to become instructor pilots from the beginning of fiscal year 2013 through February 2015. As a result, Army UAS pilots may not have been receiving the highest caliber of training to prepare them for UAS missions. GAO recommended in May 2015 that the Army mitigate risks posed by waiving prerequisites for less experienced UAS pilots, and in March 2016, Army officials stated that they have addressed the underlying causes that led it to waive the prerequisites, but they did not provide information for GAO to be able to determine whether they were continuing to waive these prerequisites.

United States Government Accountability Office

DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

Chairman Cotton, Ranking Member Manchin, and Members of the Subcommittee:

Thank you for the opportunity to be here today to discuss some of the unmanned aerial systems (UAS) pilot personnel challenges that the Department of Defense (DOD) faces. In recent years, the size, sophistication, and cost of DOD's UAS[1] portfolio has grown considerably, as has the demand for trained UAS pilots.[2] Each of the services flies various types of UAS. The Air Force flies the MQ-1 (Predator), the MQ-9 (Reaper), and the RQ-4 (Global Hawk) while the Army flies the RQ-7 (Shadow), the MQ-5 (Hunter) and the MQ-1C (Gray Eagle).

We found in our prior work that in recent years, the Air Force has not provided a sufficient number of UAS pilots to meet requirements due to several factors including most notably the increase in demand for intelligence, surveillance, and reconnaissance.[3] As a result, the UAS workload has been performed by fewer pilots working more hours to accomplish the Air Force mission. In additional in our prior work, we found that the Army has faced challenges ensuring that its pilots in UAS units that are not deployed conduct unit training to prepare them to perform their missions.[4] In April 2014 and May 2015, we reported on these other issues and made ten recommendations to DOD to improve the Air Force's management of UAS pilots, address Army UAS pilot training challenges, and enhance DOD coordination of UAS pilot training.[5]

I will focus my remarks today on DOD's progress in (1) taking actions to strengthen the management of Air Force UAS pilots, (2) addressing challenges the Army faces to ensure that its UAS pilots complete their

[1]DOD defines an unmanned aerial system (UAS) as a system whose components include the necessary equipment, networks, and personnel to control an unmanned aircraft—that is, an aircraft that does not carry a human operator and is capable of flight under remote control or autonomous programming.

3 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

required training and receive high-quality training, and (3) coordinating the training of UAS pilots within DOD.

My testimony is primarily based on reports we issued on UAS personnel issues in May 2015 and April 2014.[6] For those reports, we reviewed service guidance on training UAS pilots and other relevant documents, examined nongeneralizeable training records of Air Force UAS units, conducted nongeneralizeable focus groups at 6 installations with active duty UAS pilots from a range of ranks, and interviewed DOD and military services officials. We also followed up with OSD, Air Force and Army officials to determine what actions they had taken in response to the recommendations we have made. All work on which this testimony is based was performed in accordance with generally accepted government auditing standards. Those standards require that we plan and perform the audit to obtain sufficient, appropriate evidence to provide a reasonable basis for our findings and conclusions based on our audit objectives. We believe that the evidence obtained provides a reasonable basis for our findings and conclusions based on our audit objectives.

Air Force Has Made Efforts to Manage UAS Pilots But Further Actions are Needed

The Air Force has made efforts to manage its UAS pilots but has not fully addressed issues related to: identifying personnel requirements, recruiting and retention difficulties, the potential use of DOD civilians as pilots, pilots completing their required training, moving pilots through the training pipeline, and analyzing pilot promotion rates.

Air Force Has Not Accurately Identified the Number of UAS Pilots Required to Accomplish Its Mission

We found in April 2014 that the Air Force had not accurately identified optimum personnel requirements, or the crew ratio, for the number of UAS pilots it requires. As a result, Air Force UAS units may be operating at personnel levels that are too low, which may diminish the combat capability and flight safety of these units. The Air Force conducted a study in 2008 to determine the appropriate crew ratio for MQ-1 Predator squadrons but did not account for all of the flying and administrative tasks required of those squadrons due to the study's reporting timeframes. Based on the study, the Air Force concluded that the crew ratio for MQ-1

[6]GAO-15-461 and GAO-14-316.

4 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

Predator squadrons should be 10:1, which calls for 10 UAS pilots to support one near-continuous 24-hour flight presence of an Air Force UAS over a particular geographic location. Headquarters Air Force officials stated that, because of the omitted tasks, the study's recommended 10:1 crew ratio probably did not provide enough pilots to perform the work in an MQ-1 squadron. In addition, some UAS unit commanders and UAS pilots in some of the 10 focus groups we conducted at three Air Force bases said that the 10:1 crew ratio was too low.[7] High-performing organizations use complete and current data to inform their strategic human capital planning and remain open to reevaluating workforce planning efforts. Consequently, we recommended that the Air Force update crew ratios for UAS units to help ensure that the Air Force establishes a more-accurate understanding of the required number of UAS pilots in its units, and the Air Force concurred with our recommendation.

The Air Force has taken some actions in response to our recommendation, but Air Force officials told us that as of March 2016, the Air Force has not updated its UAS unit crew ratio. In our May 2015 report, we found that the Air Force had a three-phase personnel requirements study underway that was designed to update the UAS unit crew ratio. Air Force officials stated that the preliminary results of the study pointed to updating the UAS unit crew ratio and increasing the required number of pilots in UAS units. In May 2015, the officials also stated that they expected to update the UAS unit crew ratio later in 2015 but has not yet done so. Without an updated crew ratio, the Air Force lacks information needed to accurately identify the number of Air Force UAS pilots it requires and may need additional pilots.

As we also found in April 2014, Air Force documentation showed that crew ratios in UAS units had not met the 10:1 crew ratio identified in the 2008 study and instead fluctuated between 7:1 and 8.5:1, indicating that between 7 and fewer than 9 UAS pilots were used to sustain 24 hours of Predator operations rather than the 10 pilots recommended by the study. We found that the Air Force operated at these levels in order to provide a

[7]We conducted 10 focus group meetings with active-duty RPA pilots during site visits to Beale, Cannon, and Creech Air Force Bases. We decided to visit these three bases because more RPA pilots are stationed at these bases than other Air Force bases. We use the term "some," as in "pilots in some focus groups," to report topics that were discussed by UAS pilots in two to four of our focus groups.

5 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

higher number of CAPs to meet the requests made by combatant commanders. An Air Force instruction states that a crew ratio establishes the number of personnel required to support a unit mission and that if a ratio is too low, combat capability is diminished and flight safety suffers.[8] We recommended at that time that the Air Force establish a minimum crew ratio in Air Force policy below which UAS units cannot operate without unacceptable levels of risk to mission accomplishment and safety. The Air Force concurred with our recommendation and in comments on our report the Air Force stated that it anticipated that it would implement our recommendation by February 2015.

We reported in May 2015 that the three-phase personnel requirements study would also address the recommendation to establish a minimum crew ratio, but according to Air Force officials that study has not been finalized. In February 2016, the Air Force Deputy Chief of Staff of Operations directed that the Air Force use the 10:1 crew ratio as the minimum. However Air Force officials stated that due to personnel shortages, that ratio has not been enforced. As of February 2016, UAS units had been operating at a 9.4:1 crew ratio, meaning that between 9 and 10 UAS pilots were used to sustain 24 hours of Predator operations rather than the 10 pilots recommended by the study. Without a minimum crew ratio established in Air Force policy, the Air Force lacks information needed to determine when UAS units are operating at crew ratio levels that expose the Air Force to unacceptable levels of risk to accomplishing its mission and ensuring safety. In addition, UAS pilots may continue to experience a high pace of operations that limits their time for training and impacts their quality of life.

[8]Air Force Instruction 65-503, *Authorized Aircrew Composition-Active Forces*, table A36-1 (Feb. 1, 2012).

6 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

The Air Force Has Taken Steps to Recruit More UAS Pilots, but May Face Retention Challenges and Continues to Rely on Pilots Trained on Manned Aircraft to Meet Requirements

We found in April 2014 that the Air Force faced challenges recruiting UAS pilots and had not achieved its recruiting goals for UAS pilots in fiscal years 2012 and 2013. Air Force officials cited a number of reasons for missing the targets, including that potential UAS pilot recruits had a limited understanding of the UAS mission because the Air Force lacked recruiting officials with UAS experience. High-performing organizations tailor their strategies to the specific needs and challenges of the workforce to recruit high-quality personnel with critical skills, but the Air Force had not developed a strategy to address recruiting and retention of UAS pilots, including increasing the appeal of the UAS pilot career to potential recruits. As a result, the Air Force risked personnel shortages and continued reliance on manned-aircraft pilots to fill its personnel requirements. We recommended that the Air Force develop such a tailored strategy to recruiting and retaining UAS pilots to help ensure that the Air Force can meet and retain required staffing levels, and the Air Force concurred.

In 2015, Air Force senior leadership and headquarters officials stated that the Air Force was in the process of developing strategies to recruit UAS pilots. The Air Force has taken a number of actions that officials say have helped improve UAS pilot recruiting. For example, Air Force officials stated that Headquarters Air Force has efforts underway to educate potential recruits at the commissioning sources such as the Air Force Academy on the UAS mission. Officials told us that the Air Force is providing cadets information on the UAS pilot career and it is assigning UAS pilots to the Academy so that they can share their on-the-job experiences with cadets who may be interested in becoming a UAS pilot In addition, the Air Force began requiring cadets to volunteer to serve in any of the four aviation-related careers rather than applying for one specific career. This process allows the Air Force to assign cadets to any of the four careers based on Air Force needs, among other factors. Air Force officials stated that the Air Force has also opened up eligibility for becoming a UAS pilot by removing age requirements and granting waivers for certain medical requirements.

In April 2014 we also found that the Air Force may face challenges retaining UAS pilots. Pilots in 7 of the 10 focus groups we conducted at three Air Force bases indicated that retention of UAS pilots is or will be a challenge and UAS unit commanders in one location we visited and other Air Force officials stated that they were concerned with future retention rates of UAS pilots. As mentioned above, we recommended that the Air Force develop a tailored strategy that addresses both recruiting and retention of UAS pilots and the Air Force concurred.

7 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

To retain pilots, officials stated that the Air Force pays UAS pilots a monthly assignment incentive pay which is equivalent to the amount that manned pilots receive in aviation pay. Also, the National Defense Authorization Act for Fiscal Year 2016 granted the Air Force the authority to increase the annual amount that it pays UAS pilots in a retention bonus from $25,000 to $35,000. A Headquarters Air Force official told us in January 2016 that the Air Force has not used this authority to pay UAS pilots the increased amount of this retention bonus for two reasons. First, OSD has not yet issued related policy that the act required be issued before the Air Force could begin paying this increased amount. Second, the Air Force does not have enough data to determine what the retention patterns of this population will be because most of the pilots who specialize in flying UAS have not reached the end of their six-year service commitment. The official stated that the Air Force would like to determine if retention of this population is a concern before exercising the authority to offer these pilots the increased retention bonus amount.

Further, the Chief of Staff of the Air Force testified that the Air Force was not using the increased amount of the retention bonus. Specifically, he stated that the Air Force did not use that increased bonus for UAS pilots because the current amount was commensurate with that of other critically manned pilot categories. He further stated that the Air Force has other pilot categories that are even in more crisis than UAS at this point in time. We will be exploring further with the Air Force their plan to use this bonus and UAS pilot retention rates. The Air Force is pursuing initiatives to address shortages in the MQ-1 and MQ-9 pilot community that Air Force officials say will have a positive impact on retention. For example, the Air Force is supplementing its UAS pilot population with the Air Force Reserve and contractor support.

The Air Force has taken positive steps toward improving recruiting and, according to Air Force officials, has met or nearly met its UAS pilot recruiting goals for fiscal years 2014 and 2015, which shows progress toward resolving the recruiting challenges we found in 2014. At the same time, issues related to recruiting UAS pilots may warrant the Air Force's attention. In particular, the recruiting goals themselves may not be appropriate because, as previously discussed, the crew ratio has not yet been updated and the crew ratio is used to determine the total number of UAS pilots the Air Force requires. In addition, in April 2014, we also found that 42 percent of Air Force pilots flying UAS were manned-aircraft pilots and manned-aircraft pilot training graduates. Both of those groups are temporary UAS pilots who serve only one assignment in a UAS squadron. Air Force officials stated that as of March 2016, those groups represented

8 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

around one-third of Air Force UAS pilots. They also stated they anticipate they will not need to use any manned-aircraft pilot training graduates in fiscal year 2016 based on the number new UAS pilots that the Air Force anticipates will join the Air Force in fiscal year 2016. However, if the Air Force updates the crew ratio and finds it needs to increase the number of UAS pilots it requires, the Air Force may need to continue relying on manned aircraft pilots, indicating the continued importance of a strategic approach to recruiting and retention that is tailored to the needs of the UAS pilot workforce.

The Air Force Is Planning to Use Enlisted Personnel to Operate the Global Hawk but has not Evaluated the Possible Use of DOD Civilians

In April 2014, we found that the Air Force had not evaluated whether using alternative personnel populations such as enlisted or civilian personnel as UAS pilots is a viable option to help it meet and sustain required UAS pilot staffing levels. Headquarters Air Force officials had stated that they had, at times, considered the use of enlisted or civilian personnel but had not initiated formal efforts to evaluate the potential use of alternative personnel populations as UAS pilots. We recommended that the Air Force conduct such an evaluation to identify whether such alternative populations could help the Air Force meet and sustain required UAS pilots staffing levels. The Air Force partially concurred with our recommendation, stating that the Air Force had considered assigning enlisted personnel as UAS pilots but had decided that the responsibilities of piloting a UAS were commensurate with the rank of officers.

Subsequently, the Air Force has made progress toward implementing our recommendation. Even though the Air Force commented on our recommendation that the responsibilities of piloting a UAS were commensurate with the rank of officers, the Chief of Staff of the Air Force directed Headquarters Air Force staff to evaluate the potential of using enlisted personnel as UAS pilots in fall 2014. Further, the Air Force announced in December 2015 that it would integrate enlisted personnel into flying operations for the RQ-4 Global Hawk UAS. In December 2015, the Secretary of the Air Force and Chief of Staff of the Air Force stated that the goal of the initiative is to provide an additional avenue for capability growth and directed development of an implementation plan to use enlisted personnel to operate the Global Hawk by May of 2016. However, as of March 2016, Air Force officials stated that the Air Force has not formally evaluated using DOD civilian personnel as UAS pilots, as we recommended. Without also evaluating DOD civilian personnel, the Air Force may lack valuable information on whether additional options exist for meeting personnel requirements.

9 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

Air Force UAS Pilots Do Not Complete the Majority of Their Continuation Training

In April 2014, we found that the high pace of operations limited the time the UAS pilot workforce could put toward training and development. In addition, in May 2015, we found that Air Force UAS pilots do not complete the majority of their continuation training because they spend most of their time conducting operational missions due to shortages of UAS pilots and high workloads. Continuation training includes all training that takes place once a servicemember reaches their operational unit and finishes the training required to be considered qualified to perform the unit's mission. A core characteristic of a strategic training framework is that agency leaders and managers consistently demonstrate that they support and value continuous learning. We found that a nongeneralizable sample of training records for seven Air Force UAS units showed that, on average, 35 percent of the pilots in these units completed the continuation training for all of their seven required missions in fiscal year 2014. In March 2016, Air Force officials stated that UAS units make efforts to dedicate time to continuation training but the majority of their time is still devoted to combat missions based on personnel shortages and high demand. However, as we noted in May 2015, fully implementing all four recommendations we made in our April 2014 report pertaining to management of Air Force UAS pilots should better position the Air Force to address the UAS pilot shortages that contribute to training challenges.

The Air Force Faces Challenges Moving UAS Pilots Through the Training Pipeline

In April 2014 we found that the Air Force had reduced the capacity of its training units by moving instructor pilots to operational units to react to increasing demand for UAS capabilities. A core characteristic of a strategic training framework is that agencies should provide appropriate resources for its training programs. However, In May 2015, we found that the Air Force had staffed its UAS training squadrons at Holloman Air Force Base at 63 percent of their planned staffing levels due to shortages of UAS pilots across the Air Force, which Air Force officials stated in turn impacted the Air Force's ability to produce new pilots. We also reported actions the Air Force was taking to increase the number of instructor pilots, including studying the personnel requirements for the formal training unit. Air Force officials stated that as of February 2016, the Air Force had filled 84 percent of its instructor pilot positions at Holloman. These officials said that there is still a need to increase the number of instructor pilots, and the Air Force goal is to fill 100 percent of the instructor pilot slots by fiscal year 2017. Fully implementing our recommendations pertaining to management of UAS pilots should better position the Air Force to address the need to increase the number of instructor pilots.

10 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

The Air Force Monitors UAS Pilot Promotion Rates but Has Not Analyzed Factors Related to Those Rates

In April 2014, we found that the Air Force monitors the promotion rates of UAS pilots but had not analyzed factors that may relate to their low promotions rates. The Air Force had found that UAS pilots were promoted below the average rate for active-duty line officers on 20 of 24 officer promotion boards between 2006 and 2012 and 2013, depending on rank. We also found that UAS pilots were promoted at the lowest rate of any career field on 9 of the 24 boards. Statistical principles call for researchers to account for potential key factors in analysis because when they omit key factors, the relationships between other factors may not be accurately estimated. The Air Force analyzed promotions across a group of officers –or the Line of the Air Force—including UAS pilots, and found factors that related to promotions in general. However, the Air Force had not analyzed the factors related to UAS pilots' promotions specifically and, as a result, it did not have the information to determine what factors may affect their promotions. We recommended that the Air Force include the career field effect of being a UAS pilot into its analysis to determine whether and how being a UAS pilot is related to promotions and determine whether the factors identified in the analysis of Line of the Air Force officers are also related to UAS pilot promotions.

The Air Force partially concurred with our recommendation, stating that because the UAS career field is a subsection of the Line of the Air Force, the factors identified in analysis of the Line of the Air Force are directly related to UAS pilot promotions, which we acknowledged in our report. As of January 2016, the Air Force had not taken any steps to implement our recommendation and when we sought additional information in March 2016, the Air Force did not respond in time for this statement. Without including the career field effect in its analysis, the Air Force may not be targeting actions it is taking to raise UAS pilots promotion rates at the appropriate factors, and information it has reported to Congress may not be accurate.

11 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

Army Has Not Fully Addressed Challenges Related to UAS Pilots Completing Required Training and the Use of Less Experienced Instructors

The Army has not fully addressed challenges related to UAS pilots completing their required training and its use of less experienced instructors, which could affect training quality.

Army UAS Pilots in Shadow Units that are Not Deployed Are Not Completing Continuation Training

In May 2015, we found that a 2015 Army review showed that pilots in most of the Army's Shadow units did not complete training in their units in fiscal year 2014.[9] We previously developed a set of core characteristics for assessing strategic training programs in the federal government.[10] One of these characteristics calls for agency leaders to demonstrate that they value continuous learning. [11] In January 2015, the Chief of Staff of the Army directed the Army Training and Doctrine Command to evaluate if unit training was a factor that caused UAS mishaps in combat. The Army reviewed this issue from January 2015 through March 2015 and found that UAS pilots in 61 of the 65 RQ-7B Shadow units that were not deployed in fiscal year 2014 had flown an annual unit average of 150 hours of training,[12] which is about 200 hours less than minimum amount of training flight hours that an Army unit is required to fly according to the review. In addition, the review included recommendations to increase emphasis on training in UAS units including that the Army should (1) issue guidance to unit commanders on UAS training; (2) ensure that UAS

[9]Army Shadow units operate the RQ-7 Shadow UAS.

[10]GAO, *A Guide for Assessing Strategic Training and Development Efforts in the Federal Government*, GAO-04-546G (Washington, D.C.: Mar. 2004). To develop these characteristics, we consulted government officials and experts in the private sector, academia, and nonprofit organizations; examined laws and regulations related to training and development in the federal government; and reviewed literature on training and development issues, including previous GAO products on a range of human capital topics.

[11]GAO-04-546G.

[12]This measure shows an average of the total amount of training time that all pilots in each unit flew in fiscal year 2014.

12 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

warrant officers are qualified on their UAS; (3) Increase the amount of home station training for UAS units; and (4) establish a system to report UAS training readiness on unit status reports.

We corroborated the Army's findings in focus groups discussions[13] with Army UAS pilots and in responses to a questionnaire that UAS unit commanders provided. Specifically, we found that pilots in all eight of the focus groups we conducted with Army UAS pilots stated that they cannot complete training in their units. For example, a pilot in one of 8 focus groups stated that during his 3 years as a UAS pilot, he had been regularly tasked to complete non-training-related activities, and as a result he completed a total of 36 training flight hours even though the requirement is that he should have completed 72 flight hours during those three years. Further, Army UAS pilots in each of the 8 focus groups we conducted stated that they had difficulty completing UAS pilot training in units because they spend a significant amount of time performing additional duties such as lawn care, janitorial services, and guard duty. Additionally, five of the six Army UAS units that responded to a questionnaire we administered indicated that their units faced challenges completing training in their units.

At the time, we did not make any recommendations on this issue. We noted that while the Army review and our analysis showed that most Army UAS pilots were not completing training in their units, the Army's training shortfalls might be addressed by the high-level interest expressed by the Chief of Staff of the Army and the recommendations in the Training and Doctrine Command review, if implemented. We asked the Army to provide information to update our May 2015 report to show (1) the amount of unit training that UAS pilots completed in fiscal year 2015, and (2) actions the Army had taken in response to its internal recommendations to increase emphasis on unit training. Finally, the Army

[13]We conducted 8 focus groups with Army UAS pilots at Ft. Huachuca, AZ and Ft. Hood, TX. We selected these locations on the basis of several factors including the type and size of UAS flown in the unit; missions of the unit; whether or not the unit is deployed (we did not meet with units who were deployed); number of UAS pilots in the unit; the major command of the unit; and location of the unit. We conducted focus groups with active-duty UAS pilots at these locations to gain their perspectives on the Army's UAS training efforts. To select specific UAS pilots to participate in our focus groups, we worked with officials at each of the instillations to develop a diverse group of active-duty UAS pilots. To obtain a variety of perspectives, we selected UAS pilots with varying amounts of experience flying UASs and additional duties in their units. The opinions of UAS pilots we obtained during our focus groups are not generalizable to the populations of all UAS pilots in the Army.

13 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

did not respond to our request to provide updated information on these topics for this statement.

Army Does Not Have Visibility over the Amount of Training that Pilots in Some UAS Units Have Completed

In May 2015, we also found that the Army does not have visibility over the amount of training that pilots in some Army UAS units have completed. Another core characteristic of a strategic training framework highlights the importance of quality data regarding training.[14] However, we found that Army does not have access to data that would allow it to measure the amount of training that UAS pilots have completed in Army UAS units. Army Forces Command officials stated that they need information about the readiness level of pilots in UAS units to determine if a unit is ready to deploy and perform its mission. These officials stated that they review Army unit status reports to determine if a unit is prepared to deploy. However, officials from Army Headquarters, Army Forces Command and the Army Aviation Center of Excellence both stated that these reports do not provide any information on the readiness levels of the UAS pilots in UAS units because the reports are not required to include this information. Officials at Forces Command stated that, using these reports, they have designated units as available for deployment and later learned that a significant portion of the pilots in those units had not completed their readiness level training. Without requiring information on the readiness level of pilots in UAS units as part of unit status reports, Army Forces Command will continue to lack visibility over the amount of training that UAS pilots have completed in units. To provide greater visibility over the extent to which Army UAS units have completed required training to leaders responsible for deployment decisions, we recommended that the Army require unit status reports to include information on the readiness levels of UAS pilots in UAS units and the Army concurred.

Since we issued our report in May 2015, Army Headquarters officials stated that the Army had drafted an update to Department of the Army Pamphlet 220-1 that would require UAS units to report the readiness levels of the UAS pilots in UAS units.[15] In addition, these officials stated that the Army was working on updating the unit status reporting software

[14] GAO-04-546G.

[15] Army Pamphlet 220-1, *Defense Readiness Reporting System-Army Procedures*, (November 16, 2011).

14 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

to enable units to comply with the planned update to the Army pamphlet. While the steps that Army has taken to date should address our recommendation, its efforts are ongoing and thus it is too early to know their impact.

The Army Has Taken Action to Increase the Number of Instructors, but Its Use of Less Experienced Instructors Could Affect the Quality of UAS Pilot Training

In May 2015, we found that the Army had taken actions to increase the number of UAS instructors, but it had not fully addressed the risks associated with using less experienced instructors. In order to increase the number of its instructors in response to an increase in the number of UAS units, the Army waived course prerequisites for about 40 percent of the UAS pilots attending the course to become instructor pilots from the beginning of fiscal year 2013 through February 2015.These prerequisites—such as a minimum number of flight hours— are important because they help ensure that UAS pilots volunteering to become instructors to help ensure that instructors are fully trained and ready to instruct UAS pilots.

In May 2015, we found that the Army had taken steps to mitigate the risks of using less proficient UAS instructors. For example, in fiscal year 2015, the Army stopped waiving course prerequisites related to proficiency, according to Army Aviation Center of Excellence officials. However, the Army could continue to waive prerequisites related to experience. As a result, we found that Army UAS pilots may not have been receiving the highest caliber of training needed to prepare them to successfully perform UAS missions. To help ensure that Army UAS pilots receive the highest caliber of training, we recommended, in May 2015, that the Army take additional steps to mitigate potential risks posed by waiving course prerequisites for less experienced UAS pilots attending the course to become instructors and the Army concurred.

In February 2016, Army Headquarters officials stated that the Army has taken additional steps to mitigate potential risks posed by waiving course prerequisites for less experienced UAS pilots attending the course to become instructors. However, the Army did not respond to requests we made in March 2016 for it to explain these additional steps; nor did the Army respond to requests we made for it to provide updated statistics to determine if the Army was continuing to waive these prerequisites. In addition, an Army official from Training and Doctrine Command stated that the Army had not provided additional training or preparation for instructors who previously received a waiver of one of the course prerequisites to attend the instructor course as we had recommended.

15 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

DOD is Coordinating on Some Aspects of UAS Pilot Training But Still Lacks a Department-Wide Strategy

Some coordination is occurring among the services with respect to UAS pilot training but DOD has not yet developed a department-wide UAS training strategy. In May 2015, we found that the actions that the services had taken were either partially consistent or inconsistent with the key practices to enhance and sustain agency coordination.[16] We previously reported that agencies face a range of barriers when they attempt to collaborate with other agencies. To help agencies overcome these barriers, we developed a set of key practices that can help enhance and sustain federal agency collaboration.[17] According to these key practices, federal agencies can enhance and sustain their coordination if they take a number of actions including the following.[18]

- Agencies should identify the human, information technology, physical, and financial resources needed to initiate or sustain their coordinated effort. In May 2015, we found that DOD actions were partially consistent with this principle. For instance, the Air Force and the Army provide resources to train all Marine Corps UAS pilots. However, as we found in May 2015, both the Army and the Air Force are working on addressing UAS personnel shortages and such shortages may negatively affect their ability to continue to train Marine Corps UAS pilots.
- Agencies should agree on their roles and responsibilities, including how the coordinated effort will be led. In May 2015, we found the Office of the Deputy Assistant Secretary of Defense (Readiness) and the services have not agreed on roles or responsibilities for any of the services for coordinating on UAS pilot training. The Office of the

[16]GAO-15-461

[17]We reported these key practices in *Results-Oriented Government: Practices That Can Help Enhance and Sustain Collaboration among Federal Agencies*, GAO-06-15 (Washington, D.C.: Oct. 21, 2005). For our 2005 report, we derived these practices by reviewing academic literature and prior GAO and Congressional Research Service reports; and interviewing experts in coordination, collaboration, partnerships, and networks from the National Academy of Public Administration, the IBM Center for The Business of Government, and the University of California, Berkeley.

[18]While these practices address interagency collaboration, we believe these practices apply to intra-agency coordination in DOD because multiple departments within DOD are responsible for UAS pilot training programs. Further, we reviewed these practices with officials from the Office of the Assistant Secretary of Defense for Readiness and these officials agreed that the practices applied in the context of our review. In addition, we confirmed these practices and reported on mechanisms for implementing collaborative efforts in Managing For Results: Key Considerations for Implementing Interagency Collaborative Mechanisms, GAO-12-1022 (Washington, D.C.: Sept. 27, 2012).

16 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

Under Secretary of Defense for Acquisitions, Technology, and Logistics established a UAS Task Force in 2007, and its charter states that its mission is to coordinate critical DOD UAS issues. However, a task force official stated that the task force does not play a role in coordinating UAS pilot training among the services.

- Agencies should define a clear and compelling rationale for coordination. In March 2010, we found that DOD had begun to address UAS training challenges, but had not developed a strategy to prioritize and synchronize these efforts. We recommended that DOD establish a DOD-wide UAS training strategy to resolve challenges that affect the ability of the Air Force and the Army to train personnel for UAS operations and DOD concurred with that recommendation.[19] The Office of the Deputy Assistant Secretary of Defense (Readiness) tasked the RAND Corporation to draft a DOD-wide UAS training strategy and provided RAND with guidelines about the content and purpose of the strategy. [20] However, these guidelines did not discuss if or how the services should coordinate on UAS pilot training. In September 2014, RAND provided a draft of a UAS training strategy to the Office of the Deputy Assistant Secretary of Defense (Readiness), but the draft did not define a rationale for the services to coordinate on training UAS pilots nor did it more generally discuss service coordination on training UAS pilots.

In our May 2015 report we noted that the Acting Deputy Assistant Secretary of Defense (Readiness) had stated, in January 2015, that the services should coordinate their efforts to train UAS pilots and that the services may have valuable training lessons to share with one another because the services fly similar UAS. He cited similarities between the Air Force's Predator and the Army's Gray Eagle and between the Air Force's Global Hawk and the Navy's Triton. He stated that if the services coordinated on training their UAS pilots the department as a whole may be able to train its UAS pilots more effectively and efficiently. However, as

[19]GAO, *Unmanned Aircraft Systems: Comprehensive Planning and a Results-Oriented Training Strategy Are Needed to Support Growing Inventories*, GAO-10-331 (Washington, D.C.: Mar. 26, 2010).

[20]In 2010, we found that DOD had commenced initiatives to address training challenges, but had not developed a results-oriented strategy to prioritize and synchronize these efforts. We recommended that DOD establish a UAS training strategy to comprehensively resolve challenges that affect the ability of the Air Force and the Army to train personnel for UAS operations and DOD concurred with our recommendation. See Unmanned Aircraft Systems: Comprehensive Planning and a Results-Oriented Training Strategy Are Needed to Support Growing Inventories, GAO-10-331 (Washington, D.C.: Mar. 26, 2010).

17 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

we found in May 2015, without a DOD-wide UAS training strategy that addresses if and how the services should coordinate with one another on training UAS pilots, the services may miss opportunities to improve the effectiveness and efficiency of this training and may waste scarce funds on training UAS pilots. We therefore recommended that the Office of the Under Secretary of Defense for Personnel and Readiness address how the services should coordinate with one another in the DOD-wide UAS training strategy the office was drafting at the time we issued our report, and DOD concurred with this recommendation.

In March 2016, the Director of Force Training in the Office of the Assistant Secretary of Defense (Readiness) stated that DOD had not yet published the DOD-wide UAS training strategy but the strategy was in the final drafting phase. He stated that his office held a summit in October 2015 with each of the services and during this summit representatives from each of the services discussed the draft strategy and how to incorporate our recommendation into the strategy. He stated that his office was collecting the services' comments on the draft strategy and would provide them to RAND and that RAND is currently revising the strategy. The Director stated that the current version of the strategy addresses our recommendation and provides detail on how the services could coordinate with one another during sustainment and mission readiness training. However, as of March 2016, the Office of the Assistant Secretary of Defense (Readiness) has not yet issued the DOD-wide UAS training strategy.

In summary, the Air Force and the Army have taken actions to implement the recommendations that we made to address some of the UAS workforce challenges we identified in 2014 and 2015. However, none of the recommendations that we have discussed today have been fully implemented. As you know, in June 2014 the Senate Armed Services Committee directed the Air Force to implement three of our recommendations—which address the UAS unit crew ratio, recruiting, and retention—that we discussed today. In addition, the Committee Chair and Ranking Member have urged the Secretary of Defense to focus senior leaders in the department on the UAS pilot training shortfalls in the Army and Air Force that we also discussed today. Fully implementing our recommendations would set the Air Force on a positive course toward helping ensure the high-demand UAS pilot workforce has sufficient numbers and is well trained. Similarly, as we recommended, greater visibility over the extent to which Army UAS units have completed required training and additional training for instructors who previously received a waiver of one of the course prerequisites would help ensure a

18 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

highly skilled future Army UAS workforce. However, without addressing if and how the services can enhance their coordination efforts on training UAS pilots in DOD's forthcoming training strategy, the services may not be able to achieve additional benefits to the efficiency and effectiveness of UAS pilot training across the department.

Chairman Cotton, Ranking Member Manchin, and Members of the Subcommittee, this concludes my prepared testimony. I look forward to answering any questions.

GAO Contact and Staff Acknowledgments

If you or your staff have any questions about this testimony, please contact Brenda S. Farrell, Director, Defense Capabilities and Management at (202) 512-3604 or FarrellB@gao.gov. Contact points for our Offices of Congressional Relations and Public Affairs may be found on the last page of this statement. GAO staff who made key contributions to this testimony are Lori Atkinson, (Assistant Director), James P. Klein, Kelly Liptan, Felicia Lopez, Mike Silver, and Erik Wilkins-McKee.

IIDA Paper P-5253

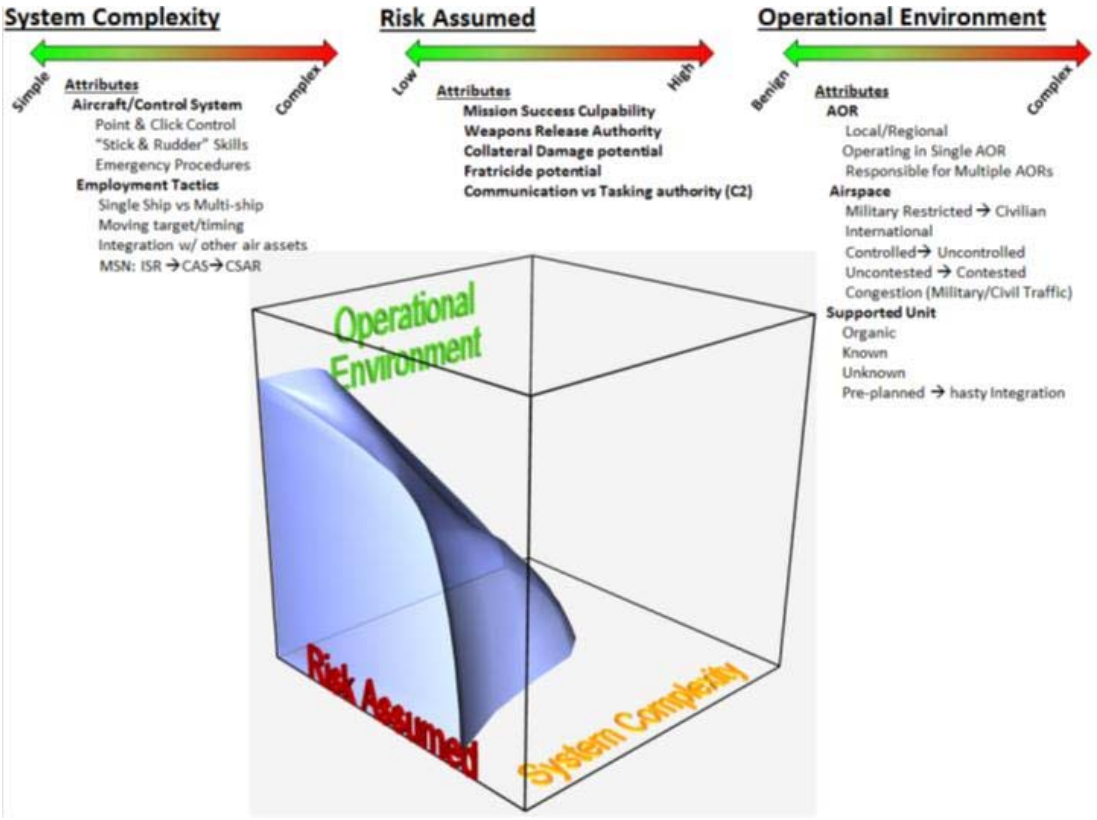
Staffing for Unmanned Aircraft Systems (UAS) Operations

Travis L. Norton, Lt. Col., USAF

 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

This page is intentionally blank.

Executive Summary



Within the last two decades, Unmanned Aircraft Systems (UAS) have undergone tremendous development and have become an integral part of joint military operations. Based on the unique capabilities and force multiplying effects of the UAS, each military Service has applied them across the spectrum of military operations. With the rapid development and adoption of this technology, a lack of an overall unifying effort to synchronize programs has led to several Service-unique staffing methodologies across the UAS enterprise. In turn, this has led to several manpower challenges across the Department of Defense's (DoD) UAS enterprise, which the department must address immediately if it is to preserve current UAS capability. While addressing these challenges the department must look to the future, as UAS will inevitably increase in both capability and number across the battlespace, a combination for which current staffing principles will prove unsupportable. This paper assesses the DoD's UAS operations to identify commonalities and differences while developing potential alternatives to standardize staffing methodologies where appropriate and maximizing manpower cost savings and mission effectiveness.

This paper analyzes each of the categories of performers available to DoD's UAS enterprise. These performers include not only uniformed military personnel and contractors, but also government service civilians, who are not currently used. Using existing statutory guidance, a framework for analysis is provided to distill mission requirements and identify who is authorized to conduct operations. In some cases, specifically with larger UAS (e.g., MQ-1, MQ-9, RQ/MQ-4), it was discovered that if mission elements are segregated (i.e., launch and recovery, transit, surveillance, weapons employment), opportunities to use a true workforce mix of individuals presents itself. When specifically looking at cost savings, the opportunity to use government service civilians to conduct appropriate mission elements is also available. This opportunity, in turn, decreases uniformed military personnel requirements and enables them to focus on combat-specific elements.

A common point raised when assessing differences between Service UAS programs was the role of enlisted members vs. officers. Regardless of how manpower costs are calculated, using an enlisted military member always costs less than using an officer. Similarly, when assessing the officer corps, warrant officers will always cost less than utilizing the "traditional" officers. Addressing concerns associated with this debate, this paper avoids a binary application for categories of performers (i.e., all pilots should be enlisted or officer). Rather, an illustrative model was designed to remove emotion and cultural bias from this discussion and enable an analysis of mission requirements based upon system complexity, risk assumed, and the operational environment (see illustrative

26 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

figure on following page). When looking at UAS operations in this way, it is apparent that while manpower efficiencies are available across each of the Service's programs, the individual Services do—and should—maintain some unique staffing methodologies based upon their specific mission requirements.

In assessing where associated manpower efficiencies are available, analysis identified several common "business rules" built upon common lessons learned and associated best practices. Where these business rules did not apply, this paper identifies several observations on the rationale applied to a Service's staffing determination. Using these business rules and observations enabled the follow-on assessment of individual UAS mission elements, thereby identifying potential staffing alternatives for cost analysis, which remained platform agnostic rather focusing on mission requirements.

In total, the greatest manpower cost savings were available through the use of government civilians to conduct non-kinetic UAS operations. Applying a mix of government civilians and uniformed military to the Air Force MQ-1/9 launch and recovery force saves approximately $25.65 million across the Future Years Defense Program (FYDP). If government civilians are integrated into Continental United States (CONUS)-based operations (e.g., to transit the UAS), the Air Force could save another $68.3 million across the FYDP. Although these savings are Air Force unique, they highlight potential savings opportunities within similar sister-Service operations. It is also acknowledged that these

27 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

savings are conservative in nature as this paper only analyzed annual savings versus the larger life-cycle costs associated with career development and retention initiatives. This paper suggests an alternative analysis by providing several related areas that are recommended for further research. These areas include additional manpower studies for maintenance and intelligence support personnel associated with UAS operations and the impact associated with the rapid maturation of technology on Service force presentation and staffing methodologies.

While this paper provides preliminary estimates of cost savings, the framework used identifies these potential savings not only in terms of cost, but also as providing an opportunity to decrease the overall requirement for uniformed military personnel. The rapid growth associated with DoD's UAS enterprise, coupled with the combatant commanders' insatiable demand for UAS capabilities, has led each Service to drive aggressively toward fielding these crucial platforms. As this paper shows, now is the time to reassess that growth across the entirety of DoD to capitalize on best practices, integrate efforts, and standardize staffing practices where appropriate. Not only will such efforts improve both current mission effectiveness and cost value of manpower, but they can also address the inevitable challenges faced with this rapidly expanding career field.

This page is intentionally blank.

1. Introduction

The purpose of this study is to identify alternative staffing strategies that would enable the Department of Defense's (DoD) to accomplish its Unmanned Aircraft System (UAS)-related missions in a more cost-effective way. This paper will analyze DoD's mission requirements against the individual Service's approach to UAS staffing and will identify common practices and differences. After gaining an understanding of the operational and cultural factors associated with UAS employment, several alternative staffing methodologies will be provided.

A. UAS Definitions

Joint Publication 1-02 lays the foundation by defining a UAS as "an aircraft or balloon that does not carry a human operator and is capable of flight under remote control or autonomous programming."[1] DoD defines a UAS as a "system whose components include the necessary equipment, network, and personnel to control an unmanned aircraft."[2] DoD categorizes UAS based upon weight, operating altitude, and airspeed, as depicted in Figure 1. The Air Force goes one step further and defines Groups 1 through 3 as small unmanned aircraft systems (SUAS) and Groups 4 and 5 as remotely piloted aircraft (RPA).[3] Although there is much debate across the community on the specific terminology, this paper will use the term UAS.[4]

2 Department of Defense, *Unmanned Systems Integrated Roadmap FY2013–203*8 (Washington, DC: Office of the Secretary of Defense, 2013), 4, http://www.defense.gov/pubs/DoD-USRM-2013.pdf.

3 United States Air Force, *RPA Vector: Vision and Enabling Concepts 2013–2038* (Washington, DC: Headquarters, United States Air Force, February 17, 2014), 13, http://www.defenseinnovationmarketplace.mil/resources/USAF-RPA_VectorVisionEnablingConcepts2013-2038_ForPublicRelease.pdf.

4 It is appropriate to note the Chairman of the Joint Chiefs of Staff's comment, "You will never hear me use the word 'drone,' and you will never hear me use the term 'unmanned aerial systems.' Because they are not. They are Remotely Piloted Aircraft" (see Kevin McCaney, "A Drone by Any Other Name Is … an RPA?," *Defense Systems*, May 23, 2014, http://defensesystems.com/articles/2014/05/23/dempsey-rpa-drones-uas.aspx). However, for consistency with the initial tasking of this paper and to stay in line with current documented government publications, this paper will use the term UAS, except when referring directly to the Air Force's aircraft.

34 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

Source: Department of Defense, Unmanned Systems Integrated Roadmap FY2013–2038 (Washington, DC: Office of the Secretary of Defense, 2013), 6, http://www.defense.gov/pubs/DoD-USRM-2013.pdf.

Note: Although this grouping is convenient for current missions, technology advances and the expanding growth of UAS employment will blur the lines between the UAS groups. The implications associated with this maturation of technology are not addressed in this paper; however, further research is recommended.

Figure 1. DoD UAS

To set a baseline, the basic components of UAS are as follows:[5]

- An unmanned aircraft (UA) that flies without a person on board. This definition includes fixed-wing, rotary wing, and lighter-than-air vehicles.
- A mechanism for launching and retrieving the UA.
- A ground control station (GCS) to provide the means for a pilot/operator to control the flight of the UA by transmitting signals to it and receiving position, condition, and other telemetry. A communications terminal to receive signals from the UA and relay these signals to the GCS and other selected users.

35 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

- A sensor suite installed on the UA to provide data and images to the GCS.
- For armed UA, missiles, bombs, or other munitions and weapons attached to the aircraft and used to strike targets.

B. UAS Missions

The inherent flexibility of aviation, combined with the technological advances in UAS, enable them to facilitate a myriad of military missions. Joint doctrine articulates six specific Joint functions as "related capabilities and activities grouped together to help JFCs [Joint Force Commanders] integrate, synchronize, and direct joint operations."[6] These functions are C2 [command and control], intelligence, fires, movement and maneuver, protection, and sustainment.[7] While traditionally viewed as an Intelligence, Surveillance, and Reconnaissance (ISR) asset, UAS are used by each of the Services across all six Joint functions with mission opportunities continuing to expand as UAS capacity/capability matures. Individual Services, however, label their missions in a manner consistent with their respective charters. Chapters 5 and 6 of this paper analyze these missions and the Services' UAS applications. Through this analysis, the importance behind mission task and level of warfare supported (e.g., tactical, strategic) becomes evident in the overall Services' approach to their staffing methodology.

C. Generic UAS Personnel Requirements

Although each Service has unique operational approaches to its respective UAS programs, generic roles and responsibilities are associated with all current systems. These generic roles and responsibilities are distilled into the following generic personnel requirements:

- **Pilot/operator.** Responsible for controlling the flight of a UAS to include, in the absence of automatic systems, taking off and landing.
- **Sensor operator.** Controls on-board sensors and receives data and images. For many smaller UAS, this role is combined with that of the pilot/operator.
- **Intelligence analyst.** Responsible for the exploitation of the data/signals that the UAS collects. This role also has multiple analyst subsets, including video imagery, all-source intelligence, signals intelligence, and so forth. For larger UAS (Group 4/5), these roles are typically performed by an element of the processing, exploitation, and dissemination (PED) intelligence community.

---

[6] Joint Chiefs of Staff, *Joint Operation*, Joint Publication 3-0 (Washington, DC: Department of Defense, 11 August 2011), III-1, http://www.dtic.mil/doctrine/new_pubs/jp3_0.pdf.

[7] Ibid.

36 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

- **Maintainer.** Responsible for repairing and servicing the UAS and associated equipment within the UAS. Several technicians are associated with this category, including aircraft, control station, payload, weapons, communication, data link, and so forth.

In scoping this study, analysis was not conducted on maintenance or intelligence professionals. Although crucial to the overall UAS operations, this requirement would have been beyond the scope of this study. This study also did not address manning requirements associated with support functions that are provided from either supported units and/or higher headquarters (acquisition, security, transportation, personnel services, and so forth). However, several observations from our analysis are included under recommended areas for further research.

D. Organization and Methodology

This paper has three main components, which cover existing practices and guidance, analysis, and supporting documentation. Chapters 2–4 will address the categories of performers within UAS operations, summarize applicable statutory guidance responsible for manpower decisions, and outline each of the Service's current staffing practices for its UAS program. The next three chapters will focus on the analysis of these data by first defining the baseline of apparent "business rules" used across the Services. Analysis then turns toward identifying the differences between Service staffing methodologies to provide context and to identify opportunities within the enterprise. After looking at current staffing strategies, the individual elements of a UAS mission are analyzed to identify additional opportunities. Finally, this information is combined to outline potential staffing alternatives and provide initial cost analysis to inform decision makers on the need for further research.[8]

While manpower costs associated with staffing methodologies provided the genesis for this paper and hold ever-increasing importance in this era of diminishing budgets, the analysis must acknowledge that this paper deals with a combat-related capability and that the risk to people and missions must be addressed. Analysis was driven by two guiding principles outlined in DoD manpower directives/instructions: "National military objectives shall be accomplished with a minimum of manpower that is organized and employed to provide maximum effectiveness and combat power,"[9] and "Risk mitigation shall take

---

[8] Appendices provide greater detail and supporting documentation, as required.

[9] Department of Defense, "Guidance for Manpower Management," DoDD 1100.4 (Washington, DC: USD(P&R), February 12, 2005), 2, http://www.dtic.mil/whs/directives/corres/pdf/110004p.pdf.

37 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

precedence over cost savings when necessary to maintain appropriate control of Government operations and missions … and to maintain core capabilities and readiness."[10]

During the research for this paper, a common point raised rested upon a rather binary decision concerning enlisted vs. officers. Regardless of how manpower costs are calculated, if an officer is replaced with an enlisted military member, the program instantly costs less. As Table 1 depicts, when comparing the delta between annual costs, even greater savings can be obtained when civilians are included. Because of this implicit relationship between rank and annual cost, analysis avoids the binary application for category of performers (i.e., all pilots should be enlisted or officer). Rather, work-force staffing methodologies are analyzed based upon a business case analysis that combines variables such as mission risk, authorities, and the determination of inherently governmental (IG) activities.

Table 1. Delta between Rank/Pay Grades Annual Total Cost

	O-4	O-3	W-3	W-2	E-7	E-5
O-3	34,202					
W-3	43,334	9,132				
W-2	60,108	25,906	16,774			
E-7	63,438	29,236	20,104	3,330		
E-5	91,081	56,879	47,747	30,973	27,643	
GS-12	96,049	61,847	52,715	35,941	32,611	4,968
GS-11	114,141	79,939	70,807	54,033	50,703	23,060
GS-7	143,688	109,485	100,354	83,580	80,249	52,607
GS-5	155,550	121,348	112,216	95,442	92,112	64,469

While some of the overall assumptions used—specifically, officer vs. enlisted—may be contentious among the Services, the methodology used in the analysis frames the issues in such a manner that if someone decides to adjust the assumption, the subsequent analysis and methodology remain the same. To provide a standard baseline for calculating costs across staffing methodologies, this analysis used DoD's Cost Assessment and Program Evaluation (CAPE) Full Cost of Manpower (FCoM) tool as directed by Department of Defense Instruction (DoDI) 7041.04.[11] FCoM provides annual costing data only and does

[10] Department of Defense, "Policy and Procedures for Determining Workforce Mix," DoDI 1100.22 (Washington, DC: USD(P&R), April 12, 2010), 15, http://www.dtic.mil/whs/directives/corres/pdf/110022p.pdf.

not include the full life-cycle costs associated with individual military occupational specialty/Air Force Specialty Code (MOS/AFSC) training and retention factors.

39 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

2. Categories of Performers

When analyzing staffing strategies, it is crucial to first answer the question of who is *authorized* to conduct the desired operations. The first step in this process requires an understanding of which individuals—"categories of performers"—are available. This chapter sets the foundational knowledge by breaking down each category of performer as outlined by U.S. Code (U.S.C.) Title 10 (hereafter referred to as "Title 10"), DoDIs, and/or Department of Defense Directives (DoDDs). For this paper, three primary categories were analyzed: (1) uniformed military personnel, (2) government service civilian (i.e., "GS") and (3) contracted support (i.e., "contractor"). Military personnel include the subcategories of enlisted and officer.[12] A basic understanding is required before Chapter 3's review of statutory guidance and legal constraints to provide a foundation for future analysis. For those intimately familiar with these categories, the summary of this chapter provides several key takeaways applicable to the further analyses within this paper.

A. Uniformed Military Personnel

In general, uniformed military personnel must be physically qualified for active service and be of good moral character.[13] Albeit somewhat vague in concept, DoDI 1304.26 does outline specific requirements and/or further references for each of these criteria. The following paragraphs provide specific requirements for each of the military personnel subsections.

1. Enlisted

The enlisted force establishes the backbone of the Service because it consists of the majority of each Service's respective force structure. Requirements for enlistment are designed as inclusive, while primarily targeting young adults about to begin their careers (eligibility starts at 17 years old). The door for citizenship is also opened, allowing not only American citizens, but also those "lawfully admitted to the United States for permanent residence" or those described in one of several "compacts" (i.e., international agreements (IAs)).[14] These compacts include "… the Compact of Free Association between the Federated States of Micronesia and the United States, the Compact of Free Association

[12] Officers include the subcategories of limited duty officer (LDO) and warrant officer (WO).

[13] Department of Defense, "Qualification Standards for Enlistment, Appointment, and Induction," DoDI 1304.26 (Washington, DC: USD(P&R), September 20, 2005), 8, http://dopma-ropma.rand.org/pdf/DODI-1304-26.pdf. The reason for good moral character is defined as follows: "The military Services are responsible for the defense of the nation and should not be viewed as a source of rehabilitation for those who have not subscribed to the legal and moral standards of society at large."

[14] Ibid., 7.

40 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

between the Republic of the Marshall Islands and the United States, or the Compact of Free Association Between Palau and the United States. However, the Secretary concerned may authorize the enlistment of a person not described above if the Secretary determines that such enlistment is vital to the national interest."[15] In terms of education, "a high school diploma is desirable, although not mandatory, for enlistment."[16]

2. Officer

While the employment and management of officers vary between the Services, only an officer can command troops and exercise associated command authorities.[17] As defined by DoDI 1310.02, a Commissioned Officer is defined as "An officer in any of the military Services in the Department of Defense who holds a grade and an office under a commission signed by Presidential authority, and who is appointed as a Regular or a Reserve officer."[18] Officers must be a citizen of the United States and be able to complete 20 years of active commissioned service prior to their 62nd birthday.[19] With a few rare exceptions, a baccalaureate degree is also a prerequisite for officers.[20]

a. Navy Limited Duty Officer (LDO)

As a subset of the officer corps, the Navy's LDO corps includes ranks of O-1 to O-6. However, while these officers fill management, leadership, and command positions commensurate with their rank, their associated career fields require technical background and skills that cannot be attained through normal development.[21] LDOs are currently

---

[15] Ibid., 7.

[16] "A person who is not a high school graduate may not be accepted for enlistment in the Armed Forces unless the score of that person on the Armed Forces Qualification Test (AFQT) is at or above the thirty-first percentile; however, a person may not be denied enlistment in the Armed Forces solely because he or she does not have a high school diploma if his enlistment is needed to meet established strength requirements." See Armed Forces, 10 U.S.C., Volume I § 520 (Washington, DC: U.S. Government Printing Office, July 2011), http://armedservices.house.gov/index.cfm/files/serve?File_id=7C199E0E-1614-497F-A818-B5D5B4BF33B5.

(With respect to a person who has been lawfully admitted to the United States for permanent residence or for a United States national otherwise eligible for appointment as a cadet or midshipman when the Secretary determines that the national security so requires, but only for an original appointment in a grade below O-4).

[20] Department of Defense, "Qualification Standards for Enlistment, Appointment, and Induction," DoDI 1304.26, 7. US Code Title 10, section 12205 states Baccalaureate degree is required for Reserve and National Guard officers O-2 and above.

[21] United States Navy, *The Limited Duty Officer and Chief Warrant Officer Professional Guidebook,* NAVPERS 15627A (Arlington, VA: Bureau of Naval Personnel, 2011 Edition (Updated 2013)), 2-1,

41 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

chosen from the enlisted ranks and must first demonstrate technical proficiency in their respective career fields. Sailors are not eligible to become an LDO until they are at least an E-6 for a period of 1 year (and with all E-7 eligibility requirements met).[22] Since they are selected from the enlisted corps, LDOs do not necessarily require a baccalaureate degree and though current policy restricts LDO accession from the enlisted ranks, this is not required by law.[23]

b. Warrant Officer (WO)

Another technically focused subset of the officer corps is the WO. As described by the Department of the Army, WOs make up the technical foundation of the associated Service; however, unlike traditional commissioned officers who focus on commanding troops and who staff duty positions, WOs are solely focused on their chosen career specialty.[24] In Navy parlance, "Warrant officers 'bridge the gap' between the enlisted and technician level and other officers, thereby improving the efficiency and effectiveness of the organization."[25] Sitting within the force structure between the most senior non-commissioned officer (NCO) (E-9) and the most junior commissioned officer (O-1), an appointment as a WO holds similar requirements to that of a commissioned officer.[26] A WO is typically appointed to rank of W-1 while the ranks of Chief Warrant Officer (W-2 through W-5) receive commissions similar to the traditional officer corps.[27] Under Title 10 authority, "… a warrant officer may be assigned to perform duties that necessarily include those normally performed by a commissioned officer."[28] Therefore, a WO can hold the position of command and exercise the associated authorities of that command.

42 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

1) Army

Comprising 15% of its officer corps, the Army represents the largest WO corps within DoD.[29] Although WOs are typically selected from the non-commissioned officer corps (usually Sergeant, E-5 and above) direct accessions are possible (e.g., aviation).[30]

2) Navy

Selected from the senior enlisted force, Sailors are only eligible upon serving time as a Chief Petty Officer (E-7 through E-9).[31] In contrast to the Army's WO program, the Navy abolished the rank of W-1, and Sailors are commissioned directly into the rank of Chief Warrant Officer-2 (CWO-2).[32] Also of note, the Navy had a flying WO program that targeted younger enlisted Sailors; however, in 2013, it was terminated after 6 years when it was deemed that the needs of the Navy had changed and that "the long-term impact of keeping it going would hurt both the people and the Service."[33]

3) Air Force

While the Air Force discontinued its WO program in 1959 for a myriad of reasons, including the reduction overhead/gaining efficiencies within the Air Force technical structures by eliminating an entire personnel management system, the WO ranks are still authorized by Title 10.[34] This current IDA paper acknowledges the lack of an Air Force WO force structure, along with the additional overhead required to establish such a program. Although options to use WOs within an UAS program are analyzed, the constraints associated with the Air Force's force structure are applied to the subsequent cost/benefit analysis.

B. DoD Civilian

A DoD civilian is typically defined as a federally appointed employee by U.S.C. Title 5, Government Organization and Employees. These individuals are appointed into the civil

43 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

service and are "engaged in the performance of a Federal function under authority of law or an Executive act" and, for this paper, are subject to the supervision of either a member of a uniformed Service and/or another government civilian while in this role.[35] It is also important to note, that in some cases (e.g., defense intelligence activities) government civilians are also appointed under Title 10 authorities.

DoDD 1404.10 outlines a specific subcategory of DoD civilians who are "typically away from normal work location of DoD civilians, or in situations where other civilians may be evacuated to assist military forces where the use of DoD civilians is appropriate."[36] These civilians are members of the DoD expeditionary workforce. The directive states further that this portion of the workforce "shall be organized, trained, cleared, equipped, and ready to deploy in support of combat operations by the military; contingencies; emergency operations; humanitarian missions; disaster relief; restoration of order; drug interdiction; and stability operations …."[37]

Statutory guidance directs the expeditionary workforce to be organized, trained, and equipped for contingency operations. However, research revealed that while this category of performer is extremely relevant to UAS operations, in many cases the current expeditionary workforce structure is based upon a loose collection of volunteers who are needed to fill deployed administrative functions and who are trained on an add-needed basis.[38] Despite the apparent discourse between reality and statutory guidance, subsequent analysis will focus on the applicability of such a workforce to UAS operations.

C. DoD Contractor

U.S.C. Title 5 defines a DoD contractor as an independent individual and/or company that has been contracted by or on behalf of DoD to accomplish a DoD-related function.[39]

---

[35] Government Organization and Employees, 5 U.S.C. § 2105 (Washington, DC: U.S. Government Printing Office, March 2008), http://www.gpo.gov/fdsys/pkg/CPRT-110HPRT38035/pdf/CPRT-110HPRT38035.pdf. Other supervisors listed by Title 5 include the President, Members of Congress, heads of Government-controlled corporations, or an adjutant general designated by the concerned Secretary under section 709(c) of title 32.

[39] Government Organization and Employees, 5 U.S.C. § 552a (3)(m)(1). Although this section deals with administrative records-keeping, it provides a simple and clear definition of a government contractor.

44 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

D. Summary

While the delineations outlined in this chapter are relatively well known, the following points are key takeaways applicable to the further analyses provided in this paper:

- Only uniformed military officers can hold positions of command (this includes LDOs and WOs).
- LDOs and WOs are subcategories of the officer corps used by some Services to focus on and capture long-term technical expertise.
- The Air Force lacks a WO force structure and, although authorized by Title 10, requires additional overhead to establish such a program. Similarly, the Navy lacks a flight WO program.
- The DoD expeditionary workforce is defined as a DoD civilian subcategory that is organized, trained, and equipped for expeditionary operations.

45 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

3. Statutory Guidance Review: Workforce Mix

This chapter summarizes the analysis of standing statutory guidance to help answer the question of who is *authorized* to conduct DoD UAS operations.[40] Many assume that since DoD already uses uniformed military personnel and contractors for UAS operations, this question is a moot point. However, as outlined in Chapter 1, possible UAS missions are so broad in scope that there may be potential to structure a force by delineating categories of performers and mission requirements. Therefore, it is imperative that we understand the statutory and legal rationale. Specifically, analysis will develop a framework for UAS workforce determination, address concerns about which part of the operation/task is inherently governmental (IG), discuss how military incumbency is determined, and finally show how risk mitigation factors into the decision making process.

A. Workforce Mix Determination Framework

To answer the *who* question requires not only understanding the category of performers, as described previously, but also a working understanding of the associated DoD force structure constraints. Phrased as the "Workforce Mix," statutory guidance is primarily provided from Title 10, DoDD 1100.4 ("Guidance for Manpower Management"), and DoDI 1100.22 ("Policy and Procedures for Determining Workforce Mix"). While Title 10 outlines specific requirements in terms of generic missions (armor, infantry, strategic airlift, and so forth), it does not direct any one Service to specifically maintain a UAS capability.[41] Also, Title 10 does not direct a specific category of performer to conduct UAS operations.[42]

[40] Appendix A provides the additional detailed background analysis.

[41] Example: Title 10, Volume III § 3062 and § 8062 outline Congress' intent for the Army and Air Force, respectively, and, in some cases, outline generic structure (e.g., Army branches). However, it does not dictate a UA program. See Armed Forces, 10 U.S.C., Volume III § 3062 and § 8062.

[42] For example Title 10 § 8067 dictates that Medical, Judge Advocate, and Chaplain services be performed by officers. There is no such designation for UA programs or even for pilots in general. This current IDA paper does not advocate for such direction, but rather highlights the lack of Title 10 restrictions for an unrestricted development of alternative strategies within the constraints of existing generic manpower guidance. See Armed Forces, 10 U.S.C., Volume III § 8067

46 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

Title 10

- Does NOT direct any singular Service to maintain a UAS program
- Does NOT direct a specific category of performer to conduct UAS operations.
- Does NOT prescribe a percentage of force and/or rank to support UAS.

Lacking specific Title 10 guidance toward a UAS force structure, DoDD 1100.4 outlines how to implement Title 10 and congressional guidance when determining the appropriate category of performers for military operations. The document is based upon the following guiding principle:

> National military objectives shall be accomplished with a minimum of manpower that is organized and employed to provide maximum effectiveness and combat power.[43]

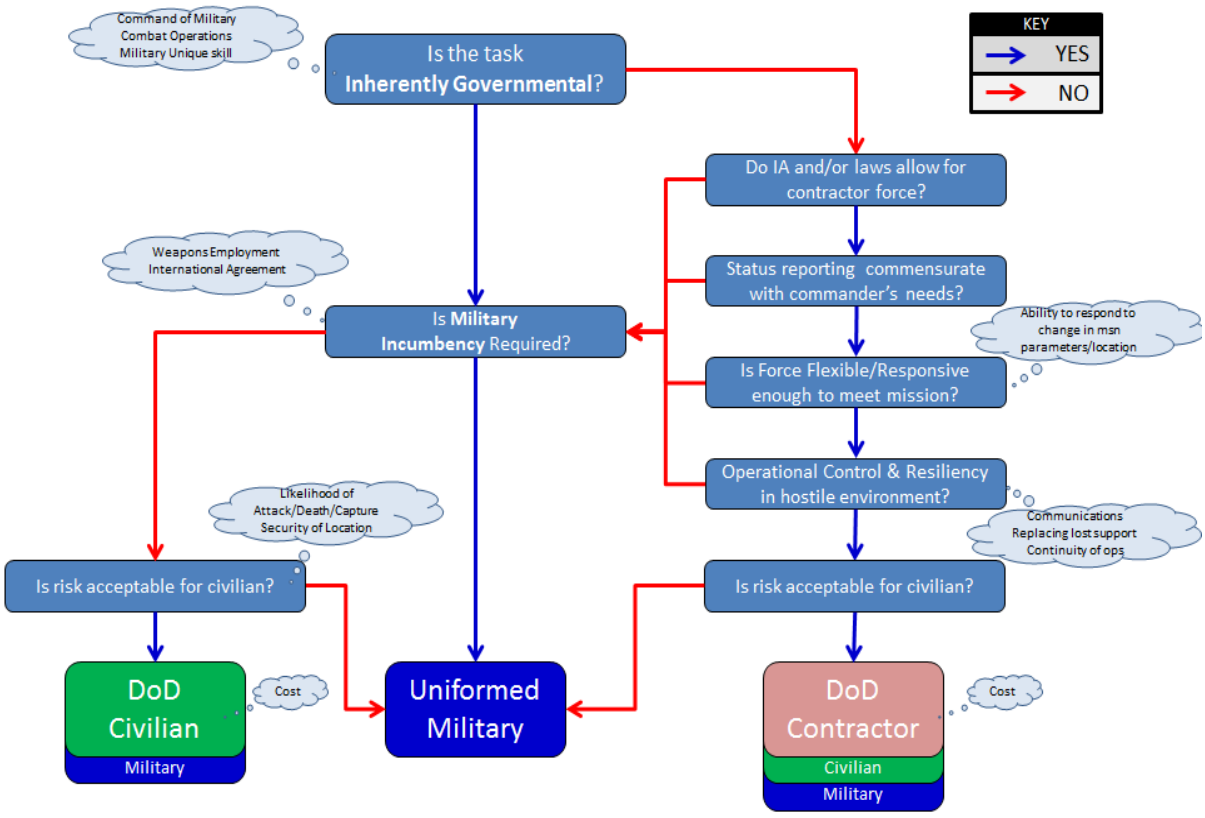
Manpower guidance found within DoD manning directives and instructions outline several requirements for analysts to follow when determining workforce mix. As part of these principles, the guidance directs analysts to not only consider mission requirements and associated risk, but also to consider all available sources of manpower and that "assigned missions shall be accomplished using the least costly ***mix*** of personnel."[44] For this paper, the previous guidance is distilled into three guiding principles:

UAS Program Alternative Staffing Guiding Principles

- Manpower costs should be minimized to provide optimal effectiveness and combat power.
- Risk mitigation takes precedence over cost savings when necessary to maintain control, capabilities, and/or readiness.
- No single category of performer solution necessarily works best. A ***mix*** must be analyzed.

[43] Department of Defense, "Guidance for Manpower Management," DoDD 1100.4, 2.

[44] Ibid., (emphasis added).



47 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

While there are many intricacies associated with manpower analysis, this paper distills the applicable DoD statutory guidance into the following three overarching questions in terms of the UAS task in question:

Force mix Analysis Questions

- Is the task inherently governmental?
- Is military incumbency required?
- Is the level of risk to force acceptable for civilians?

Using these questions as a framework, the decision tree depicted in Figure 2 was developed to analyze potential staffing alternatives. While this generic roadmap is a simplification of the overall requirements, it will help find an appropriate balance across UAS missions and associated forces.

Note: Subsequent analysis further breakdowns the military component into officer and enlisted subcategories.

Figure 2. Category of Performer Decision Tree

48 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

B. Inherently Governmental (IG)

As seen in the decision tree in Figure 2, the first determination made is whether the task at hand is IG. This determination is based on the DoDI 1100.4 constraint that states,

> Functions that are inherently governmental shall not be contracted.[45]

In an attempt to condense associated guidance, DoD updated DoDI 1100.22, "Policy and Procedures for Determining Workforce Mix," in 2010 as an attempt to clarify the "manpower mix criteria and guidance for risk assessments to be used to identify and justify activities that are inherently governmental (IG)"[46] This guidance consolidated previous direction and stands as the DoD standard for determining what is IG.[47]

> ***Inherently Governmental (IG) Activities***
>
> In general, a function is IG if it is so intimately related to the public interest as to require performance by Federal Government personnel. IG functions shall include, among other things, activities that require either the exercise of substantial discretion when applying Federal Government authority, or value judgments when making decisions for the Federal Government ….[48]

While DoDI 1100.22 provides in-depth detail for manpower analysts to determine what is and is not IG, the following summary distills this information into issues applicable to this UAS study. Within this summary, key criteria elements are separated into those that are mission related and those that are risk related.

[45] Ibid., 3.

[47] Ibid., 2.

[48] Ibid., 13.

49 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

Key Criteria: IG Determination[49]

- **Mission-Focused Criteria**
  - Command of military forces
  - Operational control of combat, combat support, and combat service support units
  - Conduct of combat operations
  - Peacetime commercial function that, in the event of a contingency, is required to mobilize and conduct an IG function
  - Ultimately accountable for accomplishment of missions and/or discretionary exercise of DoD authority
  - Military-unique knowledge and skills
- **Risk-Focused Criteria**
  - Security in hostile or volatile areas
  - Threat level could increase and military personnel would be needed on short notice to provide or augment a military capability
  - Unsafe number of personnel in hostile area who are not combatants
  - DoD civilians/contractors will not/cannot continue to perform work
  - Enemy or hostile force encounter would likely lead to hostilities
  - "Emergency-Essential" manpower … continuity of ops for essential functions

One caveat to the IG determination is for those tasks which are previously identified as core capabilities for critical operations. DoDI 1100.22 states, "…DoD Components shall review the function to verify whether the work should be performed by government personnel to provide a core capability for readiness or risk mitigation purposes, or for continuity of operations."[50] If a function is determined as such a core capability, the workforce mix determination is determined as inherently IG and the decision is then between DoD Civilian or uniformed military categories of performers.

When assessing UAS program manpower and the IG determination, one must keep in mind the UAS program alternative staffing guiding principle that states that "no single category of performer solution necessarily works best." Therefore, analysis will not only look at individual mission sets, but will also focus on individual tasks within those missions to analyze a mixed/total force options that will provide the appropriate balance of military, civilian, and contractor.[51]

---

[49] Appendix A provides additional information describing the specific criteria.

[50] Department of Defense, "Policy and Procedures for Determining Workforce Mix," DoDI 1100.22, 49.

[51] While the Reserve Component plays a major role in the total force discussion, the analysis of an Active/Reserve mix was beyond the scope of this paper and has been covered in multiple other studies.

50 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

C. Military Incumbency

As depicted in Figure 2, upon determination of a task as IG, military incumbency must be assessed. Contrasting the IG determination, the requirements supporting this decision are rather straightforward. The first step is determining the following: Is an IA in place (e.g., Status of Forces Agreement (SOFA)) that requires only uniformed military members to conduct this operation? Next, does the mission require the employment of, or terminal guidance of, kinetic weapons? Although the statutory guidance does allow for each category of performer to employ lethal force under certain conditions, for those personnel not in active military service, employing lethal force is limited to self-defense.[52] Since the employment of weapons in combat is IG, the following is a key tenet to the remainder of the paper:

> UAS Operations that include the employment of, and/or provide terminal guidance to, kinetic weapons require **uniformed military personnel**.

In addition to weapons employment, analysis indicates that UAS aircrew/operators who provide direct support to forces actively engaged in hostilities also requires support from uniformed military personnel.[53] Therefore, the following definition of military incumbency is used for the remainder of this analysis:[54]

> UAS military incumbency is indicated when an aircrew/operator position:
> - Requires **employment/terminal guidance** of kinetic weapons,
> - Provides **direct support** to forces that face the potential of, or are directly engaged in **armed hostilities** and/or
> - An **IA** requiring use of uniformed military members to conduct operations in host country.

[52] Although somewhat overly simplified, this paper will limit the discussion of UAS weapons employment to those weapons that are offensive in nature. Appendix A contains further background discussion on the use of Self-Defense Rules of Engagement (ROE).

[53] See Appendix A for background analysis.

[54] Although this somewhat oversimplifies the issue, other intricacies are addressed in the assumption of risk analysis. Appendix A provides additional information on what entails "direct support" for UAS aircrew/operators.

51 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

D. Risk Assessment

Assessing the risk to the force is the most ambiguous decision of this analysis. While Figure 2 shows risk analysis as one of the final decision points, it is really imbedded throughout the decision tree. This risk analysis is based on the Commander's best military advice from the information that he/she is given at that time. DoDI 1100.22 stresses the importance of analyzing risk when determining the workforce mix.

> Risk mitigation shall take precedence over cost savings when necessary to maintain appropriate control of Government operations and missions … the Defense workforce shall have sufficient flexibility to reconstitute or expand the capabilities of the military Services on short notice to meet a resurgent or increased threat to U.S. national security. Accordingly, risk mitigation shall take precedence over cost savings when necessary to maintain core capabilities and readiness.[55]

With this in mind, the factors behind this decision could easily change during an operation, and that potential must also be included in the Commander's assessment. As such, the Commander is asking two questions: (1) What is the likelihood that this force will come under direct engagement with the enemy (i.e., risk of injury, death and/or capture), and (2) what is the likelihood that this force will have to pick up arms (includes self-defense considerations)? If either likelihood is "high" and/or in the Commander's belief is beyond the acceptable risk for a civilian force, uniformed military members are required.

DoDI 1100.22 also directs that when addressing the possible use of contractors, risk should be considered "to preclude ceding governmental control and authority of IG functions to the private sector where there is insufficient public **accountability and transparency**."[56] It also discusses analyzing the operational/logistical footprint associated with various workforce mix solutions since an overly large footprint could limit flexibility and introduce an unacceptable level of risk.[57] The following list summarizes the applicable risk factors to the analysis of UAS program staffing strategies.[58]

---

[55] Department of Defense, "Policy and Procedures for Determining Workforce Mix," DoDI 1100.22, 2.

[56] Ibid., 46 (emphasis added).

[57] Ibid., 53.

[58] Appendix A provides additional information describing the specific criteria.

52 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

IG Risk Assessment Factors

- Accountability and transparency
- Operational and logistical footprint
- Readiness reporting
- Replacing lost support
- Continuity of operations during hostilities
- Operational control in hostile environments
- Flexibility and responsiveness
- Discipline authority
- Restrictions due to laws and IAs

When looking down the "right side" of the category of performer decision tree (see Figure 2), risk must also be assessed in terms of the force's flexibility/responsiveness. While risk is inherent in deployed military operations, which include forward-deployed UAS elements, operating concepts enable some UAS to control missions from the Continental United States (CONUS) thereby decreasing the risk to force. It is important to understand not only who can deploy, but where and into what conditions each category of performer can deploy. While there are provisions that allow all three categories to deploy, there are key considerations for DoD civilians and DoD contractors.[59]

[59] The assumption is that uniformed military personnel are not restricted from deploying where tasked by DoD. Since all three categories of performers can deploy, "ability to deploy" is not included in the decision tree framework; however, elements of this factor must be included when considering both risk and cost.

53 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

For civilians, DoDI 1404.10, "DoD Civilian Expeditionary Workforce," provides the primary statutory guidance associated with this category of individuals and states that they will be included in the DoD Global Force Management process and that it will reflect designation of:[60]

> **DoD civilian employees as the preferred sourcing solution** when appropriate for **non-warfighting** Combatant Command request for forces and requests for capabilities, and Joint Individual Augmentation requirements on Combatant Command Joint Manning Documents for r**ecurring and emergent mission requirements**.[61]

DoD contractors are also able to deploy in support of contingencies; however, the level of that support and associated responsiveness/robustness is often tied to significantly increased dollar amounts. DoDI 3020.41[62] is the primary source for using a contracted force in such operations. It outlines how "contracted services may be utilized in applicable contingency operations for all functions **not inherently governmental** [and that] contractor personnel may be utilized in support of such operations in a non-combat role as long as contractor personnel residing with the force in foreign contingencies have been designated as CAAF [contractors authorized to accompany the force] by the force they accompany ….[63] The CAAF designation provides contractor personnel Geneva Convention Prisoner of War protections in the event of capture; however, the instruction stresses the fact that such contractors face the "**risk of injury or death** incidental to enemy actions while supporting military operations."[64] Much of the subsequent discussion in this instruction (DoDI 3020.41) mirrors the factors discussed in the previous risk consideration. While contractors can provide support functions such as maintenance, private security (in

---

[60] While DoDI 1404.10 provides the guidance for the Expeditionary workforce, as discussed in Chapter 2, there is an apparent discourse between reality and statutory guidance. The individuals are typically a loose collection of volunteers used to fill deployed administrative functions (trained on an as-needed basis) rather than specifically organized trained and equipped.

[61] Department of Defense, "DoD Civilian Expeditionary Workforce," DoDI 1404.10, 3 (emphasis added). Some associated constraints with this force are that those personnel designated as expeditionary workforce are susceptible to expeditionary assignments in 6-month rotational periods and that an individual's deployment tour shall not exceed 2 years. While this rotation is not significantly different from rotational goals associated with uniformed military personnel, it must be considered when assessing the right size and costs associated with the use of DoD civilian expeditionary workforce personnel.

[62] Department of Defense, "Operational Contract Support (OCS)," DoDI 3020.41 (Washington, DC: USD(AT&L), December 20, 2011), http://www.dtic.mil/whs/directives/corres/pdf/302041p.pdf.

[63] Ibid., 9 (emphasis added).

[64] Ibid., (emphasis added).The instruction does make a point that CAAF status does not apply to contractor personnel supporting domestic contingencies.

54 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

some specific cases), billeting, and so forth, they are often bound by the laws of the host nation and could lose CAAF status depending "on where they are detailed to work by their employer or on the provisions of the contract."[65] Examples of limiting factors that a contracted force may be held to host nation laws include, "labor worker permits; workforce and hour restrictions; medical, life, and disability insurance coverage; taxes, customs, and duties; cost of living allowances; hardship differentials; access to classified information; and hazardous duty pay."[66] Finally the instruction highlights a key limiting factor for the contracted force, logistics:

> Contractors are generally responsible for providing their own logistical support. However, in austere, uncertain, and/or hostile environments, the DoD may provide logistical support to ensure continuation of essential contractor services.[67]

Armed with the basic framework outlined by the category of the performer decision tree (see Figure 2), Chapter 4 summarizes the current methodologies that each of the Services uses. Understanding what is currently used not only allows further analysis into any common practices applied among the Services, but also helps to identify associated gaps between statutory guidance and practice that the follow-on analysis of alternatives can address.

4. Current Service Practices

Each Service has a unique perspective on the purpose and associated mission set of its UAS programs. This chapter will list each of the Services to show the missions associated with UAS, how the UAS are employed, and how each Service presents its UAS forces. Chapter 5 provides the analysis comparing these programs. Table 2 depicts the UAS programs analyzed in this paper.

Table 2. DoD UAS Programs Analyzed

Group	Air Force	Army	Navy	Marine Corps	SOCOM
Group 5 • > 1,320 lbs • > FL180	RQ-4 Global Hawk MQ-9 Reaper	NA	MQ-4 Triton	NA	MQ-9 Reaper
Group 4 • > 1,320 lbs • > FL180	MQ-18 Predator	MQ-1C Gray Eagle	MA-8 Fire Scout	NA	MQ-1B Predator MQ-1C Gray Eagle
Group 3 • < 1,320 lbs • < FL180 • < 250 kts	NA	RQ-7 Shadow	RQ-21 Blackjack	RQ-7 Shadow RQ-21 Blackjack	RQ-7 Shadow RQ-21 Blackjack
Group 2 • 21–55 lbs • < 3,500 AGL • < 250 kts	ScanEagle	NA	ScanEagle	ScanEagle	ScanEagle
Group 1 • 0–20 lbs • < 1,200 AGL • < 100 kts	RQ-11 Raven	RQ-11 Raven RQ-20 Puma	NA	WASP RQ-11 Raven RQ-20 Puma	WASP RQ-11 Raven RQ-20 Puma

Note: While this list is not all inclusive, it does incorporate the more prominent programs and constitutes a majority of DoD UAS programs of record.

Detailed analysis into the effectiveness of the Service's force presentation is not provided; however, this chapter concludes with a summary of common practices and/or associated gaps between the representative staffing methodologies.[68]

A. Joint UAS Requirements

While this paper refrains from an in-depth review of training and employment practices, a synopsis of the minimum joint UAS training standards is applicable to subsequent

[68] As with many rapidly developing programs, the exact numbers of aircraft and manpower associated with each program changed rapidly—even during the research for this paper. While the data contained within were current as of the research date, these changes are problematic for analyses when attempting to stick to specific manpower program levels. Therefore, this chapter and subsequent analyses will maintain a general program overview rather than chase "current" program levels. Specificity is provided where appropriate, but, for this paper, the importance lies in the analyses of the policies and their application to individual Service UAS programs to provide a long-term view applicable to all UAS programs, not just those currently in service.

56 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

analyses. Chairman of the Joint Chiefs of Staff Instruction (CJCSI) 3255.1[69] is the guideline "to ensure the requisite knowledge, skills and abilities are addressed appropriately."[70] These standards were developed to meet or exceed Federal Aviation Administration (FAA) requirements in an effort "to facilitate UAS access into the National Airspace System (NAS)."[71] CJCSI 3255.01 guidance sets a basic UAS qualification (BUQ) and a joint mission qualification (JMQ). The BUQ details the "general aviation knowledge and UAS knowledge-based skills to operate a UAS safely as required by crew duties or position (i.e., Pilot/Aircraft Operator)."[72] The BUQ level directly correlates to the NAS and/or International Civil Aviation Organization (ICAO) airspace in which the pilot is expected to operate, depicted as follows:[73]

BUQ Level-I. Knowledge and knowledge-based skills required to fly VFR [Visual Flight Rules] in Class E, G, and Restricted/combat airspace <1,200 ft. AGL [altitude above ground level]. [**FAA Equivalent:** FAA requirements do not currently exist for this group of aircraft.]

BUQ Level-II. Knowledge and knowledge-based skills required to fly under VFR in Class D, E, G, and Restricted/combat airspace <18,000 ft. MSL [mean sea level]. [**FAA Equivalent:** Sport Pilot]

BUQ Level III. Knowledge and knowledge-based skills required to fly under VFR in all classes of airspace *except U.S. and ICAO Class A.* [**FAA Equivalent:** Private Pilot]

BUQ Level IV. Knowledge and knowledge-based skills required to fly *VFR/IFR [Visual Flight Rules/Instrument Flight Rules] in all weather conditions and classes of airspace up to FL600 [flight level 600]*. [**FAA Equivalent:** Private Pilot with Instrument rating]

[72] Ibid., 2.

[73] Ibid., A-2 (emphasis added). BUQs are cumulative (e.g., to achieve a BUQ III, a pilot must also meet BUQ I and II requirements). The BUQ requirements meet or exceed the requirements of their FAA equivalents (as described by the 14 Code of Federal Regulation (CFR).

57 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

A detailed comprehension of airspace classification (A–G) is not necessary other than understanding that Class A is the most restrictive (e.g., international airports and civilian airliner airways), Class D is found at many smaller airports and military airfields, and Class G is the least restrictive (e.g., rural farm land).

CJCSI 3255.01 also dictates JMQs to "provide general knowledge of the UAS mission/objective … to ensure [that] the crews understand their role in accomplishing a larger military objective."[74] The three JMQ levels are as follows:[75]

> **JMQ-A.** These qualifications support **unit-level ISR and Fires** tasks in support of the JFC. Mission support with capabilities defined in the JMTL [Joint Mission Task List].
>
> **JMQ-B.** These qualifications support **theater-level advanced ISR/IAA [Intelligence, Surveillance, and Reconnaissance/Incident Awareness and Assessment]** mission support with defined capabilities in the JMTL of the JFC.
>
> **JMQ-C.** These qualifications support **strategic level Fires and CSAR/PR [combat search and rescue/personnel recovery]** tasks in support of the JFC as defined in the JMTLs.

The nuances between these (**bold texts**) are significant because they show the level of anticipated mission execution, which ties directly into how the Services view their respective UAS crew forces. Like the BUQs, the JMQs are cumulative in nature.

CJCSI 3255.1 goes one step further in tying the BUQ and the JMQ as minimum standards to each of the previously described UAS classifications (Groups 1–4).

1	I	Restricted/combat <1,200 ft. AGL VFR, Class E and G		

B. Air Force

The Air Force's UAS efforts focus on Group 4/5 UAS, which the Air Force refers to as RPA.[77] The Air Force operates and maintains these assets within DoD and, as with most Air Force aircraft, RPAs are viewed as operational/strategic assets whose support is typically focused regionally rather than in a direct support role to any single unit.[78] While the focus of the Air Force is primarily on RPAs, the 2014 RPA Vector report does reemphasize "the inherent potential and emerging capabilities of small unmanned aircraft systems (SUAS),"[79] the term that the Air Force uses for UAS Groups 1–3. The overall vision is for the Air Force to tie RPAs and SUAS together into a family-of-systems approach that is agile and responsive to the JFCs requirements.

1. Applied Missions

The Air Force's five core missions are as follows:

- Air and Space Superiority,
- ISR

[76] JMQ C (strategic level fires and CSAR/PR) is not set as a minimum requirement by CJCSI 3255.1; however, it is used as the minimum standard for the Air Force MQ-1/9.

[77] United States Air Force, *RPA Vector: Vision and Enabling Concepts 2013–2038*, 13.

[78] While RPAs can indeed provide direct support to a specific unit, they are typically launched to support multiple units during a single sortie, thereby maximizing collection requirements within their area of responsibility.

[79] United States Air Force, *RPA Vector: Vision and Enabling Concepts 2013–2038*, 12.

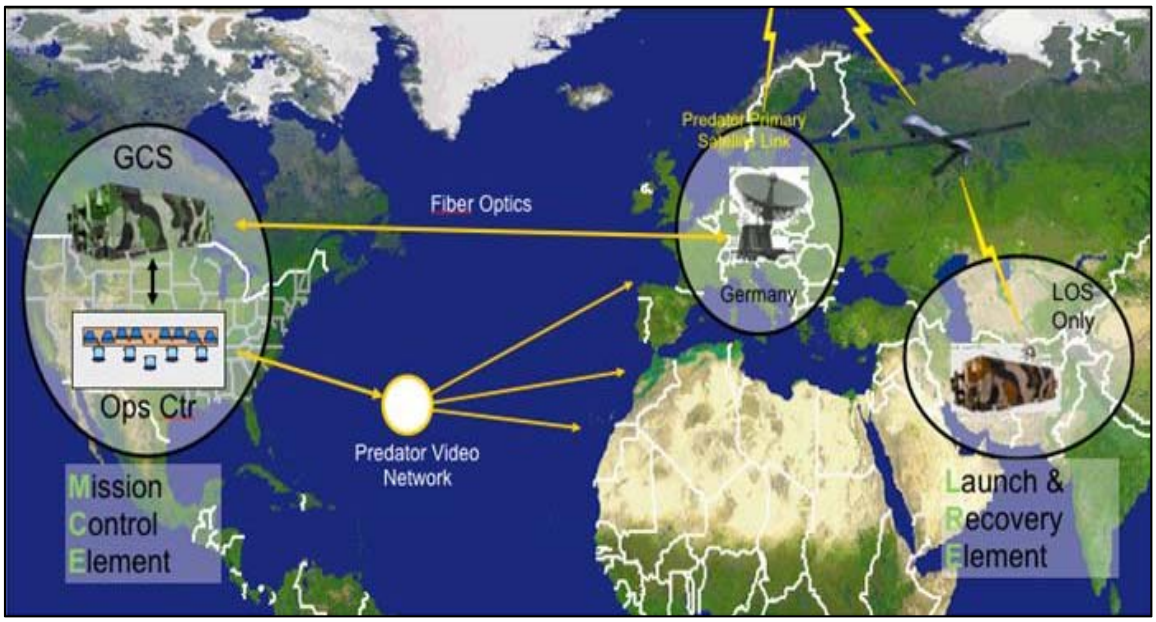
59 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

- Rapid Global Mobility,
- Global Strike, and
- C2.

While the primary focus of the Air Force's UAS program is focused on ISR and Global Strike, Air Force RPAs have a role in providing Air and Space Superiority and C2. The 2014 RPA Vector report depicts a vision in which these missions will continue to expand and in which future RPA programs will broaden to consider global mobility in missions such as cargo movement and air refueling.[80] While RPA have been used in "atypical" military missions, such as humanitarian relief and/or support to non-governmental agencies, the core Air Force missions flown today focus on close air support (CAS), ISR, CSAR, and strike coordination and reconnaissance (SCAR). While these missions are similar to those performed by UA in the other Services, the Air Force has a global commitment. Even when regionally assigned (e.g., Afghanistan), Air Force RPAs are tasked to support multiple teams during their often 20+-hour flights. These aircraft are also responsible for adjusting mission focus depending on which ground force they are supporting at that time. Within a single flight, Air Force RPAs can go from basic ISR collection, to convoy protection, to C2 relay, to providing CAS and associated precision weapons employment—all for several different ground component commanders.

In contrast, the Air Force's SUAS force is currently used at the tactical level in support of battlefield airmen and security forces. Similar to that of the other Services' tactical ground units, these UA are used for point security or short-duration missions to provide a unique vantage point typically unavailable at the small-team level. While the team missions can vary from humanitarian assistance to support of direct fire missions, SUAS are kept at the tactical unit support level.

2. Employment Concept



Air Force RPA fly in support of global operations 24 hours a day, 7 days a week, 365 days a year (24/7/365), primarily from bases stationed in CONUS. Figure 3 depicts this extensive communication infrastructure referred to as remote split operations (RSO). While a small contingent is required to deploy in support of launch and recovery operations, most of the Air Force RPA crew force remain CONUS. This approach provides the benefits of minimizing forward-deployed forces and decreasing the number of rotational forces required.[81]

---

[80] Ibid., 18.

[81] "Deployed-in-garrison" construct was noted as creating challenges between balancing combat operations and typical in-garrison duties. While several studies address this topics, this paper will focus on the manning construct from an effectiveness, mission risk, and cost perspective.

60 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

Source: 3rd Special Operations Squadron Unit Capabilities Brief, CAO February 2011 (author's personal files).

Figure 3. Air Force RPA RSO

3. Force Presentation Model: Uniformed Military

The Air Force uses the Squadron as the primary unit responsible for provided UAS capability to the JFC. Air Force RPA support is quantified by the number of Combat Air Patrols (CAPs) provided. A CAP is a singular aircraft that is airborne over a designated objective(s), where the measure of CAPs is typically assessed by how many CAPs can be provided globally at any one time.[82] The typical active duty MQ-1/9 Squadron construct is to support five CAPs, while the reserve component squadron construct can support up to three.[83] Since these operations run "24/7/365," the Air Force currently applies a 10:1 crew ratio to their MQ-1/9 pilot and sensor operator positions. This translates to 10 pilots and 10 sensor operators for each CAP for which a squadron is responsible.[84] For RQ-4

[82] Current Air Force program provides 65 total RPA CAPs, which includes MQ-1, MQ-9, and RQ-4.

[83] United States Air Force, *RPA Vector: Vision and Enabling Concepts 2013–2038*, 16.

[84] In trying to grasp the number of individuals associated with a single aircraft, it is helpful to see a single RPA aircrew as 20 people (10 pilots, 10 sensor operators who operate 24/7/365 operations), thereby manning Air Force RPA at a crew-to-CAP ratio of 1:1. In this manner, it becomes analogous to other aircraft (yet other aircraft provide significantly less time airborne and do not provide 24/7/365). For example, an AC-130H gunship has 14 crew members, and an E-8C Joint Surveillance Target Attack Radar System (JSTARS) has between 21 and 34 crew members, depending on mission length. Also of note, an Air-Force-conducted manpower study, which reportedly validates Air Force RPA crews' claims that an increase in the crew-to-CAP ratio is actually required, was expected for official release end of February/beginning of March 2015.

61 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

operations, this ratio is 15:1.[85] While the RSO construct eliminates the need for rotational forces, this manpower ratio is still required to meet the requirements to enable leave, days off, administrative duties, continued professional development (e.g., professional military education), and so forth. Since the reserve component must maintain a balance between its full-time active guard and reserve (AGR) and part-time traditional reservist (TR) positions, the manning construct is somewhat different. A typical three-CAP squadron has 56 positions per crew, balanced between 15 AGR and 41 TR positions.

In terms of category of performers within the RPA force, the Air Force uses rated officers for pilots and enlisted personnel for sensor operators.[86] The Air Force contends that the level of responsibility placed upon its pilots is associated with those traits of a commissioned officer. Rated RPA pilots come from two sources: (1) the undergraduate RPA training pipeline or (2) those rated officers who completed the traditional undergraduate pilot training (UPT) and previously flew a manned platform before their RPA tour. The goal is for RPA training pipeline pilots, whose training presents a 95% cost savings over their traditionally trained pilot training counterparts, to eventually comprise most of the force.[87] This career field was developed not only to capitalize on the cost savings associated with shorter training timelines, but also to further professionalize and focus the rated RPA force.

The Air Force's view on RPA operational requirements mirrors that of those associated with typical manned platforms. This view also drives the requirement for RPA sensor operators, who are also awarded an aeronautical rating and associated wings, to train at a level commensurate with their career enlisted aviator counterparts.

[87] Air Education and Training Command, HQ AETC/FMATT, e-mail with author. Costing data from AFI 65-503, "Cost Factors," Table A34-2 *Representative Officer Aircrew Training Costs Variable and Fixed*, 5 March 2014. Air Force Personnel Center RPA managers stated that UPT for a fighter pilot costs approximately $1,463,797 per pilot (T-6, T-38, and Introduction to Fighter Fundamentals) while undergraduate RPA training (URT) only costs $70,446. The cost for UPT graduates designated to fly mobility or refueling aircraft cost $749,354 (URT is 91.6% less costly).

62 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

As stated in the RPA vector,

> While RPA pilots and sensor operators face challenges operating aircraft from a remote shelter (e.g., C2 link latency), the majority of **aircrew skill sets** required (e.g., communication, multitasking, airmanship) **are no different from those required for manned aircraft.**[88]

With this in mind, the Air Force acknowledges that while DoD will determine where and how it will operate its aircraft, the individual Service is responsible for creating qualification training programs necessary to safely accomplish that assigned mission. In terms of UAS, the Air Force's RPA Vector report references the CJCSI 3255.1 standards discussed previously.[89] Based on the Air Force's global requirement, which requires flight within ICAO airspace and the often kinetic (i.e., weapons employment) nature of the RPA mission, Air Force RPA crews are trained at the highest (BUQ-V, JMQ-C) level, thereby exceeding FAA requirements and enabling integrated operations within the national/international airspace structure.

In contrast to the larger RPA, Air Force SUAS are operated at the tactical/team level. Although SUAS operators are individually certified through a unique training program, becoming an operator is a secondary duty for airmen. As stated by the RPA vector,

> SUAS operators (SUAS-O) are not rated pilots but function as the pilots in command (PIC) and are responsible for the safe ground and flight operation of the UA and onboard systems. Air Force SUAS-Os are selected, trained, and certified to act as the PICs of their UA based on mission requirements. SUAS-O qualification does not result in award of an Air Force Specialty Code (AFSC) or a Special Experience Identifier.[90]

Therefore, while SUAS operations come with additional training/currency requirements, these operations do not drive an inherent increase of manpower within the unit.[91] This situation is primarily true now within the Air Force due to the fact that Airmen are only

---

[88] United States Air Force, *RPA Vector: Vision and Enabling Concepts 2013–2038*, 79 (emphasis added).

[89] Ibid.

[90] Ibid., 13.

[91] As technology and capability among the SUAS force increase, this situation could easily change. As described in the 2014 RPA Vector report, there is a reemphasis on SUAS. Elements within the Headquarters Air Force, which is currently drafting an SUAS vector to shape future efforts. As the systems mature, the need for designated SUAS operators (especially in Groups 2/3) could become a reality.

63 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

operating Group 1 UA. Although not a requirement, SUAS operators within the Air Force are typically enlisted personnel, largely due to fact that the career field employing these aircraft (e.g., Security Forces, Battlefield Airmen) is primarily enlisted and is performing operations in local support of its specific unit/team. The Air Force centrally trains RQ-11 operators at a BUQ-II, while individual units assure JMQ-A qualification.[92]

4. Utilization of Contractors

While most of the Air Force UAS program is performed by uniformed military personnel, some support aspects use DoD contractor support. The most prevalent use of contractors is within the deployed maintenance of these systems; however, in some unique cases, the Air Force has contracted UAS flight operations in cases where the demand required an immediate increase in a capability that was not inherent within the existing UAS program. Most notably are those contracts used in support of UAS training operations and where certain special-mission RPA units use contractors to provide deployed launch and recovery operational support.[93] Increases in ISR demand have also led to an increase in government-owned, contractor-operated (GOCO) UAS operations in which the government is able to aptly supply the necessary hardware but is ultimately short the personnel required to conduct combat support operations. For Air-Force-flown aircraft, this situation has presented itself most recently in the use of GOCO MQ-9 operations.

C. Army

In contrast to the Air Force, the Army's UAS program focuses primarily on the smaller Group 1 and 3 aircraft. (The Army does not currently employ Group 2.) Although approximately 92% of the Army's UAS inventory consists of Group 1 UA, it does operate the Group 4 MQ-1C. While the MQ-1Cs are a small portion of the Army's overall fleet (approximately 2%), this capability plays a large part in the Army's overall UAS strategy and brings significant capability to commanders at the lowest level. The level of support varies depending upon the unit to which the UAS is assigned; however, Army UAS operations are typically employed at the tactical level and used in a similar manner to other organic maneuver and fire forces.

---

[92] Air Force SUAS School House Det-Commander, e-mail with the author, February 13, 2015. USAF RQ-11s often operate within Class D airspace in support of the base defense mission.

[93] Multiple interviews with RPA Manpower and Career Development Tiger Team. Training operations at Randolph, Holloman, and Creech Air Force Bases (AFBs) use contractors to augment the active duty force to meet training requirements and increased demand for a larger RPA force. While many of the deployed launch and recovery flight operations are conducted by uniformed military, some Air Force RPA squadrons are supported by contracted launch and recovery elements.

64 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

As documented in the Army UAS Roadmap report, the typical Army echelons are as follows:[94]

> **Battalion-level and lower:** close-range (less than 25 kilometers), short duration (one to two hours) missions that operate below the coordinating altitude and are thoroughly integrated with ground forces as an organic asset supporting tactical operations.
>
> **Brigade level: medium-range** (less than 125 kilometers), medium-duration (five to 10 hours) missions that integrate with ground forces and other aviation assets.
>
> **Division-level and higher:** extended range (200 kilometers or more), long duration (16 hours or more), missions in direct support (DS), or general support (GS) at the tactical or operational level.

1. Applied Missions

Army Doctrine Publication 1 states that "the Army's indispensable contributions to the joint force—the core competencies—are combined arms maneuver and wide area security."[95] These competencies are those in which UAS applied at the tactical level prove indispensable in today's combined arms warfare. While UAS can easily be employed throughout each of the Army's core competencies, the Army's Unmanned Roadmap report states the overall goal is to "focus Army investments in unmanned systems and technologies to meet the prioritized capability needs of the Warfighter that include the following missions": (1) Reconnaissance and Surveillance, (2) Security, (3) Attack, (4) Command, Control, and Communications Support, (5) Combat Support, and (6) Sustainment.[96] The roadmap further stresses the importance of UAS as the "Eyes of the Army" and that they specifically "support **tactical echelons** in Army and Joint operations and provide the Warfighter a tactical advantage through near real-time situational

[96] U.S. Army, *Unmanned Aircraft Systems Roadmap 2010–2035,* 3–4. Reconnaissance and surveillance include chemical biological, radiological, nuclear, and high-yield explosives reconnaissance and counter explosive hazards. Security includes preserving friendly force combat power and providing threat/terrain information. Attack includes close combat, interdiction attack, strike, and target identification and designation. Command, control, and communications (C3) support enables the commanders to broaden the communication network and improve C2. Combat support includes military intelligence, engineer, military police, chemical operations, and combat identification. Sustainment includes the delivery of supplies and materials to forward-deployed units and the extraction of wounded and enemy prisoners of war.

65 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

awareness, multi-role capabilities on demand … and the ability to dynamically retask."[97] The roadmap further defines eight significant "takeaway themes" of the UAS strategy. The following five are applicable to this discussion:[98]

Army UAS Roadmap Takeaway Themes

- The Army's UAS strategy provides dynamically retaskable assets to ground commanders.
- The Army's UAS provide actionable intelligence to the lowest tactical level.
- The Army's UAS strategy shortens the "sensor-to-shooter" timeline.
- The Army's UAS support full spectrum operations.
- Allow commanders to employ a variety of capabilities.

2. Employment Concept

Army UAS, similar to their Air Force counterparts, are also currently employed 24/7/365; however, the significant difference between the programs is that the Army does not currently employ an RSO model. For most of the Army UAS force, this lack of an RSO model is a technical limitation, which applies to all military small UAS, since current Group 1 UAS are not equipped with beyond-line-of-sight (BLOS) satellite capabilities. In the cases where the UAS are capable of BLOS, the Army units capitalize on this capability. However, unlike the Air Force, which operates from CONUS, Army units remain deployed forward so that they can remain organic to the unit, with the idea they can respond better to the commander's need to "dynamically retask" assets as the tactical situation dictates.[99] In addition, the Army's MQ-1C Gray Eagle has several technical differences from its Air Force counterpart, the MQ-1B Predator. The Army's MQ-1C is equipped with an automatic takeoff and landing system, thereby reducing the launch and recovery operator requirements across the force.[100] It is also controlled via "point-and-click" software, while

---

[97] Ibid., 1 (emphasis added).

[98] Ibid., 2 (emphasis added).

[99] Some of the systems that are capable of satellite BLOS operations often require some CONUS reach-back in terms of intelligence exploitation (e.g., video, signals, and so forth) because the deployed infra-structure is often unable to meet the volume of information collected.

[100] OSD Website, "MQ-1C Gray Eagle Unmanned Aircraft System," accessed September 10, 2014, http://www.dote.osd.mil/pub/reports/FY2010/pdf/army/2010mq1cgrayeagleuas.pdf.

66 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

the Air Force's MQ-1B retains a stick and throttle in addition to its autopilot "point-and-click" functionality.

3. Force Presentation Model: Uniformed Military

Within the Army, the size/echelon of the primary UAS unit providing support depends on which echelon it summarily supports. For example, Group 1 UAS are typically provided by a UA Team to support an associated Battalion (see Table 4). For Group 3, a UAS Company supports the Brigade. Finally, a UAS Company typically provides MQ-1C Gray Eagle (Group 4) support to the Division. Rotational forces are not built within each of these units since they are inherently designed to deploy in-mass with their Higher Headquarters (HHQ) to provide direct support to the same ground force commander with whom they train while in-garrison. Table 5 and Table 6 depict the *typical* force structure for each of these UAS units. In general, the UAS Team consists of 2 operators, the Platoon consist of 27 soldiers (see Table 5), and the Company has approximately 128 total personnel (see Table 6, includes maintenance).[101] As for combat capacity, the Army's UAS program calls for the following aircraft inventory per unit level (typical): Group 1 Teams: 3 aircraft, Group 3 Platoons: 4 aircraft, and Group 4 Companies: 10–12 aircraft each. Unlike the Air Force presentation model, which refers to number of CAPs provided, Army UAS units use their aircraft inventory in a manner directed by the commander and in response to the tactical situation at hand. Simply put, the number of flights launched is a balance between crew/aircraft availability and tactical mission requirements.

68 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

In terms of category of performers, the Army currently uses WOs and enlisted soldiers to operate their aircraft. Officer involvement comes with one officer position commanding the Group 4 UAS company[102] while UAS WOs command the Platoon. The Army does have a unique UAS military MOS for both WOs and enlisted soldiers, but does not have the same for the officers O-1 and above.

Although enlisted operators were used to operate the plethora of Groups 1–3 UA, much like the Air Force, the addition of Group 4 UAS capabilities and subsequent tactical capabilities drove the Army to integrate WOs and establish a unique Warrant UAS MOS. According to numbers within the Army's roadmap, WO positions still only comprise ~18% of the UAS Group 4 Companies and ~13% of the Group 3 Platoons. Except for the one Officer (Company Commander), all remaining operators in the units are enlisted soldiers.

4. Utilization of Contractors

The tactical forward-deployed nature of Army UAS tends to drive the requirement for uniformed military personnel. However, over the years, the Army, much like the other Services, has used contractors to provide UAS support and capability where there were associated capability gaps within the Army's programs. Similar to the Air Force, Army UAS contractors support functions such as maintenance and training. In addition, the constant increase in demand has also driven a requirement for MQ-1C GOCO operations.[103]

D. Navy

The Navy's UAS program[104] has focused on support to the Fleet and littoral regions. For this reason, the Navy invested early in Group 2 and has, within the past few years, added the Group 4, MQ-8 Fire Scout and the Group 5, MQ-4 Triton. With a long history of unmanned aviation development, Navy UAS efforts are rather diverse, focusing on the next-generation Unmanned Combat Air System (UCAS), designed to prove an autonomous capability to launch from an Aircraft Carrier, to a variety of rotary wing UAS, designed to deliver supplies to deployed forces with little more than 5 minutes of operator training and a mobile tablet device.[105]

69 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

1. Applied Missions

With the combined effects of the surface fleet and Naval Aviation, Navy UAS can span from tactically focused missions to the strategic. The missions associated with these levels of warfare currently trend down the same lines associated with the UAS "Groups." For example the Navy's Group 2 ScanEagle maintains an extremely unit-level tactical focus, whereas the MQ-4C is used in a more regional/strategic role akin to its Air Force counterpart, the RQ-4. The Navy, similar to the other Services, applies UAS capabilities across each of its designated mission sets:

ASUW – Anti-Surface Warfare
ASW – Anti-Submarine Warfare
BAMS – Broad Area Maritime Surveillance
BDA – Battle Damage Assessment
C3 – Command, Control, and Communications
EOD – Explosive Ordnance Disposal
EW – Electronic Warfare
FP– Force Protection
ISR – Intelligence Surveillance, and Reconnaissance
LG – Logistics (Cargo Resupply)
MDA – Maritime Domain Awareness
MIW – Mine Warfare
OMCM – Organic Mine Counter Measures
RSTA – Reconnaissance, Surveillance, and Target Acquisition
STRIKE – Precision Strike

2. Employment Concept

The Navy, similar to the other Services, currently employs Groups 1–3 UAS via line-of-sight (LOS) control with forward-deployed forces directly supporting the surface fleet commander or associated ground force commander (mission dependent). Currently, the smaller Group 2/3 aircraft are primarily flown in support of the Naval Special Warfare Command (NAVSPECWARCOM), while the larger Group 4/5 aircraft are flown in direct support of fleet operations.[106] Many of these UAS are operated directly off of the surface fleet ships where UAS crews conduct both launch and recovery and mission operations. In contrast the larger Group 5, MQ-4C Triton uses a RSO model similar to that of the Air

2425c045167a/Reinventing-the-Drone,-Reinventing-the-Navy--1919-.aspx; "Navy to Fly Drone Helicopters from Tablet App," *RT*, April 7, 2014, http://rt.com/usa/navy-aacus-helicopter-drone-941/).

[106] Interview with Navy UAS program staffers, January 9, 2015.

70 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

Force, with forward-deployed launch and recovery bases supplying aircraft for CONUS-based units to conduct operations.

3. Force Presentation Model: Uniformed Military

For Group 1 aircraft, the Navy operates in a similar way to that of the Air Force and Army, with individuals trained as an additional duty, operating in 1- and 2-man teams. These teams are typically security or Sea, Air, Land (SEAL) teams supporting their associated tactical element. For Group 2/3 aircraft, the Navy has relied primarily on contracted services, or in some cases individual augmentees from within the Service to perform duties while deployed.[107] For Group 4/5 aircraft, the Navy has adopted the Squadron as the primary force provider for UAS capabilities.

The Navy's rationale for using previously rated aircrew for Group 4/5 UAS is that it requires less training and that associated operating risk is reduced based upon their existing knowledge of aviation fundamentals and mission execution. In short, the Navy contends that it is less costly and presents less risk to use previously rated individuals. While the Navy has adopted the squadron model for its larger UAS, some unique characteristics are associated with its programs. For the Group 4 MQ-8B Fire Scout, the squadron is actually a helicopter squadron containing manned and unmanned aircraft. The operating concept for these squadrons is that naval aviators assigned to operate manned helicopters operate the unmanned helicopters as an additional duty. According to Navy personnel, the largest driver for this concept is bed space available on the ship.[108] Limited space equates to limiting resources, so the combination of crews flying similar missions, albeit with different platforms, makes logistical sense.

The Navy had a similar mindset when establishing its unmanned patrol squadrons (VUPs) operating the Group 5 MQ-4 Triton. However, rather than dual-qualifying their crews, pilots assigned to the VUP are solely focused on Triton operations during their assignment. The Navy does not take any new accessions into the program but rather sources it from other patrol squadrons (VP) flying similar missions in aircraft such as the P-8 Poseidon. Since all Group 4/5 UAS Naval Aviators come from a previous manned flying background, they all maintain a minimum of a BUQ-V/JMQ-B joint training level.

As discussed in Chapter 2, the Navy gave consideration to a flying WO program; however, after 6 years, this program was terminated in 2013 when it was deemed

---

[107] Interview with Navy UAS program staffers, January 9, 2015. IAs come from within the Navy uniformed Service members (Officers) and are provided the training necessary to perform duties while on a particular deployment or sea rotation. These "particular duties" are not their primary duties, and, upon completion of their rotation, they return to their normal specialty. They currently represent approximately 10% of the force used.

[108] Interview with Navy UAS program staffers, January 9, 2015.

71 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

counterproductive to career progression goals of standing Navy programs.[109] In addition, while the Navy does have the LDO program, it does not currently include opportunities for naval aviators.[110]

4. Utilization of Contractors

As mentioned previously, the Navy has used service contracts for over a decade to obtain ISR capabilities using UAS such as the Group 2 ScanEagle. The contractor provided teams of four operators with unmanned aerial vehicles (UAVs), sensors, ancillary equipment, and support services. The teams were stationed on Navy ships and in combat zones on land. The use of service contracts was justified originally as necessary to meet an urgent operational need. From an operational standpoint, the results were reported as positive. Currently, the Navy is undergoing efforts to establish an in-house military infrastructure to operate and sustain the Group 3 RQ-21 Blackjack and to replace the primarily contracted Group 2 ScanEagle.

E. Marine Corps

Focused on the tactical employment of the Marine Air Ground Task Force (MAGTF), the Marine's UAS program consists primarily of Group 3 and smaller UA. Much like the Army, these systems are focused on tactical-level employment and direct integration with the supported ground force. Although the Marine UAS program is applied in a similar fashion to its ground counterpart in the Army, the programs have some differences in organizational structure. The Marine UAS program strives to ensure direct tactical support to the MAGTF while also ensuring complete integration with the larger joint force. Also, while the Marine UAS echelons depicted below describe the currently executed UAS program, the Marine Corps is looking at the maturation of Group 3 UAS to perform the missions/roles currently supported by the larger Group 4/5 aircraft. This effort shapes much of the way the Marines have staffed their UAS program.[111]

72 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

Typical Marine UAS Echelons

Battalion-level and lower: Group 1
Regiment level: Group 2/3
Brigade/Joint Task Force: Group 4/5 (none currently in inventory)

1. Applied Missions

The roles of Marine UAS are not that different from the other Services' programs. Marine aviation doctrine summarizes UAS tasks as conducting ISR, target acquisition, and airborne surveillance for search and rescue and tactical recovery of aircraft and personnel; supporting vertical assaults (helicopter/tiltrotor); adjusting direct/indirect fire; and conducting battlefield damage assessments (BDAs).[112] The more recently published Marines UAS doctrine mirrors these tasks but also includes rear area security, training, and the ability to "provide a remote-receive station capability and liaison to designated units" (i.e., expand C2 communications).[113]

2. Employment Concept

Due to the tactical-level focus of the Marine UAS program, it is employed similarly to that of the Army—UAS pilots and operators deploy with and remain integrated with the overall MAGTF that they support. Like the Army concept, the goal is for the UAS operators to deploy with their home-station unit, thereby training in-garrison with those they will directly support during their deployment. All current UAS employed by the Marines are controlled via LOS communications; however, they are pursuing a BLOS capability for their Group 3 UAS.

3. Force Presentation Model: Uniformed Military

Group 1 UA are employed using the same two-man team concept as the other Services. Although trained to the joint standard, the Marines also view this two-man team concept as an additional duty and do not assign a special MOS for these smaller UA. However for Group 2 and Group 3, the Marines are organized into Marine unmanned air-

craft squadrons (VMUs) assigned under the Marine aircraft wing of a Marine Expeditionary Force (MEF). The VMUs are organized into self-sufficient detachments that include intelligence, support personnel, enlisted UAS operators, and officer UAS aircraft/mission commanders. These detachments are designed to be assigned to the combat aviation element of an MEU or larger MAGTF. The VMUs currently operate Group 3 RQ-7B Shadows and have begun receiving the RQ-21A Blackjack. They are organized as depicted in Table 7.

Table 7. VMU Table of Organization

Source: MGySgt Donald D. Phillips, Washington DC: Headquarters Marine Corps, March 4, 2014.
Note 1: This column is the sum of the total columns under officers and enlisted.
Note 2: This row is the sum of the rows above it.

Much like the Army, when the VMU launches its aircraft, it balances the combat requirements with aircraft/crew availability. While each of the Shadow detachments are currently responsible for operating a single UA at a time, the larger Group 3 detachment is suborganized into three sections, each of which is responsible for a single UA operation. All of the detachments have a mix of operators, intelligence personnel, and support personnel, so these detachments can be somewhat self-sufficient when task organized into MAGTFs. The Marines do also have a reserve component VMU, which maintains a similar force structure.[114]

Marine UAS were initially operated primarily by enlisted personnel and supervised by commissioned Marine aviators; however, as the demand and associated role of the UAS expanded across the MAGTF, it was decided to employ more officers in the leadership. Combat lessons learned continued to mature the Marine concept of UAS operations as a permanently established career field. A Marine lessons learned report covering

Afghanistan UAS operations[115] cited the lack of a UAS-specific MOS as degrading the community's capability to retain experience and corporate knowledge because augmentees from the manned aviation community departed after approximately a year and a half without returning to the UAS community for follow on assignments.

To address this challenge, the Marines, much like the Air Force, have since developed a specific UAS aircraft commander MOS. As the most recent FY15 UAS officer accession board announcement states, this effort is in line with "the larger UAS manpower strategy, focused on establishing a professional cadre of UAS officers."[116] Officers selected for this role actually attend the Air Force's Undergraduate RPA Training in Texas alongside their Air Force counterparts and then complete RQ-7 Shadow training from the Army training program.[117] The enlisted operators also attend the Army training program and initially are qualified as the air vehicle operator (AVO) (i.e., pilot). As their experience grows, they are further certified as mission payload operator (MPO) (equivalent to Air Force sensor operator).[118]

While enlisted operators are used to physically control Groups 1–3 UAS, officers fill the role of aircraft commander by planning and directing the mission, coordinating airspace, ensuring the integration with other airborne assets, and so forth.[119] Officers are initially qualified as an aircraft commander over a single mission, but, as their experience and capability increase, they are upgraded and certified as a mission commander with the ability to command several UA missions at once (all physically piloted by enlisted operators).[120] Since these UAS officers are graduates from the Air Force's Undergraduate RPA training course, they are all BUQ-IV qualified in accordance with CJCSI 3255.1. As the Marine Corps either matures its Group 3 capability into missions currently reserved for Group 4/5 (i.e., kinetic operations, strategic ISR, and so forth) and/or it acquires true Group 4 capability, these UAS officers will not only have prior experience, but will already be trained and qualified at the appropriate level to meet Chairman of the Joint Chiefs of Staff

(CJCS) and FAA requirements. The importance of this career field is highlighted by the recent United States Marine Corps (USMC) Deputy Commandant for Aviation decision to capitalize on the EA-6B community by transitioning EW officers into this new UAS Officer MOS as the program moves toward its Fiscal Year (FY) 2020 sunset.[121]

F. Special Operations Command

With a wide range of global operations, the Special Operations Command (SOCOM) operates the widest diversity of UAS. Although SOCOM executes Service-like functions, much of its equipment and capability comes from that already inherent within DoD. As such, SOCOM UAS units are staffed in manner similar to those described previously. Although Group 1 is conducted by operators trained as an additional duty and Group 2/3 are primarily contract support (initial Navy model), SOCOM does have dedicated UAS organizations in both the 160th Special Operations Aviation Regiment (Army) and 27th Special Operations Wing (Air Force). All of these units are staffed in a manner similar to their general-purpose force counterparts. SOCOM also uses the previously mentioned GOCO UAS to support its operations. This support includes everything from the Group 2 ScanEagle to the Army's Group 4 MQ-1C Gray Eagle and Air Force's Group 5 MQ-9 Reaper.

G. Summary

Based upon the review of individual Services, it is revealed that for the majority of the UAS Groups, the Services staff their programs with similar categories of performers but with some notable differences. Table 8 provides an overview of category of performers for the pilots/air vehicle operators of each group. One notable difference is reliance of the Army on WOs to provide leadership within their Group 3/4 UAS units, whereas the other Services rely on officers above the rank of O-1.

Note: This table summarizes the primary focus of those used to control the aircraft. The Air Force and Navy have approximately one-half their Group 4/5 UAS force as enlisted sensor operators.

The other major difference between Services is that while the Air Force and Marines have a dedicated Officer corps for UAS, the Navy and Army do not. The Navy relies on the use of previously qualified pilots from similarly tasked aircraft, while the Army relies on its WOs as previously discussed. Table 9., Table 10., Table 11., Table 12., and Table 13. summarize each of the Services by UAS Group.

5. Service Staffing Business Rules

As seen in the last chapter, each military Service applies a unique "lens" to evaluating its individual requirements. While this approach is anticipated and arguably necessary for a functionally defined military Service, these programs shows some basic commonality that does not necessarily arise from the earlier reviewed statutory guidance. These common practices, referred to from here on as "business rules," are built upon lessons learned, best practices, and, in some cases, the application of commonly accepted cultural perceptions, which shape how and why programs are designed and the manner in which they operate. In other cases, the Services vary vastly between how they present UAS forces. In some cases, the following business rules may seem rudimentary and already addressed in the statutory guidance; however, this analysis aims at capturing commonalities that apply universally to the Services, not Service-unique characteristics described in the previous chapter. This paper does not endorse any of these particular business rules, but rather outlines which business rules are currently in place and provides discussion on any potential implications.

A. Military Incumbency

Statutory guidelines clearly state that the determination of an IG function requires a thorough analysis of the mission and associated risk. If the member is expected to raise arms against an enemy force as part of his/her role, then military incumbency is required.[122] Using this thought process, members assigned to Army maneuver units must be military members since they are expected to move and fire along with the organic force they support. By applying the Marines ethos of "every Marine is a Rifleman," one can also see where the Marines drive military incumbency by the very expeditionary nature of their Service. One can even make a case that the Air Force applies this business rule to the preponderance of their forward-deployed launch and recovery elements (LREs). At a minimum, this concept is applied to the Air Force SOCOM alert-capable launch and recovery force, which requires military personnel to meet the potential instantaneous deployment and subsequent movements required by the nature of their operation.[123]

With this in mind, the first business rule common across all Services is as follows:

[122] This rule does not include self-defense situations.

[123] Input from AFSOC/A5K subject matter experts (SMEs) during RPA Manpower Working Group meeting January 7, 2015.

82 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

UAS operators assigned to a combat maneuver unit must be uniformed military personnel.

While this rule holds true for smaller UAS operators, a counterpoint is possible to this rule because most of today's larger UAS operations occur within the confines of a secure location. This argument contends that because UAS tend to operate from secure forward-operating bases, it is the unit they support that maneuvers throughout the battlespace, not the UAS operators. The larger UAS systems inherently require increased infrastructure, and, therefore, their associated mobility decreases incrementally with the size of the operation. While this situation holds true for current operations, this business rule is still applicable based upon programming for a force that meets the missions tasked to a particular unit, not necessarily the missions or operating environment in which the unit currently finds itself. As discussed later in this chapter, technology maturation may also affect how systems are employed, which would further enable UAS operators to embed with their associated supported units if so desired.

B. Civilians

While research noted several cases in which DoD employed either GOCO or contractor-owned, contractor-operated (COCO) service contracts for UAS operations, at no point did the team come across an incident in which a DoD civilian piloted and/or operated full-motion video sensors for a UAS program leading us to the first observation:

DoD civilians are not used to operate UAS.

While DoD civilians are sometimes heavily involved in support functions (i.e., as full-motion video analysts), they are not involved in physical control of the aircraft. While it appears that the Services have applied the "military incumbency" rule to their own UAS programs, the utilization of contractors across the DoD UAS enterprise implies a comfort level allowing civilians to operate these systems; therefore, this paper will not discount the use of DoD civilians in the analysis of alternatives that follows.

C. International Airspace

Applied primarily to the larger Group 4/5 UAS, each Service uses officers to control operations within international airspace. Although not specifically dictated, the Services appear to have determined that the scope of responsibility associated with the remote integration of an aircraft within the international civilian airspace infrastructure aligns with the additional level of responsibility inherent within the officer corps.

83 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

"Officer equivalents" are required for UAS operations within international airspace.

Although this rule applies across all Services, the focus on the level of resources applied to a specific UAS Officer corps by a Service does reflect its overall mission focus. As outlined in Chapter 4, the Air Force is responsible for responding globally and must have pilots who can operate within all environments, regardless of airspace structure. As such, their entire Group 4/5 pilot force is comprised of officers (greater than or equal to the rank of O-1). The Navy's sea-basing construct and support to the fleet has a similar requirement, thereby similarly shaping its force. While the largest UAS for the Marines is a Group 3, it is expeditionary in nature and must be prepared to operate within locations before a formal military restricted airspace structure has been established. In contrast, while the Army does indeed use WOs for its Group 4 UAS, its UAS program is focused on support to larger general-purpose forces that tend to establish operations after such airspace infrastructures are in place, thereby not requiring the extensive level of officer participation inherent in the other programs.

The term "officer equivalent" is used for this business rule because there are examples of contracted UAS programs that operate within international airspace and have no restrictions on DoD civilians doing the same. In many ways, this situation is similar to those major civil airlines that require pilots to have a bachelor's degree even though this level of education is not an overall FAA/IACAO requirement. The "officer equivalent" term is used to illustrate the level of responsibility with this position.

As a final note, although this business rule appears to apply only to the larger UAS, as technology and capabilities mature, it will also become applicable to smaller UAS.

84 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

D. Sensor/Mission Payload Operator

A commonality across each of the Services is the use of enlisted members as sensor operators. Much like the "officer equivalent" term used previously, enlisted equivalency is phrased to incorporate the level of authority and responsibility applied across both military and contract applications.

UAS sensor/mission payload operator positions are sourced solely with "enlisted equivalents."

E. Precision-Guided Munitions (PGMs)

While military members of all ranks within each of the Services may be called upon to raise arms in support of our nation's defense, the Services have demonstrated that the application of PGMs in warfare brings a responsibility commensurate with the leadership and authority our nation entrusts to our commissioned military officers:

Military officers are required for release authority of PGMs.

As described in 2005 by Professor Michael Schmitt from the George C Marshall European Center for Security Studies, the application of PGMs during Operation Iraqi Freedom demonstrated that the interpretation of international humanitarian law is increasingly complicated for those employing such munitions.[124] Schmitt tells that great care was taken in conducting collateral damage assessments and that if estimates for civilian casualties were projected to increase over a certain threshold, the mission needed Secretary-of-Defense approval.[125] As Schmitt contends, "While there is no legal requirement for higher-level approval as collateral damage or incidental injury grows, the United States recognized that American precision capabilities meant it would be judged harshly for causing harm to civilians and their property."[126] Such an example illustrates the need for the authority which resides within the officer corps.

---

124 Michael N. Schmitt, "Precision Attack and International Humanitarian Law," *International Review of the Red Cross* 87, no. 859 (September 2005): 445–466, https://www.icrc.org/eng/assets/files/other/irrc_859_schmitt.pdf.

125 Ibid., 457–458.

126 Ibid., 458.

85 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

While this business rule associated with PGM release authority applies across all Services (and beyond employment of UAS), the Services, as is typical, take independent approaches. For the Army, who views its UAS as an integrated weapon within its maneuver force, PGM release authority is applied through the ground force commander, and that authority is employed under the leadership provided by commissioned WOs within the larger UAS program. Although the Marines' organic UAS do not currently employ a PGM weapons capability, its force structure is designed to accommodate such operations with a dedicated UAS officer corps operating as mission commanders over their operations. For the Air Force, which operates most of the PGM-capable UA, release authority may not always come from a ground force commander. For example, a strike coordination and reconnaissance mission may have a list of nominated targets that will require the aircraft commander to make the final targeting and release authority determination. Senior leaders within the Air Force RPA community contend that for cases in which the pilot is responsible for interpreting the commander's intent, it is necessary to balance the tactical objectives against strategic implications rather than simply follow orders to employ. The Air Force contends for its assigned missions that this decision increases the level of responsibility commensurate with that of an officer.

F. High Cost/Demand, Low Density Assets

Throughout research for this topic, several individuals raised the issue that the cost of larger Group 4/5 UAS drive the requirement for officers as pilots. While this paper found no direct linkage to statutory guidance directing such a requirement, the application of manpower to aircraft does support this conclusion and has thus been included as a current business rule:

Cost of airframes and the high-demand, low-density (HD/LD) nature of large UAS compel the use of officer pilots.

The larger UA, although often thought of—and in some mediums referred to—as disposable are anything but. Pairing the costs of the aircraft and associated systems with the ongoing insatiable demand for their support classify these aircraft as extremely valuable, HD/LD assets. In many cases, in the event of a UA crash, combat rescue teams have been deployed to recover components from the crash site.[127] Such incidents seem counter-intuitive since this deployment if rescue teams places humans at risk within a combat zone to recover parts from an uninhabited system.

[127] Research Team members' personal experiences.

86 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

For an order of magnitude on associated costs, estimate places the RQ-4 Global Hawk around $120 million. Thus, it is easy to understand that the responsibility for operating such a platform should be akin to the authorities and accountabilities associated with a military officer. However, the counterpoint to this business rule seeks the answer to an important question: what exactly is the cut-off value for such a determination? The Air Force's MQ-9 is valued at approximately $12.5 million, and the MQ-1B is valued at approximately $4.5 million. As discussed previously, the Air Force operates both UA with officer pilots, yet the Army's similar MQ-1C program includes enlisted pilots.[128] For a comparison to another weapons system, one estimate places the cost of the Army's Abrams tank at $7.5 million. The Abrams tank is operated by enlisted and junior officers. Another dynamic associated with this discussion comes in light of the HD/LD nature of these assets. While the MQ-1B Predator is not "expensive" (in terms of major military weapons systems), the fact that it is no longer being produced drives a limited supply of resources among a continuing increase in requirements, thereby playing a role in this business rule of high-cost HD/LD assets requiring the level of accountability inherent within a military officer.

G. Summary

In looking at the commonalities between the Services, the six business rules in Table 14 appear universally across the Services and are platform agnostic. Having defined the commonalities and associated business rules currently in place, analysis will now turn toward the discrepancies within the Service's workforce mix strategies.

Table 14. Business Rules for UAS Staffing

1	UAS operators assigned to a combat maneuver unit must be uniformed military personnel.
2	DoD civilians are not used to operate UAS.
3	"Officer equivalents'" are required for UAS operations within international airspace.
4	UAS sensor/mission payload operator positions are sourced solely with "enlisted equivalents."
5	Military officers are required for release authority of PGMs.
6	Cost of airframes and HD/LD nature of large UAS compel the use of officer pilots.

[128] Army enlisted UA pilots are referred to as air vehicle operators.

87 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

6. Additional Observations of Service Staffing Practices

While the business rules define the common practices across UAS programs, Table 9., Table 10., Table 11., Table 12., and Table 13. (see Chapter 4) demonstrated significant differences in terms of category of performer determination. The following analysis provides a view into why these differences exist. Once again, rather than endorsing any of the Service's particular approach, this chapter outlines the differences and provides observations that could affect future workforce staffing decisions.

A. Officer vs. Enlisted Pilot Decision Process

The most commonly debated and discussed staffing decision within DoD's UAS enterprise is the difference between the Army's use of enlisted pilots and the Air Force's use of officer pilots for Group 4 UAS.[129] As seen in Chapter 4, and once again in

Table 15., the majority of the UAS enterprise is staffed similarly, with the Group 4 officer/enlisted paradigm being the major difference. Rather than skirting the obvious, the following subsections analyze elements of this decision process to describe the related rationale and to provide context and/or possible areas for alternate strategies in the future.

1. Cultural Impacts: Air Force

During research, some raised the point that a cultural aspect was behind the Services' category of performer selection, primarily the officer vs. enlisted decision. The Air Force is focused on the command and execution of air combat and is responsible for most of the larger UA within DoD. As described in Chapter 4, the Air Force contends that its global mission and decentralized execution model require a pilot who has the decision-making authority inherent of an officer. This belief is deep-seated within Air Force culture and can be traced back to the Air Corps act of 1926, which legislated that "at least 90 per centum of the officers in each grade below that of brigadier general shall be flying officers."[130]

---

129 Although the Navy's Group 4 UAS helicopters play a much smaller role, they are often left out of this discussion even though officers are also used in this role.

130 Air Corps Act of 1926, § 721, 69th Congress, accessed on September 8, 2014, http://legisworks.org/congress/69/publaw-446.pdf. The same legislation also directed that "in a time of peace, not less than 20 per centum of the total number of pilots employed in tactical units of the Air Corps shall be enlisted men." Although the Air Force did indeed have enlisted aviators, in May 1957, the last enlisted aviator, MSgt George Holmes, retired.

The Air Corps Act was designed to transition the Army Air Service into a more independent branch to strengthen "the conception of military aviation as an offensive, striking arm rather than an auxiliary service."[131] From this ingrained culture of "air mindedness," the Air Force aims to develop senior leaders who are focused on the employment and empowerment of airpower. Ensuring that the leadership pool is focused on aviation, current regulations mimic the days of the Airpower Act by directing "only Line of the Air Force crewmembers occupying active flying positions can command flying organizations."[132] This concept applies directly to the Air Force RPA officers in way that is similar to that of mobility and/or fighter pilots. To develop senior leaders who have

It is within this legislation that is was first decried that "Flying units shall in all cases be commanded by flying officers."

132 Department of the Air Force, "Appointment to and Assumption of Command," AFI 51-604 (Washington, DC: Secretary of the Air Force, 4 April 2006), 7, http://static.e-publishing.af.mil/production/1/af_a3_5/publication/afi51-604/afi51-604.pdf. In terms of regulatory guidance, Air Force Instruction (AFI) 11-401, "Aviation Management," and AFI 11-402, "Aviation and Parachutist Service," Aeronautical Ratings and Aviation Badges, make references and list requirements for the rated commissioned officer force. While one paragraph (2.2.1) in AFI 11-402 references a Title 10 authority dictating that "the USAF may award aeronautical ratings to USAF commissioned officers only," this Title 10 reference (Title 10 U.S.C. § 8691 actually states that "Only officers of the Air Force in the following categories may be rated as flying officers." Title 10 U.S.C. § 8691 then lists those who have and/or are receiving some level of flight-related training.

89 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

extensive knowledge and experience employing RPA, those officers must not only execute such operations as a young officer, but also develop throughout their career to appreciate the operational and strategic leadership required to ensure appropriate application of RPA within the nation's application of airpower.

The Air Force also contends that the foundational airpower model of "centralized control, decentralized execution" drives decision-making authority for individual missions into the hands of front-line pilots and therefore is reliant on officers (more on this in subsequent sections). This point was articulated in a 2010 Air Force report on a similar topic, where the author uses the charts in Figure 4a and Figure 4b to depict the difference between Air Force (blue) and Army (green) UAS operating concepts.

Recently, an Air Force RPA working group updated Figure 4 and delineated between the complexity of a system and the responsibility required to operate the system. Through discussions with the working group, this update was an attempt to show that it is possible to spend time and money to train individuals to an appropriate level for execution (pilot vs. operator). However, this particular working group contended that the true determinant in selecting an officer lies in the scope of responsibility required by the pilot (in the working group's case, an officer when talking decentralized execution). Figure 5 depicts the updated chart.

2. Cultural Impacts: Army

The Army's cultural history with enlisted aviators is also traced to the Air Corps Act of 1926, however the Army took a substantially different path than the AF by focusing on enlisted aviators. While the Air Corps Act directed a heavy officer force for the AF, it also directed that "in a time of peace, not less than 20 per centum of the total number of pilots employed in tactical units of the Air Corps shall be enlisted men …."[133] This practice was eventually ended by a War Department order that mandated that all prior enlisted aviators would to be promoted to second lieutenants by 17 November 1942.[134] The introduction of the helicopter into the Army once again drove a dramatic increase in the number of pilots required; however, the congressionally imposed officer force level prevented this expansion.[135]

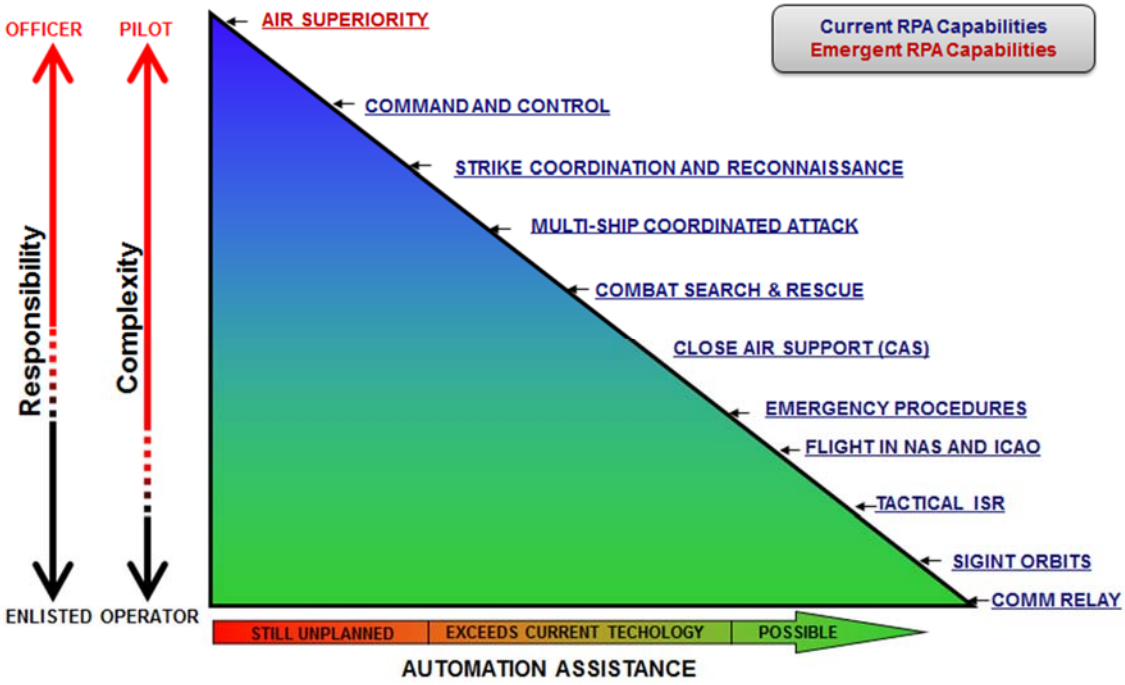

Figure 5. Air Force RPA Working Group Aircraft Capability Envelope (2015)

The solution was WO pilots, whose separate MOS was subsequently approved in 1949. Although the program has evolved in many ways, the Aviation Warrant Officer continues to form the backbone of Army aviation.[136]

An additional cultural perspective is observed in how the Army views the aircraft and crews themselves. As alluded to previously, the tactical nature of the Army's application lends itself to crews being used by Commanders in a similar fashion as their other organic maneuver and fires assets (simply another "tool in the toolbox"). In this role, they are directed where to be and what to do by superiors. This approach is in contrast to the decentralized execution method of the Air Force, where RPA pilots are tasked to support potentially several units during the length of the sortie and are responsible for deciding how to best deliver the desired effects rather than being instructed on what exact steps to take. Thus, where the Air Force extends its pride of pilot's aviation culture/mindset to the RPA community, the Army views the UAS crews as "operators" not pilots (hence, their MOS duty title of Unmanned Aircraft System Operator). Although the Army UAS crews are awarded "wings," this cultural perspective was highlighted at the inaugural ceremony at which aviation badges were awarded to UAS crews by the then-UAS training Battalion

---

[136] The Army conducted an Enlisted Aviator Study in 1986. This study determined that creating an enlisted aviator was possible but would not be desirable because the leadership role of the WO would be lost (see Warrant Officer Historical Foundation Website, "History of the Army Aviation Warrant Officer," accessed September 10, 2014, https://warrantofficerhistory.org/Hist_Avn_WO.htm). The 1986 study is available within the Pentagon's library. Location information is provided at http://www.worldcat.org/title/1986-enlisted-aviator-study/oclc/17943829.

92 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

Operations Officer, Captain Kyle Duncan, who stated, "They deserve this recognition. They are not pilots, but they are operating in theater, in aviation, and they're working with rotary aircraft, fixed wing aircraft, with naval, Marine and Army Aviation. They are not getting an aviator's badge; they are getting an aviation badge. We recognize them for their work, as part of aviation."[137]

Based on the analysis of these two individual Service cultures, it is apparent that

Service culture shapes how the roles and responsibilities are viewed for individual category of performers.

3. Visualization Model

In the decision tree introduced in Chapter 2, when determining which category of performer to use, the model depicted stopped simply at "Uniformed Military." Obviously, this decision matrix continues on to include officer and enlisted, along with the previously mentioned officer subsets, as shown in Figure 6.

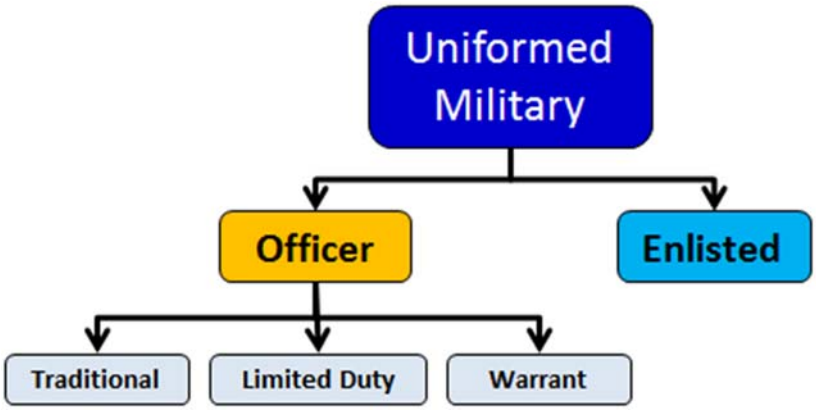

Figure 6. Uniformed Military Category of Performers

93 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

In reviewing the business rules and observations addressed in Chapter 5, it is apparent that the Services' staffing methodologies are driven more by the scope of mission tasked than by the physical characteristics of the aircraft being flown. While this approach is hardly a revelation for those familiar with military history, it is important to highlight this context when looking at staffing methodologies—specifically, when assessing the often emotional discussion over the use of officer vs. enlisted in UAS operations. While the previous Air Force figures attempted to show this complexity, analysis proves that the model is too simplistic. As the updated RPA working group figure (see Figure 5) shows, one can train to any level, but the aspect of "responsibility" plays a significant role in whether an officer is required. When looking at this issue from a non-Air Force perspective, when an officer's authority is required, it is injected appropriately. For the Army, this authority comes in the form of centralized execution and tasking, and, for the Marine Corps, it comes from the Mission Commander. The difference between the three Services in this case is frequency of need, operating environment, and delegation of risk assumption.

As alluded to previously, complexity also plays a role in determining staffing—whether it is the complexity of the system or the complexity of the operations involved. In simple terms, the more complex it is to operate an aircraft, the more likely it is to require an "officer equivalent" to pilot.[138] This same relationship is seen within the civil sector, where international commercial airlines require a bachelor's degree and continuing education for their pilots, while general aviation enthusiasts and some regional carriers do not require a degree to fly simpler aircraft within less congested airspace. When combining these concepts with those discussed in the mission element, business rule, and observation analyses, one can distill the officer vs. enlisted staffing methodology into three major aspects: (1) system complexity, (2) risk assumed, and (3) operational environment.

Figure 7 illustrates the relationship between these events while also showing some of the attributes associated with each axis. This characterization helps to put the analysis of current Service practices and business rules into context and shows how

DoD-assigned missions/responsibilities and the anticipated operating environment shape how the Services view the role of their UAS.

[138] This statement does not imply that enlisted are incapable of working complex systems. It is simply an acknowledgement that the officer corps is more likely to be vetted and trained to include individuals who are capable of the increased complex problem-solving skills associated with analytical thinking.

94 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

To illustrate this point, we will review two examples: (1) the relationship between the Air Force and Army's MQ-1 programs and (2) the Marine Corps' Group 2/3 staffing methodology.

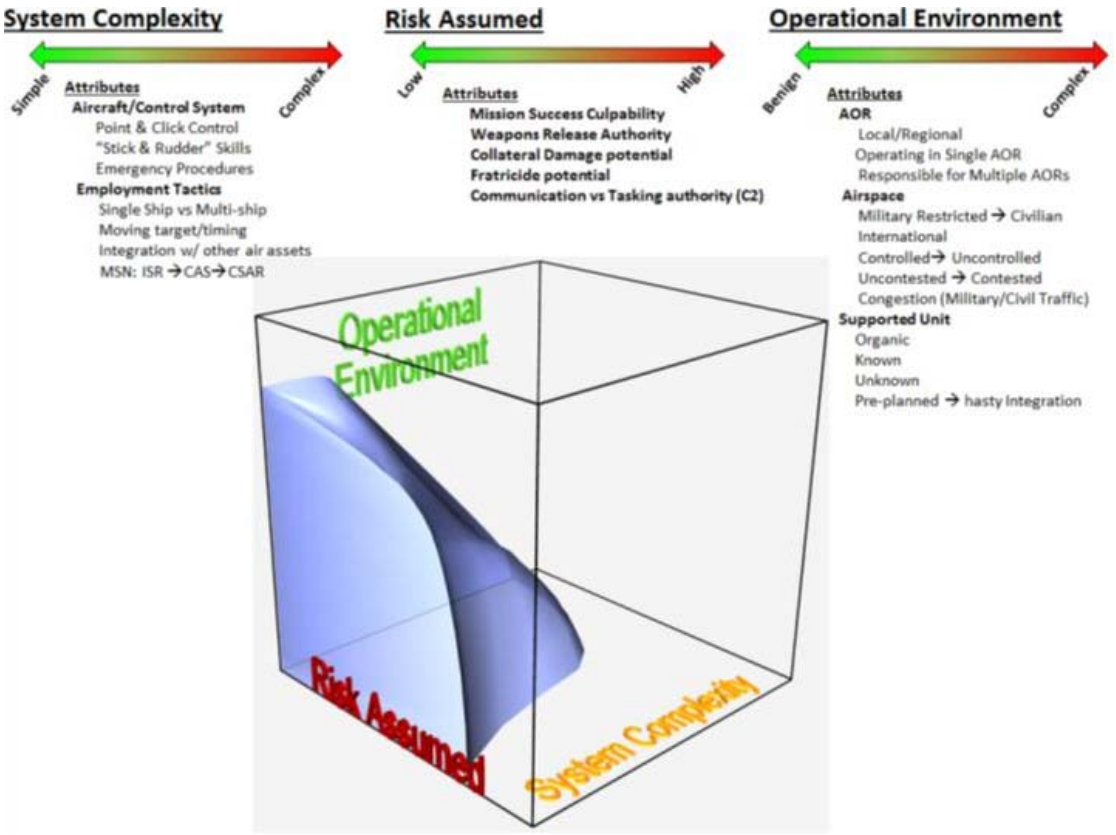

Figure 7. Complexity, Risk, and Environment Relationship

In the first example, the Air Force and Army operate MQ-1 variants yet have different staffing methodologies. The Air Force contends that an officer is required because of the associated mission risk and operational environment, which includes elements such as international/uncontrolled airspace and weapons employment. In addition to these risk factors, although the MQ-1B has basic autopilot features, complexities still exist with this relatively early generation UAS. As shown in Figure 8, this situation places MQ-1 B operations within the region that warrants the use of an officer when aircraft control complexities are combined with the level of risk assumed. In contrast, in the Army's view, its tactically focused, lower risk, regionally isolated operations with centralized control and execution are consistent with the reliance on enlisted operators led primarily by WOs. In addition, the newer MQ-1C variant provides increased autonomy associated with aircraft control (point and click vs. stick and throttle). As seen in Figure 8, this combination of mitigating risk through the combination of technology, operating environment, and operating concept enable an enlisted force structure supporting the Army's MQ-1C operations.

95 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

In the second example, the Marine Corps has used a similar combination of technology, operating environment, and concept of operations (CONOPS) to mitigate risk and reduce its manpower costs. As discussed previously, the Marine UAS program is designed to support the expeditionary nature of the MAGTF.

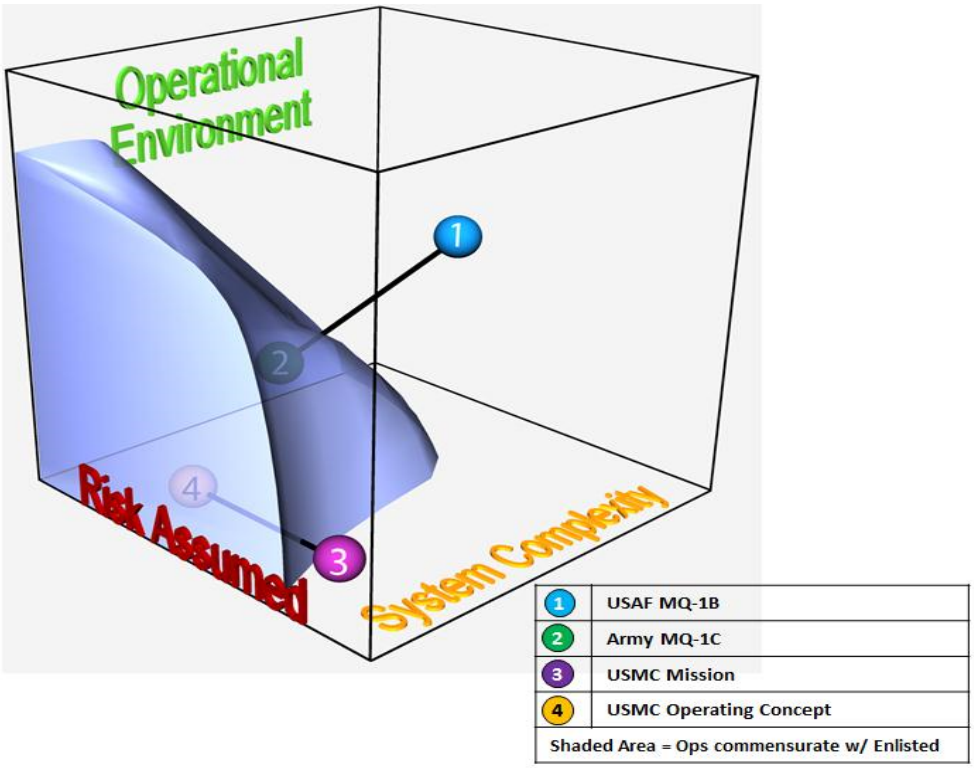

Figure 8. Illustrative Examples: Complexity vs. Risk

Therefore, the program must be able to respond in highly complex operating environments and with little notice, thereby increasing the mission risk to arguably high levels (depicted as "USMC Mission" in Figure 8). The Marine Corps program addressed these issues through a combination of technology and CONOPS. All of the current Marine UAS are relatively simple to operate and do not require an understanding of complex aeronautical concepts to operate or extensive problem solving to address failures. This fact alone makes the operation of the Marine UAS program much like the Army SUAS program, which uses enlisted operators in medium-to-low risk missions. However, as discussed, the anticipated operating environment increases the mission risk of the Marine UAS program. By creating a UAS-specific officer MOS and placing these officers in mission commander roles over the enlisted operators, the Marines feel that they are able to mitigate risk to a level acceptable for enlisted pilots. While the pilots handle the relatively simple task of aircraft control, the officer is responsible for airspace coordination and integration with the overall battle scheme of maneuver. The Marines built their program upon this risk-mitigating operating concept to ensure that the program was unbound by aircraft. While current

96 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

Marine platforms are easy to operate, the Marine force presentation model is designed to support developments similar to those found currently in Group 4 UA, such as long endurance, BLOS control, and weapons employment.[139] As long as the complexity of control remains manageable (i.e., simple), the UAS officer mission commander is responsible for mitigating risk to acceptable levels. In cases where the risk may prove to high (e.g., complex weapons employment in urban scenario), the Marine UAS Officer is qualified and capable of operating the aircraft himself/herself.

4. C2 Operating Concept

As alluded to previously, the rationale behind the Group 4 UAS staffing differences includes not only cultural perspectives, but is also affected by the respective C2 CONOPS applied. The Army contends that the UAS is an organic asset to be tasked and immediately responsive to the ground force commander (centralized control, centralized direction for execution). The Air Force centrally manages tasking aircraft to requirements but requires its crews to determine the best method of support to the commander (centralized control, decentralized execution).[140]

The C2 concept of UAS operations (centralized vs. decentralized) and resultant authority required by aircrew relate directly to officer vs enlisted decision.

B. Designation Practices Regarding Military Personnel

During the maturation of the Service UAS programs, each Service has developed unique organizations and specialty personnel codes to identify those who operate these systems. While UA operations have been ongoing in some form for over 80 years, the development of unique UAS organizations is much more recent. The Army has a long history of operating UAS, and, in terms of "modern" UAS, it started operating with the Pioneer as early as 1985. The Army has had a unique UAS MOS since at least 1993; however, in 2007, the MOS changed from one inside the intelligence branch to one within aviation. Like the Army, the Marine Corps' rich history with UAS led to the establishment of the first UAS Company in 1987 (later developed into a full squadron, VMU-1, in 1996).

140 As articulated in Major Travis Burdine, USAF, "The Army's 'Organic Unmanned Aircraft Systems: The Unhealthy Choice for the Joint Operational Environment," *Air and Space Power Journal*, Summer 2009, http://www.au.af.mil/au/afri/aspj/airchronicles/apj/apj09/sum09/burdine.html.

97 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

While the Marines have always had enlisted operators, the maturation of the career field led to the establishment of an officer UAS MOS in 2013. The Air Force established the first RPA squadron (11 RS) in July 1995 and initially established an AFSC designating an RPA pilot. Then, in 2009, it established the pipeline training and AFSC for those pilots who had not previously flown in other aircraft and were selected and assessed purely for RPA operations. A unique Air Force Sensor-Operator AFSC (previously filled by imagery analysts) was also established in 2009. Finally, the Navy has established unique enlisted classifications to designate those involved in UAS operations; however, unlike the other Services, it relies on accessions from those pilots who have flown other aircraft. Figure 9 shows a summary of the unique personnel identifiers across the Services.

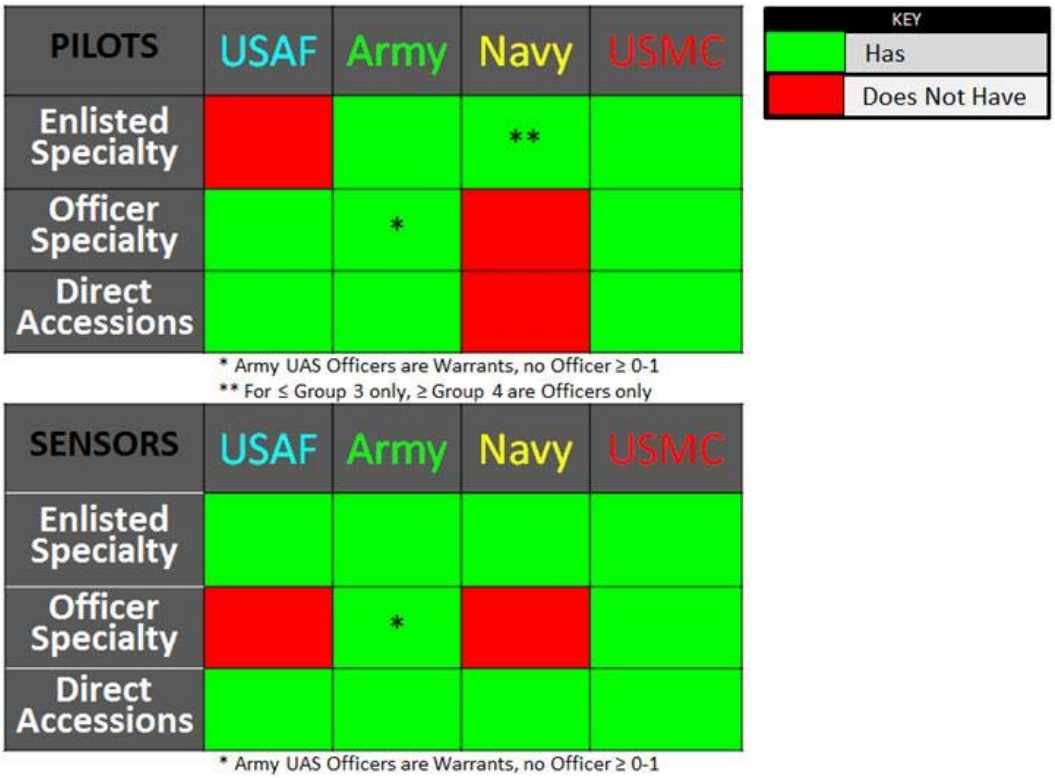

Figure 9. Unique UAS Personnel Identifier Summary

This discussion has highlighted the major similarities across the Services, with a few exceptions. The Navy and Air Force officer pilots are not formally trained to operate the associated UAS payloads, whereas the Army and Marine Corps pilots are qualified on the whole system. For the Marines, this decision is attributable to the simple nature of the platforms used. The Army, for its part, does not have a unique identifier for those officers whose rank is greater than or equal to O-1. The WOs are trained much like their Marine counterparts—to operate as technical experts on the entirety of the weapons system. However, that sentiment may be changing within the Army. The recent Army UAS Roadmap, when outlining the program's mid-term goals (2016–2025), expresses the desire

98 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

to develop an officer UAS corps as a portion of its force. To address the rapid technological advances and increased autonomy associated with UAS, the roadmap stresses that such advances "do not replace thinking leaders capable of dealing with a wide variety of threats spread across the spectrum of operations."[141] To further develop leaders who would be ready to address such challenges, the roadmap decrees that "**the Army should establish a commissioned officer UAS career track** or an additional skill identifier."[142]

The Army stated the need for commissioned officer UAS career track or an additional skill identifier.

While these differences have been noted throughout this paper, the Navy is the only Service to limit the piloting of their Group 4/5 UAS to those pilots who have flown other aircraft (see Table 12 and Table 13).

The Navy is the only Service that does not allow direct accessions to perform Group 4/5 pilot duties.

In discussion with Navy staff, the rationale for not allowing direct accessions has centered on risk and training costs. The contention is that prior training, in aircraft operations and similar mission tasks (e.g., P-8), reduced risk in comparison to training someone who has never flown in a manned platform. It was also stated that this was a less costly model since additional training was not required for a new and unique cadre of personnel. However, this model is true only if the need to fill UAS pilot slots does not create an increase in rated officer requirements across the Navy. The assumption is that the rated officers filling the UAS roles are taken from non-flying-related shore duty assignments. Additional analysis is recommended for the Navy to determine whether (1) these shore duties can now go vacant and/or (2) shore duty assignments previously filled by rated officers can be sustained through the use of other career fields.[143]

---

141 U.S. Army, *Unmanned Aircraft Systems Roadmap 2010–2035*, 54.

142 Ibid., (emphasis added).

143 In an era of budget and personnel constraints, a full analysis of shore duty requirements and available manpower is recommended to ensure that the addition of Group 5 UAS operations does not result in an increase in previously rated officer requirements—thereby possibly negating the Navy's "less costly" assumption (similar to what occurred with the Air Force, as demand increased dramatically).

99 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

A point of interest is that the Navy's rationale for using previously rated pilots was the same given by the Air Force when it initially established its RPA fleet in 1995.[144] Although it took 14 years, the Air Force now has a specific pipeline for training direct accessions to conduct Group 4/5 RPA operations at a cost that is 95% less than UPT and training time that is half as long as UPT.[145] This pipeline has reportedly produced qualified aircrew without an increase in safety incidents, as was initially feared.[146] A similar progression is seen in the other Services with the development of UAS specific training pipelines that now focus on direct accessions as the primary source of personnel. If the Navy continues to pursue this staffing methodology in its nascent UAS program, it is safe to assume it will face similar challenges as the AF and face unsupportable manpower requirements as proliferation of UAS within fleet operations becomes more prominent.

C. The Role of Technology

Through the review of current Service practices, the associated UAS roadmaps/ vectors, and developmental opportunities in and out of Defense channels, the research team observed that not only is the demand for UAS reaching an insatiable level, but that the associated technology is also maturing at an exponential rate.

Demand for and development of UAS technology is in a period of exponential growth within the defense and commercial industries.

---

144 The Air Force conducted several studies in the infancy of its RPA program to determine if prior aircrew experience was required (and to some extent addressed the Air Force vs. Officer question). A 1998 Air Force Research Laboratory (AFRL) study concluded that prior aviation experience was required and that the skills learned in UPT were critical to flying RPA. In 2002, AFRL executed a more robust evaluation (addressing only MQ-1B operations) and concluded that "stick and rudder" skills were indeed required so that these pilots could be instructed to an appropriate level through various training venues. (The 2002 evaluation compared UPT grads, RPA pilots, Reserve Officers' Training Corps (ROTC) students and civil aviators.)

For more information on these 1998 and 2002 studies, see Ellen M. Hall and William C. Tirre, *USAF Air Vehicle Operator Training Requirements Study*, AFRL-HE-BR-SR-1998-0001 (Brooks AFB, TX: Air Force Research Laboratory, Human Effectiveness Directorate, January 1998), http://www.dtic.mil/cgi-bin/GetTRDoc?AD=ADA340960; Brian T. Schreiber et al., *Impact of Prior Flight Experience on Learning Predator UAV Operator Skills*, AFRL-HE-AZ-TR-2002-0026 (Mesa, AZ: Air Force Research Laboratory, Human Effectiveness Directorate, Warfighter Training Research Division, February 2002), http://www.dtic.mil/dtic/tr/fulltext/u2/a401588.pdf. The 2002 study was supported by contracted parties from Lockheed Martin and Link Simulation and Training.

145 Cost is a comparison of undergraduate RPA Training and UPT for fighter pilots (T-6, T-38, and Introduction to Fighter Fundamentals). When compared to UPT, for those pilots going to transport or tanker aircraft (T-6 and T-1), URT is 90.6% less costly. Savings are even greater when Major Weapon System (MWS)-specific training is added (i.e., F-16, C-17, MQ-9, and so forth).

146 Multiple discussions with AF/A2CU and A3O Staffers.

100 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

While an in-depth review of technical advancements is beyond the scope of this paper, it is important to note the potential impact that technology development can have on UAS staffing methodologies.

Each of the Services is pursuing its own initiatives to capitalize on the rapid development of UAS technology, to include everything from enhanced sensors to increased autonomy associated with aircraft control. The Air Force's RPA Vector report[147] emphasizes the potential that is available within the SUAS fleet and outlines several innovations underway to evolve these systems so that they can be applied in a much broader scope at the operational and, possibly, strategic levels of engagement. However, the Air Force does not address which category of performer it would use to control such operations. Questions arise (e.g., Will these platforms be capable of executing the missions and roles currently conducted by the Group 4 MQ-1/9? If so, is an Air Force officer pilot still required because of the mission or does the simplicity of the aircraft enable enlisted aviators?).

Although the Group 2/3 UAS currently in service are strictly controlled via LOS operations, technology is currently available to enable BLOS operations. As this technology matures and is fielded (in the short term), there is the possibility to operate these UAS under an RSO construct similar to the larger Air Force and Navy programs. The same could be done with the Army's MQ-1C, thereby eliminating a substantial rotational force requirement. In addition to BLOS technology, the Army, Navy, and Marines have significant interest in unmanned technology within domains other than just the air (i.e., ground and sea). This prevalence of unmanned technology across the domains drives an increased desire—and eventual combat requirement—to simplify and integrate these systems. The Navy has already demonstrated such integration and simplification by using rotary wing UAS designed to deliver supplies to deployed forces with little more than 5 minutes of operator training and a mobile tablet device.[148] In terms of maturing UAS technology, the topic of the day has been the concept of "swarming" UAS (increased autonomous control enabling hundreds of smaller platforms to conduct missions now reserved for the current HD/LD aircraft). As this concept comes to fruition, definite opportunities exist for reducing manpower costs while increasing capacity provided by an increased density of assets. Overall, the observation related to this topic is rather simple:

Maturation of technology will have an impact on the force presentation and staffing methodologies used within DoD's UAS enterprise.

147 United States Air Force, *RPA Vector: Vision and Enabling Concepts 2013–2038.*

148 The Navy flew the first remotely piloted aircraft, an N-9 named *The Wild Goose*, on September 15, 1924. See Callahan, "Reinventing the Drone, Reinventing the Navy (1919–1939)," 105.

101 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

D. Summary

Table 16 lists seven observations of UAS staffing methodologies to bear in mind when considering the Service programs.

Table 16. UAS Staffing Observations

1	Service culture shapes how the roles and responsibilities are viewed for individual category of performers.
2	DoD-assigned missions/responsibilities and the anticipated operating environment shape how the Services view the role of their UAS.
3	The C2 concept of UAS operations (centralized vs. decentralized) and resultant authority required by aircrew relate directly to officer vs enlisted decision.
4	The Army stated the need for commissioned officer UAS career track or an additional skill identifier.
5	The Navy is the only Service that does not allow direct accessions to perform Group 4/5 pilot duties.
6	Demand for and development of UAS technology is in a period of exponential growth within the defense and commercial industries.
7	Maturation of technology will have an impact on the force presentation and staffing methodologies used within DoD's UAS enterprise.

Overall, the analysis of the individual Service staffing models demonstrates significant differences between each. However, in many cases, these differences are justifiable when viewed against the mission requirements of a particular Service's UAS force. While the choice to staff using different categories of performers is justifiable in some cases, it does not mean that current practices are always best. As technology matures, these methodologies should be reassessed as this inevitable increase in both capability and capacity will likely prove current staffing principles unsupportable given the likely continuation of a fiscally constrained operating environment. Analysis of this community highlights not only the ability to gain substantial manpower efficiencies, but also the opportunity for increased cooperation across the Services to capitalize on lessons learned within the enterprise. The next chapter will analyze aspects of UAS missions to identify potential alternative staffing methodologies.

102 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

This page is intentionally blank.

7. Mission Element Analysis

In comparison to contemporary aircraft systems, UAS offer a unique opportunity in terms of manpower management. The CONOPS combined with the sortie duration (time between takeoff and landing) enable—and in some cases necessitates—multiple individuals to be at the control during the sortie. While this requirement is especially true for the larger Group 4/5 UAS, the rapid development of technology is increasing the capability and flight time associated with the smaller systems, where multiple-crew CONOPs will quickly become the norm.[149] With this in mind, before analyzing staff methodology alternatives, this chapter dissects the basic elements of a UAS sortie to analyze which category of performer is capable of conducting each element. Such analysis raises opportunities for potential force mix efficiencies. For example, as discussed earlier, military incumbency is required for the employment of weapons; however, for Group 4 UAS, the act of employing weapons from a UAS may only take 1 hour (to include the operational prep, communications, and so forth) of a 22-hour sortie. Is there an opportunity to use a different category of performer for the remaining 95% of the sortie?

The review of current Service practices highlights that despite differences in force presentation and operating concepts, the basic mission elements associated with a UAS mission are rather static. The basic mission elements used for this analysis are as follows:

- Launch and recovery operations,
- Transit operations,
- ISR collection,
- Support to deployed forces (combat and non-combat), and
- Weapons employment.

Analysis using these basic mission elements will use the category of performer decision tree described in Chapter 3 and will remain Service and platform agnostic. The elements selected are generic enough that they apply (or can apply) to all UAS operations. For example, a Marine Corps UAS conducting a force reconnaissance mission would include launch and recovery operations, transit operations, and ISR collection and may include support to deployed forces (combat). If Air Force operations within Libya are analyzed (no ground troops), elements would include launch and recovery operations,

[149] Some CONOPS will still include a single crew/operator per mission. This situation is not limited by aircraft size (i.e., only Group 1) but rather by how the system is employed. As Group 1 UAS capability improves to include the potential of swarming, it is quite possible that separate operators would control the launch and transit while another crew(s) is conducting the operation itself.

104 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

transit operations, ISR collection, and weapons employment (under a SCAR mission).[150] In contrast, Army National Guard UAS supporting humanitarian response to a regional flood would include launch and recovery operations, transit operations, and support to deployed forces (non-combat). The key is that each of these elements helps to break down UAS operations into their simplest form and allows us to analyze the manpower requirements regardless of current or future system capabilities.

A. Launch and Recovery Operations

Launch and recovery operations include the physical act of taking off and landing the aircraft, along with operations within and around the terminal location (often an airfield or an afloat forward staging base). These functions are analogous to operations within civil aviation and do not represent an IG task. As Figure 10 depicts, the launch and recovery operation decisions move to the right side of the figure, where the answers are completely dependent on risks that the operational commander is willing/able to accept based upon the operating location. For example, if a UAS team is traveling with a forward-deployed Marine infantry element, operating conditions could include risk that is considered unacceptable for civilians (DoD and/or contracted). On the other hand, if an operating location is rather secure and a civilian organization is able to meet operational demands associated with that location, a contracted force can conduct UAS launch and recovery operations. However, if operational requirements cannot be met, the launch and recovery operation decisions move to the left side of the figure. Through this line of reasoning, the figure shows that military incumbency is not required for basic launch and recovery operations. The question then becomes whether the risk of the operating location is acceptable for a civilian. In either case, a cost-based analysis is required to compare the cost of a contracted operation with that of a civilian and/or military force.[151] Several illustrative examples will show how to analyze operational requirements and determine the appropriate category of performer.

---

[150] United States Air Force, *RPA Vector: Vision and Enabling Concepts 2013–2038.* SCAR missions were routinely flown by Air Force UAS crews.

[151] Civilian positions are inherently less costly than their military counterparts, so, in terms of a pure cost analysis, a contractor vs. civilian counterpart is most telling. In the case where no government civilians are available (as is currently the case), this point would be moot. However, for this analysis, the assumption is that government civilian UAS operators are a viable solution.

105 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

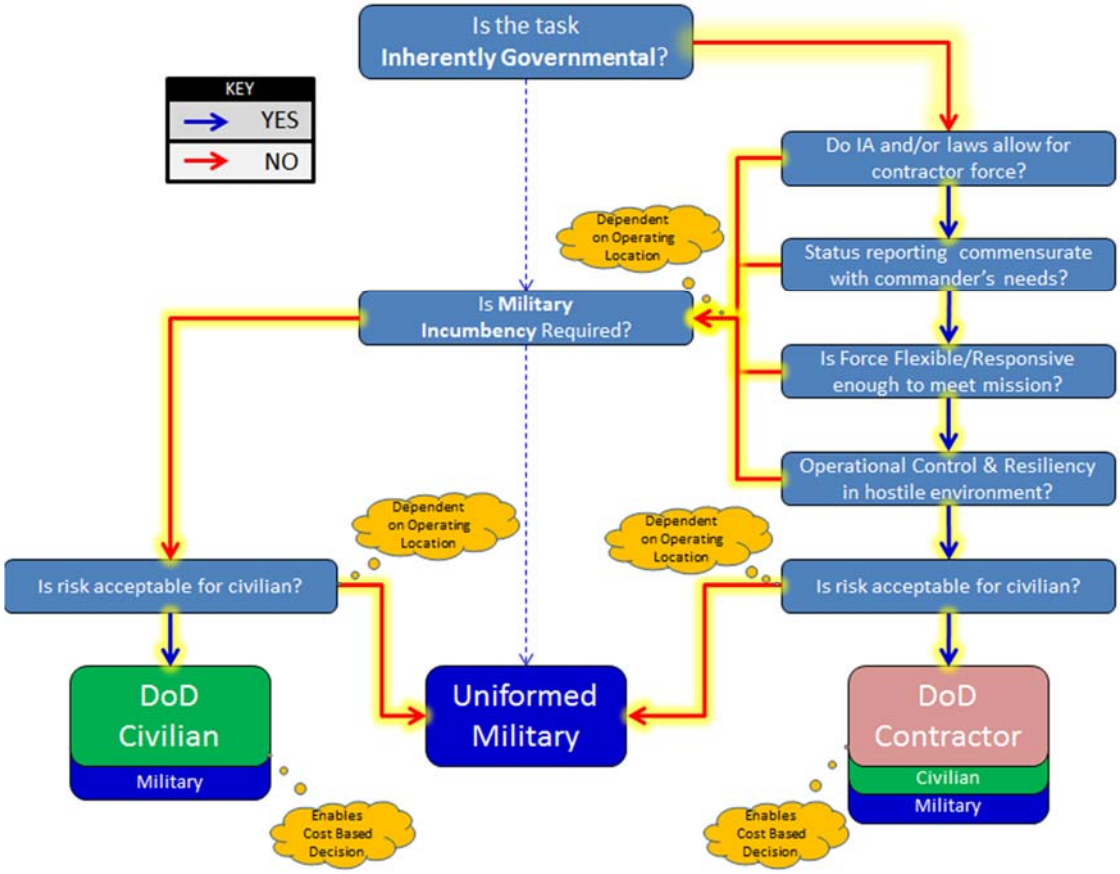

Figure 10. Category of Performer Decision Tree (Launch and Recovery Operations)

The first example is a Group 4 LRE located in southern Europe (providing support to the Mediterranean region). In this case, the location is very secure and has a well-established logistical supply chain. Assuming that a contracted force can meet the desired requirements, the cost for such a contract must be compared with the government civilian and/or military options. In contrast, an operating location out of a Northern Africa nation may not be as secure, and, therefore, risk to force/mission now plays a larger role. In some cases, launch and recovery operations must be prepared to move locations upon short notice to respond to emerging requirements and/or threats. In cases where operational requirements create additional cost requirements, the cost benefit will likely quickly favor the government civilian/military option.

In addition to these examples, new operating concepts/environments and associated technology development have quickly enabled operations from naval vessels. This case is another instance in which the operational risk associated with operating from a combat platform at sea must be included in the overall decision.

The one caveat to these examples would be if operations included base or ship defense for which the crews were required to employ weapons; however, this aspect is addressed

106 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

in the subsequent weapon employment mission element. While these examples illustrate the multiple variables associated with this decision, when analyzing manpower costs, launch and recovery operations lend themselves to a civilian work-force.

B. Transit Operations

Transit operations (see Figure 11) are the part of the mission during which the aircraft travels to/from its terminal location to its operating location. Transit operations can also include travel between various operating locations. Similar to launch and recovery operations, transit operations are not IG nor do they require military incumbency. Therefore, the category of performer decision is primarily based upon an operational risk and cost assessment. Like launch and recovery operations, transit operations open the possibilities of a civilian workforce (i.e., DoD civilian or contracted force).

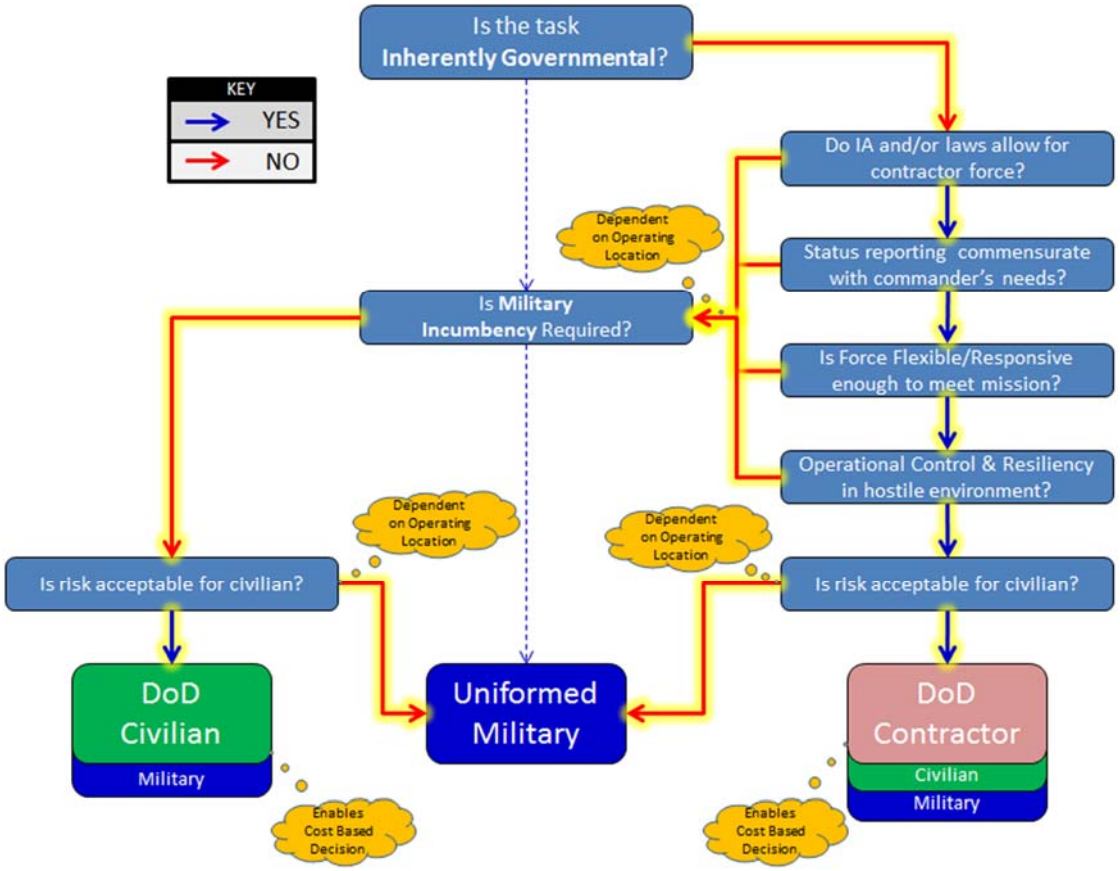

Figure 11. Category of Performer Decision Tree (Transit Operations)

C. ISR Collection

ISR collection includes operating the aircraft during the more "traditional" UAS role of collecting various data that include full-motion video, signals intelligence, synthetic

107 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

aperture radar, and so forth. While there can be significant debate on the IG nature of this activity, ample evidence is available of the willingness of the U.S. Government to contract the services required for this mission set. Therefore, it is inferred that the act of collecting these data is not IG.[152] Therefore, much like the two previous mission elements, Figure 12 depicts the decision tree enabling a risk/cost analysis that identifies this operation as being open to a civilian workforce.

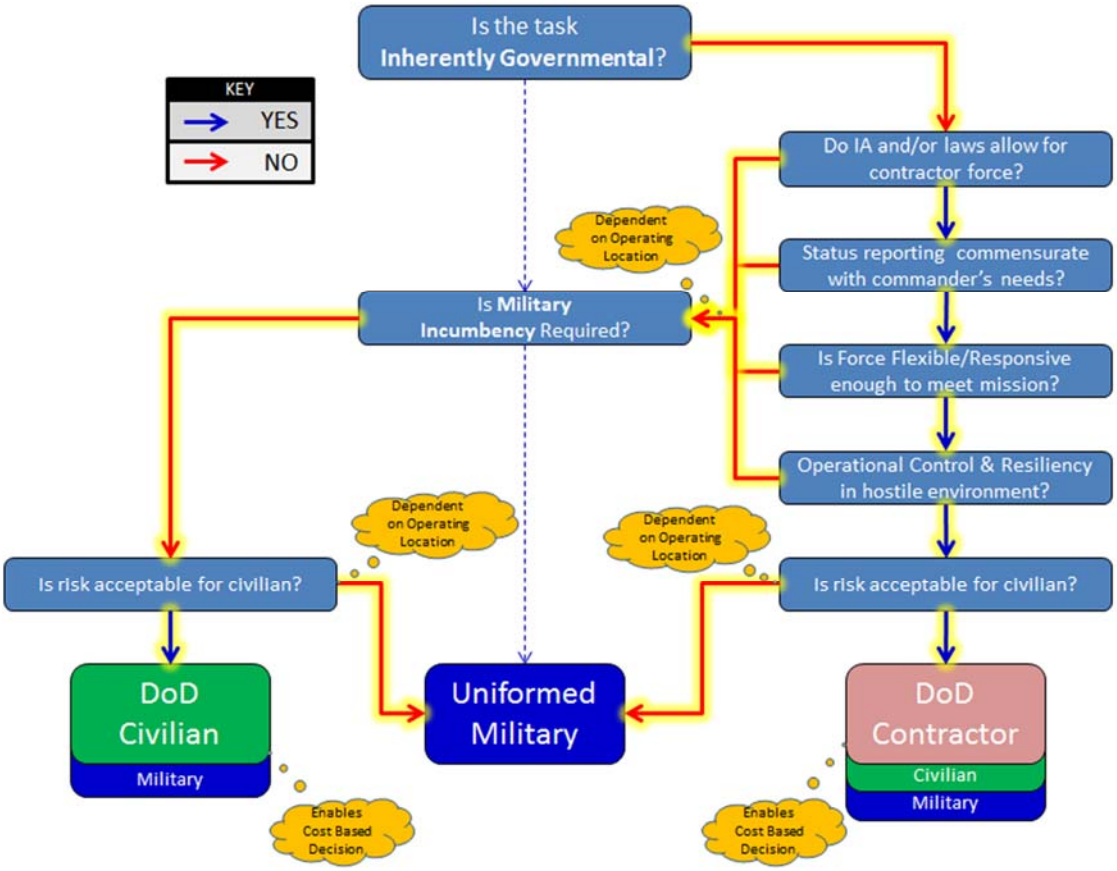

Figure 12. Category of Performer Decision Tree (ISR Collection)

D. Support to Deployed Forces (Combat and Non-combat)

The mission element of support to deployed forces was divided into two separate subcategories: combat and non-combat. In this mission element, the term "deployed" refers to forces that are "outside the wire" or rather beyond the confines of a secured operating location. Those operations within the combat subsection include operations such as direct action (i.e., raids) and convoy escort and operations in support of a naval force since such

[152] Analyzing and exploiting the data to produce intelligence products is also debated but is not within the scope of this research.

108 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

an element must always be prepared to defend the fleet. As depicted in Figure 13 and discussed previously, this type of support should be considered IG. As such, the subsequent decision is based upon operating location and associated risk. Secure and safe locations, such as U.S. operating locations for Air Force RSO, enable a cost-based analysis that shows DoD civilians as a potential cost-saving alternative. On the other hand, if forces are deployed forward in a combat zone, that calculus may require military incumbency based on the threat to force, maneuver requirements, and/or the defensive posture associated with that mission.

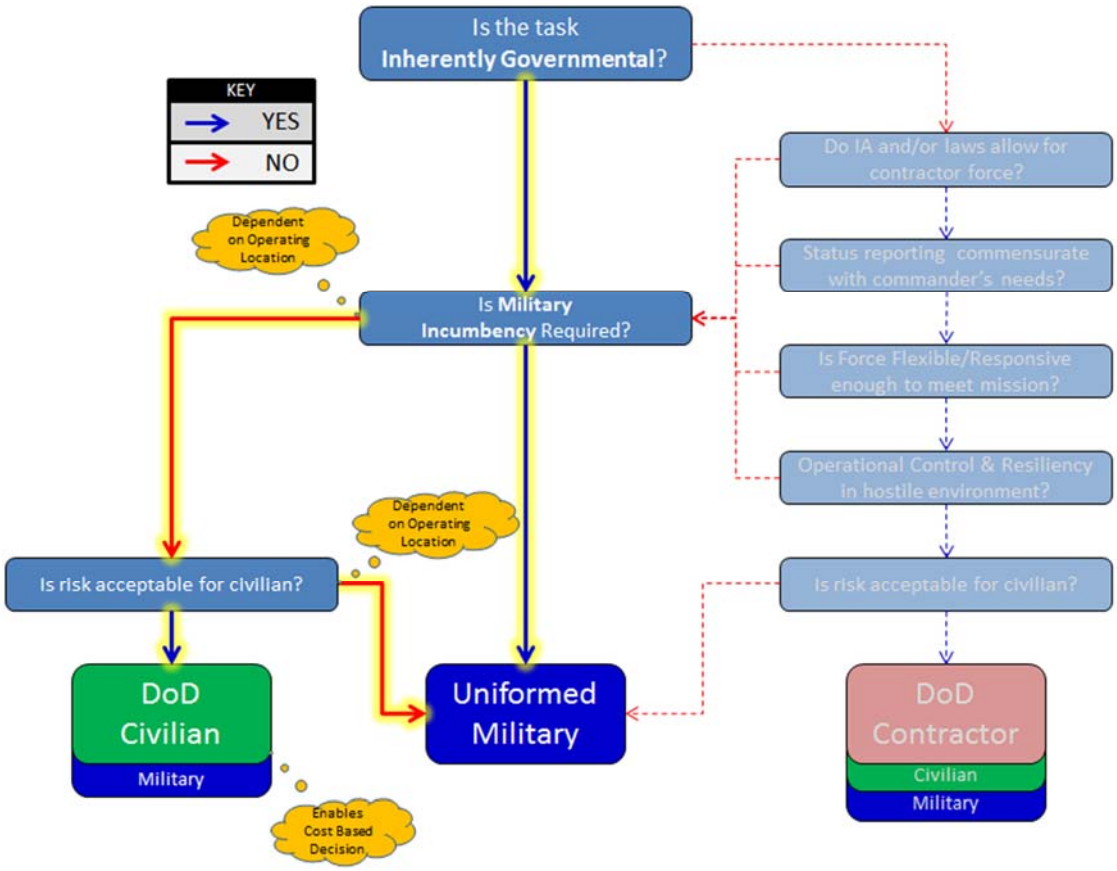

Figure 13. Category of Performer Decision Tree (Support to Deployed Forces (Combat))

In contrast, "non-combat" support operations include overwatch of a force providing humanitarian assistance to an affected region or non-combat personnel recovery operations. Such operations are not IG and therefore, as depicted in Figure 14, the decision is similar to those where DoD civilians and contractors are appropriate in this role. In these situations, risk associated with operating locations will not necessarily come from enemy combatants, but rather from environmental dangers (e.g., a natural disaster) or local criminal elements.

109 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

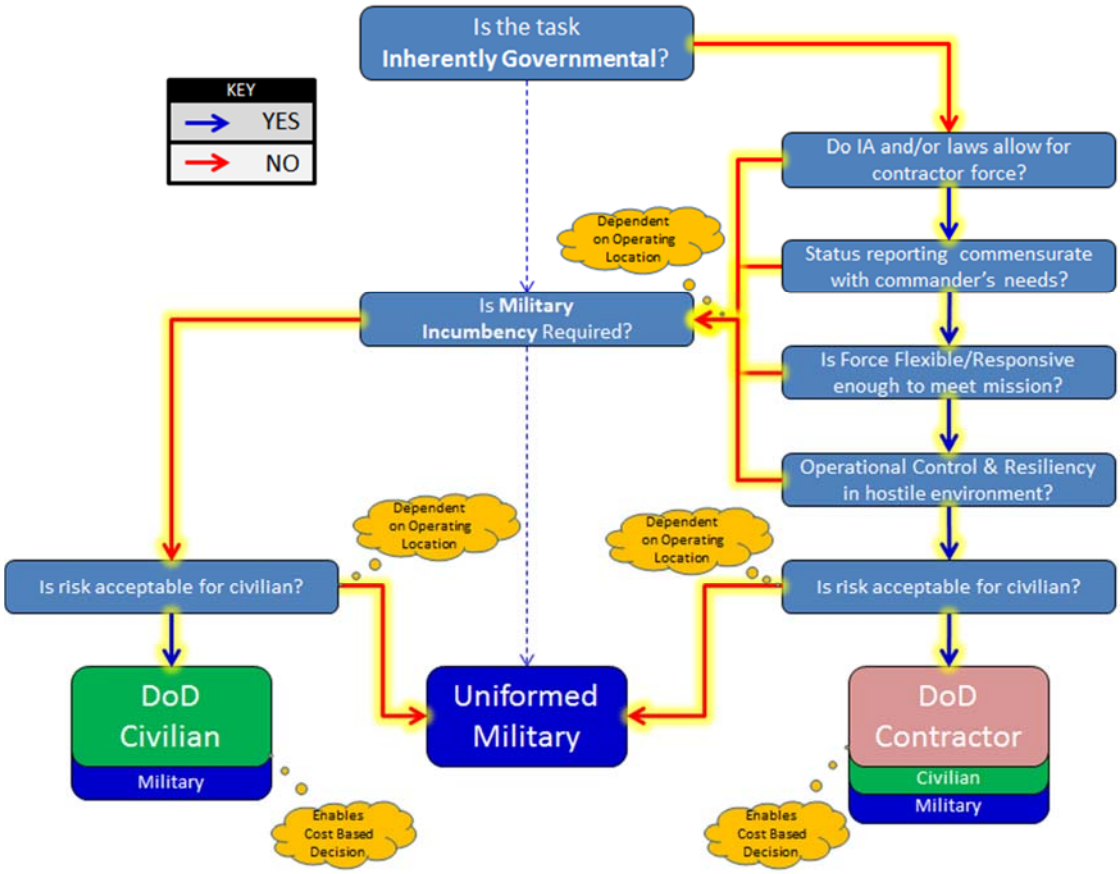

Figure 14. Category of Performer Decision Tree (Support to Deployed Forces (Non-Combat))

E. Weapons Employment

Using the definition provided in Chapter 3, which includes "the employment of, and/or provides terminal guidance to, kinetic weapons," military incumbency is clearly required.[153] As stated in DoDI 1100.22,

[153] As outlined in Appendix A, "kinetic weapons" refer to those weapons that depart an aircraft or are employed from another source (i.e., bombs, missiles, artillery, and so forth). Effects from other sources, such as electronic spectrum or cyber means, are not considered in this analysis.

110 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

> … manpower shall be designated military … if the *planned use of destructive combat capabilities is part of the mission* assigned to this manpower … includes manpower located both *inside and outside a theater of operations* if the personnel operate a weapon system against an enemy or hostile force (e.g., … *unmanned aerial vehicle operators*).[154]

The decision, therefore, is then left to officer vs. enlisted (see Figure 15). Subsequent chapters will address factors associated with authority to the release a precision guided munition but the employer of that munition may indeed be either officer or enlisted.

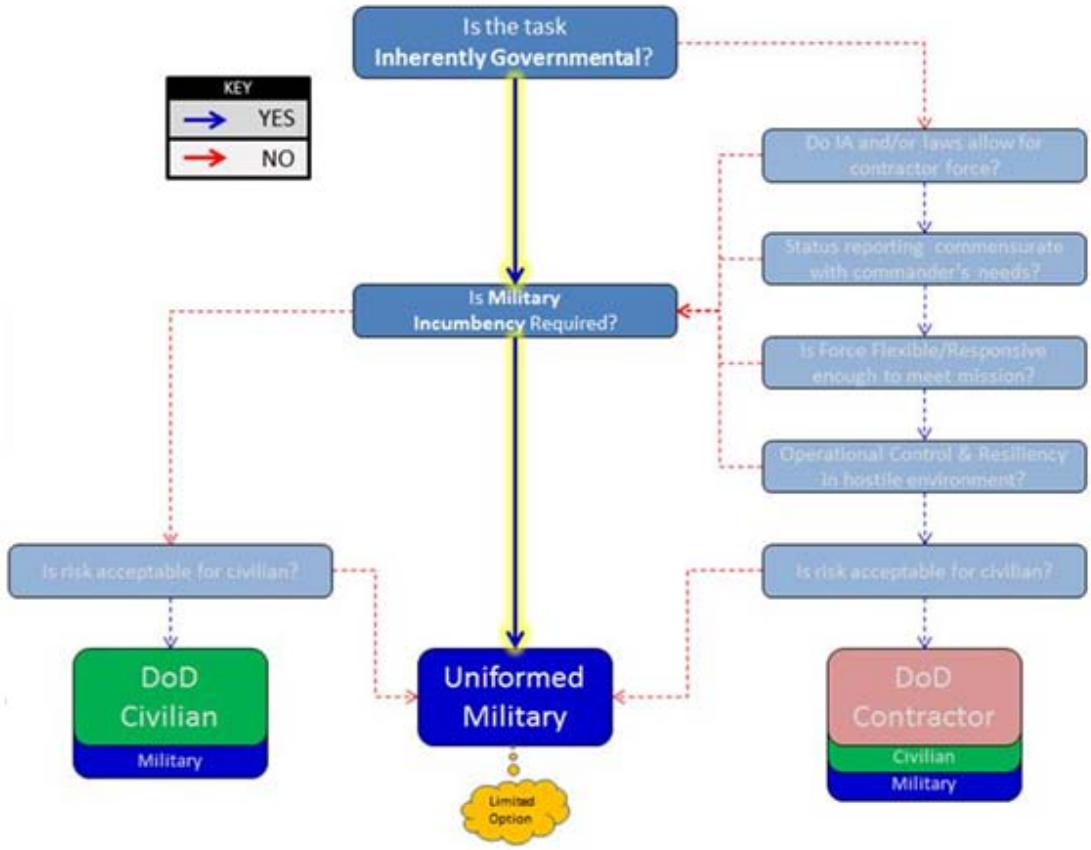

Figure 15. Category of Performer Decision Tree (Weapons Employment)

F. Summary

In reviewing each of the mission elements associated with UAS operations, an apparent opportunity is highlighted. Although DoD civilians are not currently used in UAS operations, analysis shows definite opportunities within the enterprise for government civilians. As depicted in Figure 16, the only mission element that is not allowed for the civilian workforce is the employment of weapons. Already a small subset of the DoD UAS enterprise, executed primarily by the USAF and small portion of the Army's fleet, as proliferation of UAS across DoD missions continues, weapons employment will involve only a small fraction of the total force. In this regard, an organization responsible for weapons employment has an opportunity to balance its force to meet mission requirements while also taking advantage of the cost savings associated with civilian billets. Analysis also showed that a contractor-based force can conduct most of the mission elements. With this information, analysis will now focus upon identifying alternative staffing models across the UAS enterprise.

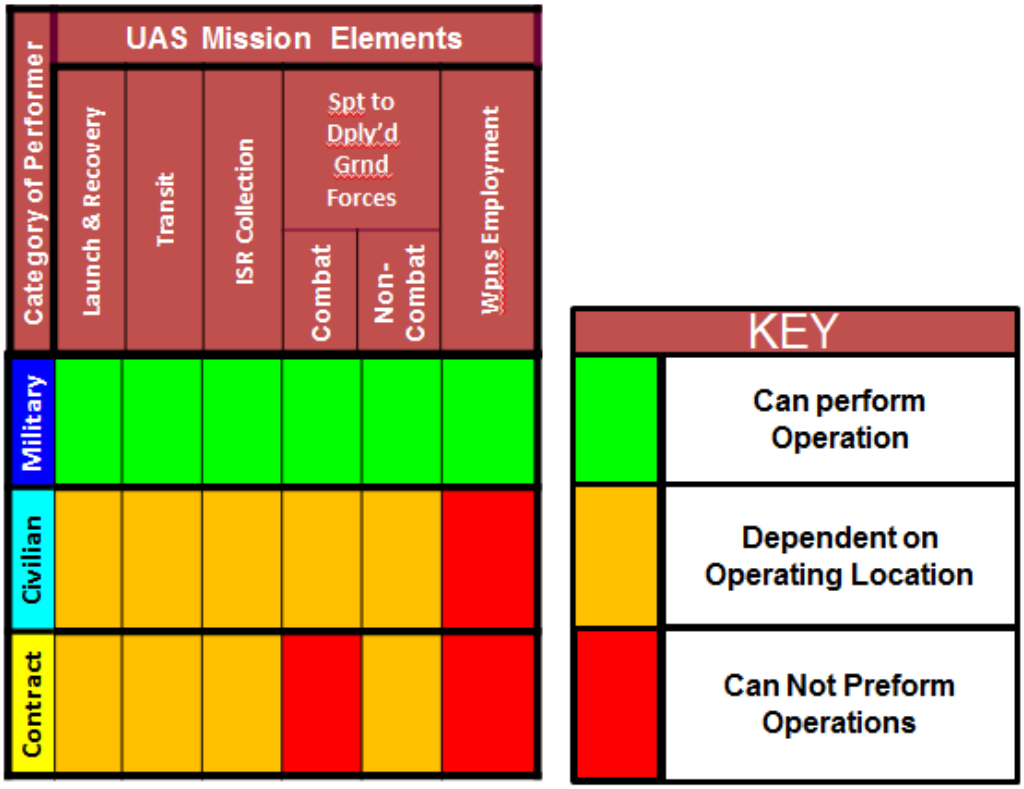

Figure 16. Summary of Mission Element Analysis

This page is intentionally blank.

8. Staffing Alternatives

Analysis aimed at identifying alternative cost-saving staffing strategies for the DoD's UAS enterprise identified multiple variables that affect each of the Services' force mix decision-making process. The following force mix alternatives take into account the individual Service roles and missions. Since operational requirements vary widely, some generalities associated with each Service were made. For example, the Marine Corps expeditionary nature requires a capability to operate within hostile and austere environments. This assumption alone drives a necessity for the use of military personnel; however, the following analysis highlights factors that may change that calculus. The following alternatives are organized along category of performer delineations, and, while the alternatives are segregated as such, aggregate variations may indeed be possible.

A. Use of Civilians

> **Manpower shall be designated as civilian except when military incumbency is required ….**[155]

The previous mission element analysis showed that DoD civilians can conduct all aspects of a UAS operation, except when weapons employment is required. Although this exception currently affects only the larger Group 4/5 UAS, the Services must consider when they are planning future capabilities development. Understanding that government civilian billets come with an inherent cost savings over military positions, two alternatives are recommended for further analysis to balance cost-savings with mission requirements: civilian applications to either (1) the LRE and (2) the mission command element (MCE) (i.e., transit and basic ISR collection).

While the following alternatives capitalize on cost savings associated with civilian manpower, several variables beyond the scope of this analysis are associated with the ability to hire civilians into such positions. These factors include operations tempo, shift work, potentially undesirable operating locations, and the strength of the civilian UAS market.[156] In addition, supporting research is required to understand both the availability

---

155 Department of Defense, "Guidance for Manpower Management," DoDD 1100.4, 3.

156 See Bureau of Labor Statistics Website, "Occupational Employment Statistics," accessed January 26, 2015, http://www.bls.gov/oes/home.htm. The Bureau of Labor Statistics' Occupational Employment Statistics (OES) program produces such analysis for over 800 various occupations. As of the writing of this paper, the OES had not yet conducted such analyses on the UAS/RPA market. While extensive

114 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

and accessibility of a civilian UAS workforce to feed, and sustain, DoD requirements. If such a pool of individuals do not exist, or won't for several years, this may not be a viable option for the short term. However, if such a workforce is available, their experience and potential longevity in service, without the need to meet military developmental requirements, may provide additional long-term savings. For this paper, to illustrate potential cost savings within the enterprise, the following alternatives assume that these variables are *not* factors.

1. Launch and Recovery

The decision to use government civilians to launch and recover UAS is primarily reliant upon the risk associated with the operating location. The Marines are expected to provide an expeditionary presence that is able to deploy forward and maneuver within hostile and austere environments while employing offensive tactics in defense of their positions (i.e., "pick up a gun and fight"). Therefore, civilian operators do not fit most of the Marine UAS operations.[157] On the other hand, through the use of contractors (e.g., GOCO/COCO UAS), DoD has already demonstrated a willingness to deploy civilians to secure forward operating locations and/or on Navy combat vessels in a variety of positions.

As mentioned, the Marines and the Army are currently focused on smaller UAS systems that are organic to maneuver-type units. These types of operations tend to call for military incumbency; however, as operations become more secure and/or larger systems are used, additional opportunities for civilians will be available. Currently, this situation is the case for the Army, Air Force, and Navy Group 4/5 UAS. As the larger aircraft are typically launched and recovered from secure locations, the associated risk is typically acceptable for government civilians.[158] Since the Air Force has the largest number of Group 4/5 UAS, the following alternative uses Air Force's program numbers even though the concept also applies to Army and Navy programs.[159]

The Air Force MQ-1/9 program of record currently includes 15 LREs.[160] To support this requirement, the Air Force assigns each of its RPA units a portion of LRE billets. As

---

market research (e.g., salaries, job requirements, work force demand, and so forth) could address this challenge, it is well outside the scope of this paper.

157 The same can be argued for certain Army infantry units that also operate in this manner.

158 This approach is evident in current operations by the number of civilians on forward operating bases where UAS/RPA operate. In future non-permissive environments, this situation may not be the case; however, these particular UAS are not prone to launch and recover within a non-permissive environment.

159 Due to several variables which are beyond the scope of this study, generalities are used to illustrate a basic analysis.

160 Telephone interview with Maj Michael Lewis, HAF/A3, October 17, 2014.

115 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

shown in Table 17, each LRE consists of 5 pilot and 5 sensor operator billets, for a total of 10 personnel.

Table 17. USAF LRE Manning Requirements (General)

Unit Type Code (UTC) Line Number	Core AFSC	AFSC Title	Grade	Quantity
1	11U3	RPA Pilot	Maj	1
2	11U3	RPA Pilot	Capt	4
3	1U07	RPA Sensor Operator Craftsman		1
4	1U05	RPA Sensor Operator Journeyman		4

Source: Telephone interview with Maj Michael Lewis, HAF/A3, October 17, 2014

Note: Air Force LRE requirements are similar across units. Costing for sensor operators was done using 1N1 AFSC for sensor operators. In addition one E-7, one E-5 and two E-3s were used as a conservative estimation. See Appendix B for the full FCoM data. The numbers used in this table are currently under review by the Air Force since they do not represent enough individuals to meet rotational deployment requirements. The Air Force is looking at increasing the number of billets associated with its LREs to better meet demand. (Note source: Interview with RPA Manpower and Career Development Tiger Team, November 20, 2014).

If one takes all these positions and transitions them to purely civilian equivalent positions, the annual savings equate to $777,696 per LRE. In the case in which all 15 USAF MQ-1/9 LREs were converted to pure civilian operators, an approximate $11.7 million annual savings is realized.[161] However, operationally, it is understood that an all-civilian LRE force would not meet Air Force requirements. For certain LREs, the risk, base defense requirement, and/or host nation agreement will require military personnel. While others LREs are secure enough to allow an all-civilian force, there will be options in between. With this in mind, Table 18. depicts a force mix alternative across the 15 Air Force LREs that could meet an LRE civilian/military force mix.[162] As seen with four all-military LREs, five 60-40, three 20-80, and three all-civilian, the total cost savings is approximately $5.1 million annually ($25.65 million across the Future Years Defense Program (FYDP)).[163]. This savings comes from transitioning approximately half (74 of 150) of the LRE positions from military to civilian.

---

161 Annual savings based upon FCoM numbers (see Appendix B). The $776,696 and $11.7 million totals are for full savings to the Federal Government. Savings specific to DoD are $610,776 and $9.16 million, respectively.

162 A full mission analysis of Air Force LRE requirements was not conducted; however, this framework is general enough to meet a majority of Air Force LRE requirements based upon Group 4/5 LRE operations that typically occur in secure locations.

163 Ten Operational Squadrons does not include the MQ-1/9 Training squadron at Holloman AFB or the launch and recovery (LR) squadron at Cannon and Creech AFBs. Savings totals are for full savings to the Federal Government. Savings specific to DoD are $3.9 million annually and $19.48 million over the FYDP.

116 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

Table 18. Annual Costing of Air Force LRE Civilian/Military Force Mix

UTCs	Annual Cost/LRE		# of UTCs	Sub-total		Billets	
	DoD	Fed Gov		DoD	Fed Gov	Mil	Civ
RPA LRE UTC (All Mil)	1,283,861	1,592,561	4	5,135,444	6,370,243	40	0
LRE UTC (2 Civ + 3 Mil)	1,158,832	1,400,764	5	5,794,160	7,003,820	30	20
LRE UTC (4 Civ + 1 Mil)	804,398	979,562	3	2,413,194	2,938,686	6	24
RPA LRE UTC (All Civ)	673,085	814,865	3	2,019,255	2,444,594	0	30
Total for 15 All-Military RPA LRE UTCs				19,257,915	23,888,415		
Total for 15 Force mix RPA UTCs (as presented above)				15,362,053	18,757,343		
Delta (i.e., savings)				3,895,862	5,131,072		

Note: Delta is between mix depicted and all 15 military LREs.

2. Transit Operations

Another mission element in which a civilian force may be useful comes in transit operations. Once again, this section will use Air Force MQ-1/9s since they represent most of the larger UAS force. For this short example, we will use the following basic assumptions: (1) Air Force RPA squadron responsible for 5 CAPs, (2) average flight lasts approximately 22 hours, and (3) the average transit time to/from an objective area takes 2 hours.[164] Using this information, we can calculate the average percentage of scheduled flying time dedicated to transit operations:

$$\%\ \text{Sq Flying Time for Transit} = \frac{(\text{Average Transit Time to Obj} * 2)}{\text{Average Flight Time}}$$

$$\%\ \text{Sq Flying Time for Transit} = \frac{(2\ \text{hrs} * 2)}{22\ \text{hrs}}$$

$$18\% = \frac{4}{22}$$

Based upon our assumptions, this 18% of flying time associated with transit operations can, in theory, be directly applied to a percentage of aircrew required for support. With the program of record for Air Force RPA operations that require 40 pilots to support 4 CAPs, 18% of the crew force equates to 7 pilots. Using math similar to our previous

[164] The 22-hour assumption is standard for MQ-1 operations and has been demonstrated by the recently fielded MQ-9 Extended Range. The basic MQ-9 is airborne closer to 17 hours. Transit time can vary wildly (up to > 8 hours in some operating locations); however, for our analysis, Afghanistan-type transits were assumed, which would place an objective approximately 200–400 miles away (depending on aircraft and wind velocity).

117 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

calculations for the LRE civilian conversions, transitioning 7 pilot positions to DoD civilians would save approximately $560,000 annually:

$$\text{Annual Cost Savings} = (\text{Cost saving per billet}) * (\#\text{ of billets converted})$$

$$\text{Annual Cost Savings} = (\text{O-3 to GS-11}) * 7$$

$$\$559{,}573 = (\$79{,}939) * 7$$

When sensor operators are included in this conversion, the potential annual cost savings increase to around $1 million:

$$\text{Annual Cost Savings} = [\ (\text{O-3 to GS-11}) * 7\ ] + [\ (\text{E-5 to GS-5}) * 7\ ]$$

$$\$1{,}010{,}856 = [\ (\$79{,}939) * 7\ ] + [\ (64{,}469) * 7\ ]$$

Since UAS operations currently run 24/7/365 with transit operations occurring at any time of the day, a force of only 7 crews to perform all transit operations is extremely difficult to schedule operationally.[165] Therefore, we focused on transitioning a full CAP to use civilian billets (10 pilots/10 sensors). This approach allows flexibility in scheduling, as well as an understanding that the same individuals can perform basic mission support up to but not including weapons employment. As Table 19. depicts, approximately $1.37 million annually is saved by converting 1 CAP (20 billets) worth of manpower to DoD civilians.[166] If each of the 10 operational Air Force MQ-1/9 squadrons did this conversion, total program annual savings could total $13.65 million ($68.3 million across the FYDP).[167] Training and test squadrons could further capitalize on civilian manpower since they are not responsible for combat support missions.

---

165 Considerations include standard 2-day weekends, sick days, training, time to adapt for shift changes, and so forth. Included is the potential of a limited duty hour during a standard week for civilians (i.e., 40 hours). Although the Air Force is looking at the potential of using pilots only for transit operations, the current construct of also assigning a sensor operator (for help running checklists during emergencies) was used. Removal/decrease in number of sensor operators used would increase savings.

166 Since no model based upon mission analysis is available for the appropriate civil/military mix, best assumptions were made with the available data. Distribution of ranks and grades throughout the squadron was kept as close in line as possible with current Air Force RPA squadron structures.

167 Ten Operational Squadrons does not include the MQ-1/9 Training squadron at Holloman AFB or the LR squadron at Cannon and Creech AFBs. Savings represent savings to the Federal Government. DoD savings are $10.31 million annually or $51.58 million across the FYDP.

118 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

Table 19. Cost Comparison of USAF MQ-1/9 Squadron Using Civilians

USAF RPA Squadron	Annual Cost		Billets	
	DoD	Fed Gov	Mil	Civ
Current	14,223,874	17,557,834	108	0
1 Civilian CAP	13,192,353	16,192,473	88	20
[redacted]				
Delta (i.e., savings)	1,031,521	1,365,361	[redacted]	

Note: Costing considers only the UAS aircrew. Support personnel (e.g., aviation resource management and secretary) are not included.

While these numbers are specific to the Air Force MQ-1/9 program, the Army Gray Eagle companies could also realize savings. If the concept of government civilian operators is established within MQ-1/9, the RQ/MQ-4 missions, which do not include weapons engagement, should be able to accept a greater percentage of DoD civilians, providing another multi-million dollar annual savings across Air Force and Navy programs.

B. Officer vs. Enlisted

As shown in the staffing analysis, while the Services base their staffing methodologies upon their assigned mission roles and responsibilities, there may be some opportunities to transition a portion of the Navy and Air Force Group 4/5 UAS manpower from officer to enlisted. While the Army has had demonstrated success within its MQ-1C program, this decision to use enlisted operators in the Air Force and Navy requires further mission analysis to assess which portion of their respective missions can be met by enlisted pilots. For illustrative purposes, Table 20. depicts the potential cost savings associated with this transfer. The transition of 60% to enlisted pilots can provide up to $1.8 million per squadron ($18.2 million annually, $91 million in FYDP, if accomplished in all 10 operational MQ-1/9 squadrons).

119 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

Table 20. Cost Comparison of Air Force RPA Squadrons Using Enlisted

USAF RPA Squadron	Annual Cost		Delta (i.e., savings)	Pilot Billets	
	DoD	Fed Gov		Officer	Enlisted
All Officer	14,223,874	17,557,834		50	0
20% Enlisted	13,610,200	16,944,160	613,674	40	10
30% Enlisted	13,312910	16,646,870	910,964	35	15
40% Enlisted	13,000,585	16,334,545	1,223,289	30	20
50% Enlisted	12,714,217	16,048,231	1,509,603	35	25
60% Enlisted	12,401,946	15,735,906	1,821,928	20	30

Note: See Appendix B for the breakdown of positions converted. Commander (1), Operation Officer (1), and Squadron Operation Center Billets (5) are not included in enlisted conversion. In addition, the Delta is the same for the Federal Government and DoD.

1. The Marine Model Applied to Air Force and Navy Programs

The Marine Corps model could possibly be applied to the Navy and/or Air Force Group 4/5 UAS squadrons.[168] While initially sound in concept, the Marine Corps model is able to mitigate risk through its operating concept—mitigation that is enabled through technology and the oversight of operations (and associated aircraft control) available to the mission commander. In discussion with various SMEs, the complexities of the MQ-1B and MQ-9 systems associated with the lack of ground control system/operation center oversight available make it unlikely that the Marine Corps model would meet the desired responsiveness required for strategic missions that the Air Force/Navy contend require the more decentralized execution model. Although beyond the scope of this paper, it is recommended that future infrastructure upgrades and/or acquisitions be capable of supporting a manpower model similar to that of the Marine Corps.

2. Warrant Officers (WOs)

The use of WOs is typically addressed in terms of the Air Force program. As stated earlier, lacking such a program, the Air Force would have to develop an entirely new element within its force structure to support this option. To understand the full potential associated with possible manpower savings, a full business case analysis will need to include the cost of establishing a WO program and whether this program would apply to only RPA or include other AFSCs. The Navy, for its part, assessed and terminated its short-lived flight WO program since it conflicted with other force management policies.[169] Rather than disregard this option outright, this study reviewed some basic assumptions on costs associated with manpower savings as if the Air Force had a WO program established.

---

[168] UAS-qualified officer mission commander with enlisted UAS pilots controlling aircraft.

[169] Mark D. Faram, "Flying Warrant Program Gets the Ax."

120 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

Table 21 shows approximately $1.3 million potential annual savings associated with converting an Air Force MQ-1/9 squadron to a WO-centric pilot force.[170] In total, the USAF has 1,418 authorized officer billets within RPA, and converting all those to a WO equivalent would save a conservative $110 million annually in manpower costs. Further research comparing the pros and cons and costs associated with establishing a WO force structure is recommended.

Table 21. Cost Comparison of USAF RPA Squadrons Using Warrant Officers

USAF RPA Squadron	Annual Cost		Delta (i.e., savings)
	DoD	Fed Gov	
Current	$14,223,874	$17,557,834	
WO Pilots	$12,917,076	$16,251,036	$1,306,798

Note: Delta is the same for the Federal Government and DoD.

3. Limited Duty Officers (LDOs)

LDOs hold the same rank and benefits as their line officer counterparts. Therefore, while there are no inherent annual cost savings, such a program could be beneficial when considering total life-cycle costs. Since LDOs are focused primarily on their technical competence, they presumably do not require the same "broadening" opportunities as their line counterparts. Previous IDA studies have calculated an average Air Force officer's career at approximately 15 years. Presuming approximately 25% (3.7 years) of an officer's career is spent in a developmental assignment, LDOs present possible savings when considering training costs. However further analysis of the UAS community and such an LDO program is required to assess anticipated retention rates within this fledgling career field. As with the WO program, Services without a preexisting LDO program must analyze the overall cost of establishing this new force structure element and its applicability beyond the UAS community. In addition, restructuring the current policy of selecting LDOs for solely the enlisted ranks and opening such opportunities to the officer corps, may prove to provide additional life-cycle cost benefits.[171]

---

[170] Commander and Operations officer were left as Officer (O-5) billets. Transitioning the Major and Captain billets into one W-4, 28 W-3s, and 26 W-2s provided the reported savings. Since the Air Force does not have WOs available in FCoM, Army costing data were substituted.

[171] While further analysis is required, a career path to include "on and off-ramp" opportunities for the current "traditional" officer corps into the LDO might address several force management issues currently under assessment within the DoD.

121 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

C. Total Force Options

Although in-depth research into total force options was beyond the scope of this study, the research team noted a lack of integration. Not only does the Air Force have most of the larger UAS, it is also building a significant Strategic Reserve force using Air Force Reserves and Air National Guard units. However, a majority of these units support only one CAP full time, with a strategic reserve of one to two additional CAPs. Through basic operational scheduling considerations, a single CAP squadron is highly inefficient. Compounding this inefficiency is the fact that of the majority of these Reserve and Guard squadrons are not collocated with their active duty counterparts. Potential efficiencies and cost savings (material and manpower) exist in increasing integration between active duty and strategic reserve forces.

D. Joint Force Options

The apparent duplication of aircraft systems across the Services was raised on multiple occasions. It was understood that the smaller Group 1–3 platforms performed primarily organic support over relatively short time periods, which made the use of a common joint platform across multiple Services understandable. However, while CONOPS differ between the Services, use of almost identical Group 4/5 platforms seems to present several inefficiencies in terms of acquisition, operating, and sustainment costs. Although beyond the scope of this study, further research is recommended. This research should focus on potential efficiencies gained by either consolidating platforms under a single Service or by managing and operating platforms in more integrated manner and may include everything from acquisition parity/interoperability standards to more radical ideas (e.g., creating joint operational squadrons).

E. Use of Contractors

The use of contractors is widespread throughout DoD for UAS, which is understandable based upon the dramatic and rapid development of the associated demand. These systems have proven beneficial, but, since they are not part of a program of record, sustainability and integration across the force has been challenging. Although this study did not have access to the contract costs covering the wide range of GOCO/COCO UAS operations, efficiencies are likely through a more deliberate process. In addition, although contracts were often put in place as a response to an urgent need, these contracts often languished in their transition into a military operated program (e.g., Navy's use of ScanEagle contracts for almost a decade). While this study was focused on finding efficiencies within existing military UAS programs, further research is recommended on contract accountability not only for cost and meeting mission goals, but perhaps more importantly the Services' accountability in transitioning away from contracts in a timely manner when appropriate.

122 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

F. Summary

Based on the initial cost analysis performed, an in-depth costing analysis should be conducted, and this analysis should include full life-cycle costs vs. the annual cost summary estimation provided by FCoM. Analysis should focus on using civilian manpower in both the force mix proposals for launch and recovery operations and for providing each operational Air Force squadron a single "CAPs" worth (20 positions) of civilians for transit and non-kinetic ISR operations. From this initial analysis, the civilian conversion would be the most cost beneficial since previous results show a need to convert 2.5 CAPs worth of manpower to enlisted pilots to gain the same benefits as 1 CAP worth of government civilian pilots. However, detailed life-cycle analysis for the enlisted pilot cases could also provide baseline information to inform the appropriate decision makers.

While transitioning Air Force and Navy pilots to WO positions initially appears to provide annual savings, further cost analysis is required to not only show the full life-cycle costs for the individual positions, but also to include the cost of establishing such a rank structure within each of the Services for UAS operations (and if such a structure would extend beyond UAS into other career fields). Other staffing alternatives mentioned previously are either beyond the scope of this report (Total Force efficiencies) and/or are recommended for further research.

123 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

9. Summary

A. Overview

The purpose of this study was to identify alternative staffing strategies to not only accomplish DoD's current UAS-related missions in a more cost-effective way, but to also help inform and address manpower decisions for the future as current practices become unsupportable based on enterprise growth. By focusing on DoD's mission requirements, along with each individual Service's approach to UAS staffing, several opportunities were identified. While a majority of the Department's UAS missions are conducted similarly across the Services, definite unique approaches are used for the larger (Group 4/5) aircraft. While this paper outlines specific mission areas in which to gain efficiencies, the most notable savings came from considering government civilians as a viable option within the greater UAS enterprise.

This chapter summarizes the overall report and provides recommendations for further research. The preliminary costing results presented in this paper should be followed by an in-depth cost analysis providing full life-cycle costs vs. the FCoM annual cost saving estimations used in support of this analysis.

In terms of defining which individuals, or category of performers, currently conduct and/or are able to execute DoD UAS operations the following was observed.

- Only uniformed military officers can hold positions of command (includes LDOs and WOs).
  LDOs and WOs are subcategories to the officer corps used by some Services to focus on and capture long-term technical expertise.
- The Air Force lacks a WO force structure and, although authorized by Title 10, requires additional overhead to establish such a program. Similarly, the Navy lacks a flight WO program.
- The DoD expeditionary workforce is defined as a DoD civilian subcategory that is organized, trained, and equipped for expeditionary operations

For identifying statutory guidance constraints associated with defining the DoD UAS enterprise, the researchers used guidance primarily from Title 10, DoDD 1100.4 ("Guidance for Manpower Management"), and DoDI 1100.22 ("Policy and Procedures for Determining Workforce Mix"). While Title 10 outlines specific requirements in terms of generic missions (armor, infantry, strategic airlift, and so forth), it does not direct any one

124 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

Service to specifically maintain a UAS capability.[172] Nor does Title 10 direct a specific category of performer to conduct UAS operations.[173]

Title 10

Does NOT direct any singular Service to maintain a UAS program
Does NOT direct a specific category of performer to conduct UAS operations
Does NOT prescribe a percentage of force and/or rank to support UAS

While many intricacies are associated with workforce mix, DoD statutory guidance was distilled into the following three overarching questions in terms of the UAS task in question,

Force mix Analysis Questions

- Is the task inherently governmental?
- Is military incumbency required?
- Is the level of risk to force acceptable for civilians?

These questions built the framework for developing the decision tree in Figure 17 to analyze potential staffing alternatives. While this this generic roadmap is a simplification of the overall requirements, it helped define an appropriate balance across UAS missions and associated force integrated with elements of all categories of performers.

Using the decision tree in Figure 17 to review common mission elements associated with UAS operations highlighted several opportunities—specifically, the potential to use DoD civilians. As depicted in Figure 18, the only mission element that is not allowed for the civilian workforce is the employment of weapons. It was determined, however, that even in an organization responsible for weapons employment, there was an opportunity to balance its force between uniformed military and government civilians to meet mission requirements and take advantage of the associated manpower cost savings. While analysis also depicted that a contractor based force can conduct most of the mission elements,

---

172 Example: Title 10, Volume III § 3062 and § 8062 outline Congress' intent for the Army and Air Force, respectively and, in some cases, outline generic structure (e.g., Army branches). However, it does not dictate a UA program. See Armed Forces, 10 U.S.C., Volume III § 3062 and § 8062.

173 For example Title 10 § 8067 dictates that Medical, Judge Advocate, and Chaplain services be performed by officers. There is no such designation for UA programs or even for pilots in general. This IDA paper does not advocate for such direction, but rather highlights the lack of Title 10 restrictions for an unrestricted development of alternative strategies within the constraints of existing generic manpower guidance. See Armed Forces, 10 U.S.C., Volume III § 8067.

125 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

without comparable contract data, the research team was unable to determine an appropriate cost comparison.

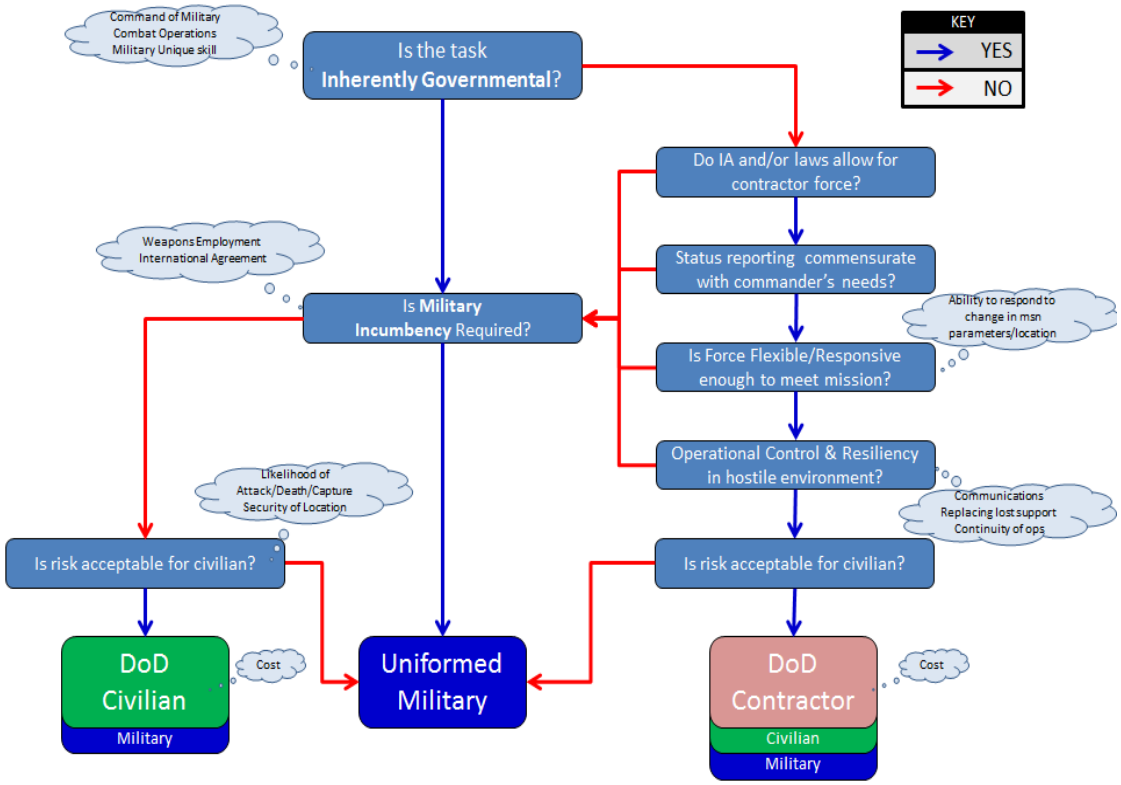

Figure 17. Category of Performer Decision Tree

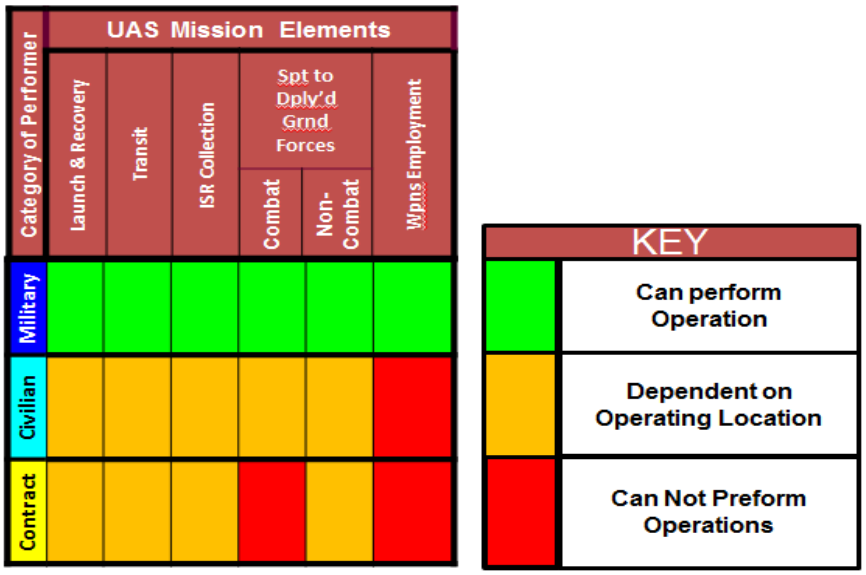
Note: Subsequent analysis further breakdowns the military component into officer and enlisted subcategories.



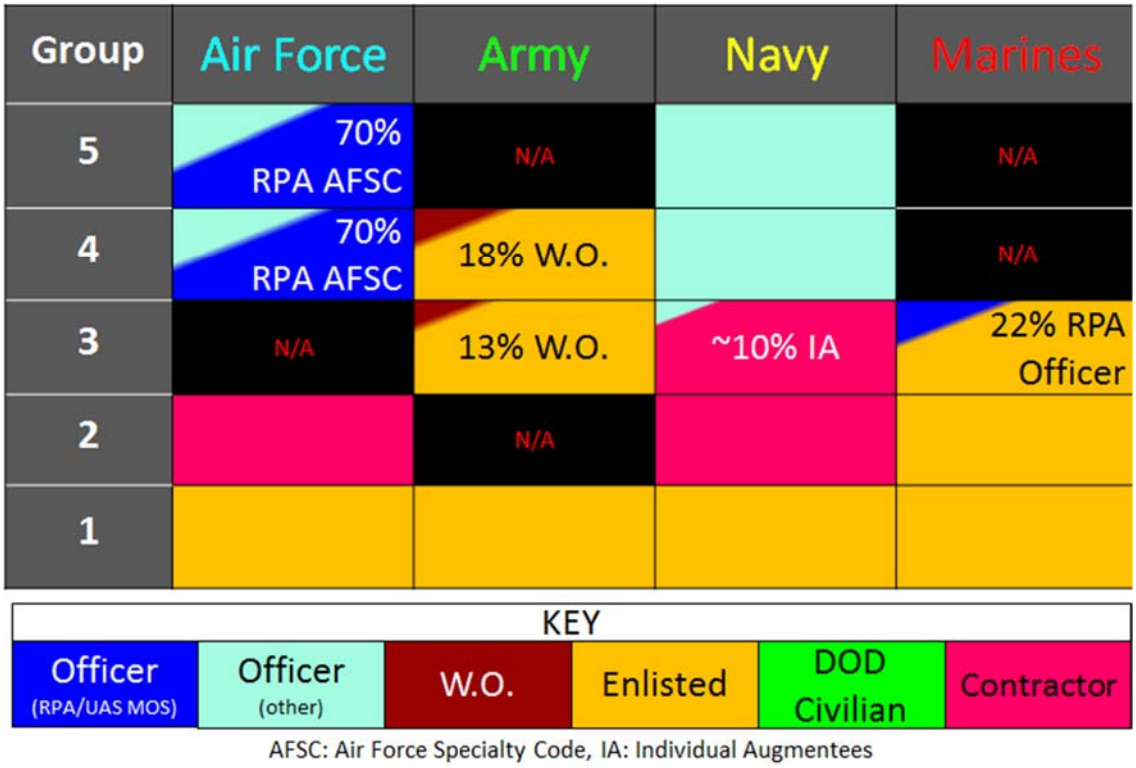


Figure 18. Summary of Mission Element Analysis

126 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

The review of individual Service's practices revealed that many UAS operations were staffed similarly across the Services; however, there are some notable differences. As seen in Table 22., one such difference is the reliance of the Army on WOs to provide leadership within their Group 3/4 UAS units, whereas the other Services rely on officers above the rank of O-1. In addition, while the Air Force and Marines have a dedicated Officer corps for UAS, the Navy and Army do not. The Navy relies on the use of previously qualified pilots from similarly tasked aircraft while the Army relies on its UAS WOs.

Table 22. Service Category of Performer Summary (Pilots)

AFSC: Air Force Specialty Code, IA: Individual Augmentees

Note: This table summarizes the primary focus of those pilots used to control the aircraft. The Air Force and the Navy have approximately one-half their Group 4/5 UAS force as enlisted sensor operators.

In an effort to better understand staffing methodology commonalities across the Services, the business rules in Table 23 appeared as universal across DoD and as platform agnostic.

127 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

Table 23. Business Rules for UAS Staffing

1	UAS operators assigned to a combat maneuver unit must be uniformed military personnel.
2	DoD civilians are not used to operate UAS.
3	"Officer equivalents'" are required for UAS operations within international airspace.
4	UAS sensor/mission payload operator positions are sourced solely with "enlisted equivalents."
5	Military officers are required for release authority of PGMs.
6	Cost of airframes and HD/LD nature of large UAS compel the use of officer pilots.

In addition to these business rules, the observations in Table 24 were identified additional discrepancies across the Services.

Table 24. UAS Staffing Observations

1	Service culture shapes how the roles and responsibilities are viewed for individual category of performers.
2	DoD-assigned missions/responsibilities and the anticipated operating environment shape how the Services view the role of their UAS.
3	The C2 concept of UAS operations (centralized vs. decentralized) and resultant authority required by aircrew relate directly to officer vs enlisted decision.
4	The Army stated the need for commissioned officer UAS career track or an additional skill identifier.
5	The Navy is the only Service that does not allow direct accessions to perform Group 4/5 pilot duties.
6	Demand for and development of UAS technology is in a period of exponential growth within the defense and commercial industries.
7	Maturation of technology will have an impact on the force presentation and staffing methodologies used within DoD's UAS enterprise.

As research continued to encounter the often emotional debate between the use of officers vs. enlisted, several aspects of this debate were considered in analyzing why the Services differed in their methodology. Distilling emotion and cultural biases from the equation, an illustrative model was used to depict the following three major aspects in deciding between officer vs. enlisted: (1) system complexity, (2) risk assumed and (3) operational environment.

Figure 19 illustrates the relationship between these events while also showing some of the attributes associated with each axis. The use of this illustrative relationship model helps to put the analysis of current Service practices and business rules into practice. While the analysis results that were discussed previously indicate that significant differences exist between Service staffing methodologies, the model in Figure 19 shows cases where such decisions are justifiable when viewed against the mission requirements of a particular Service's UAS force. While the choice to present forces using different categories of

128 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

performers is justifiable in some cases, analysis of this community highlights not only the ability to gain manpower efficiencies, but also the opportunity for increased cooperation across the Services to capitalize on lessons learned within the enterprise.

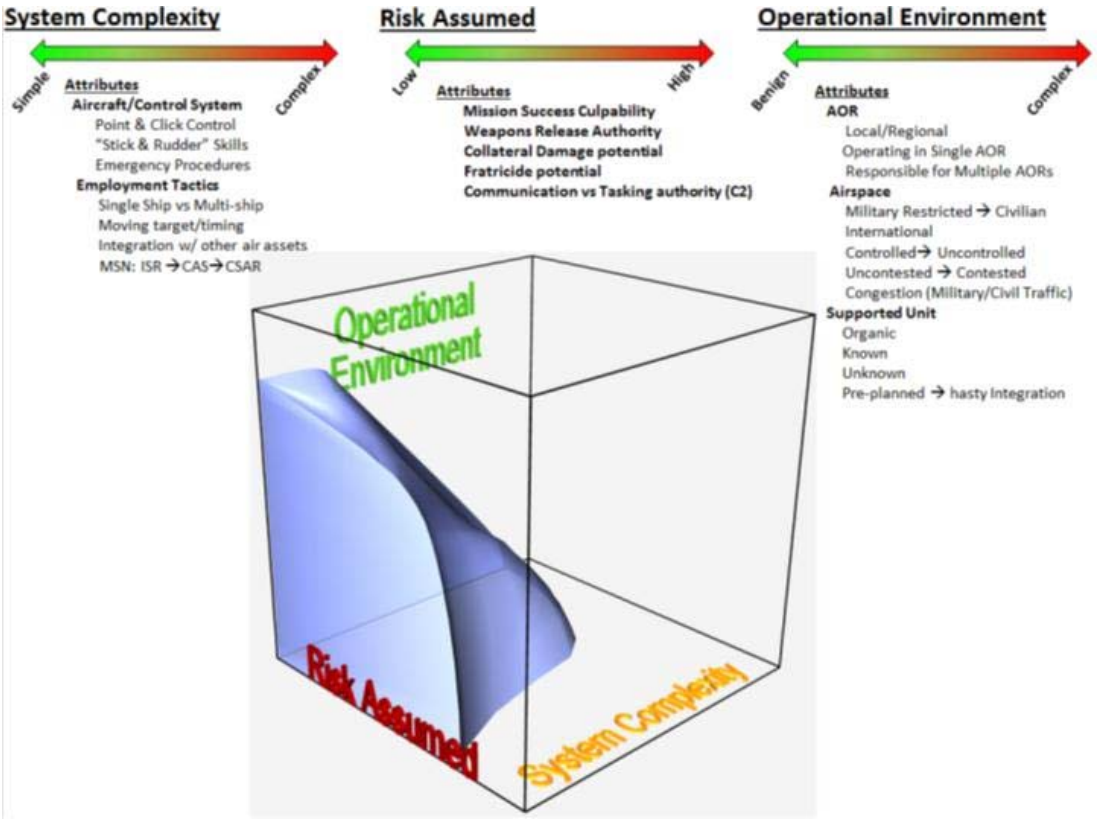

Figure 19. Complexity, Risk, and Environment Relationship

After defining business rules and identifying Service discrepancies and overall opportunities within the UAS enterprise, analysis turned to examining several workforce mix alternatives. As mentioned previously, the concept of considering government civilians as a viable option provided significant savings, especially when dedicating them to specific mission elements, such as conducting launch and recovery operations of Group 4/5 UAS. For the Air Force alone, if all of the launch and recovery assigned billets were transitioned to civilian positions, the annual savings would equate to $777,696 per LRE. Across all 15 assigned Air Force MQ-1/9 launch and recovery elements, this transition could account for an overall annual savings of approximately $11.7 million ($58.5 million over the FYDP).[174] However, it is operationally understood that an all-civilian LRE force would not meet Air Force requirements where risk, base defense requirement, and/or host

[174] Annual savings based upon FCoM numbers. See Appendix B. The $776,696 and $11.7 million totals are for full savings to the Federal Government. Savings specific to DoD are $610,776 and $9.16 million, respectively.

129 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

nation agreements require military personnel. With this in mind, Table 25 depicts a force mix alternative across the 15 USAF LREs which should meet operational requirements.[175] As seen with four all-military LREs, five 60-40, three 20-80, and three all-civilian, the total cost savings is approximately $5.1 million annually ($25.65 million across the FYDP) by transitioning approximately half (74 of 150) of the LRE positions from military to civilian.[176]

Table 25. Costing of USAF LRE Civilian/Military Force Mix

UTCs	Annual Cost/LRE		# of UTCs	Sub-total		Billets	
	DoD	Fed Gov		DoD	Fed Gov	Mil	Civ
RPA LRE UTC (All Mil)	1,283,861	1,592,561	4	5,135,444	6,370,243	40	0
LRE UTC (2 Civ + 3 Mil)	1,158,832	1,400,764	5	5,794,160	7,003,820	30	20
LRE UTC (4 Civ + 1 Mil)	804,398	979,562	3	2,413,194	2,938,686	6	24
RPA LRE UTC (All Civ)	673,085	814,865	3	2,019,255	2,444,594	0	30
Total for 15 All-Military RPA LRE UTCs				19,257,915	23,888,415		
Total for 15 Force mix RPA UTCs (as presented above)				15,362,053	18,757,343		
Delta (i.e., savings)				3,895,862	5,131,072		

Note: Delta is between mix depicted and all 15 military LREs.

In addition to launch and recovery operations, the use of civilians to support transit operations (flying UAS to and from target) was analyzed. For Air Force Group 4 RPA, it was determined that approximately 18% of each sortie was spent flying to and from the target. Allowing for schedule flexibility during 24/7/365 UAS operations, it was recommended that each Air Force operational squadron transition 1 CAPs worth of manpower to civilian positions (20 positions), understanding the same individuals can perform basic mission support up to but not including weapons employment. As Table 26 shows, approximately $1.57 million annually is saved by converting 1 CAP (20 billets) worth of manpower to DoD civilians.[177] If each of the 10 operational Air Force MQ-1/9 squadrons

[175] A full mission analysis of Air Force LRE requirements was not conducted; however, this framework is general enough to meet a majority of Air Force LRE requirements based upon Group 4/5 LRE operations that typically occur in secure locations.

[176] Ten Operational Squadrons does not include the MQ-1/9 Training squadron at Holloman AFB or the LR squadron at Cannon and Creech AFBs. Savings totals are for full savings to the Federal Government. Savings specific to DoD are $3.9 million annually and $19.48 million over the FYDP.

[177] Since no model based upon mission analysis is available for the appropriate civil/military mix, best assumptions were made with the available data. Distribution of ranks and grades throughout the squadron was kept as close in line as possible with current Air Force RPA squadron structures.

130 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

did this conversion, total program annual savings could total $13.65 million ($68.3 million across the FYDP).[178]

Although it is intuitive that manpower costs are less when using enlisted positions vs. officers, analysis explained the rationale behind this decision. However, since this discussion will undoubtedly continue, Table 26 depicts various percentages of officer-to-enlisted conversions considered for the Air Force's MQ-1/9 RPA.[179]

Table 26. Cost Comparison of USAF RPA Squadrons Using Enlisted

USAF RPA Squadron	Annual Cost		Delta (i.e., savings)	Pilot Billets	
	DoD	Fed Gov		Officer	Enlisted
All Officer	14,223,874	17,557,834	[redacted]	50	0
20% Enlisted	13,610,200	16,944,160	613,674	40	10
30% Enlisted	13,312910	16,646,870	910,964	35	15
40% Enlisted	13,000,585	16,334,545	1,223,289	30	20
50% Enlisted	12,714,217	16,048,231	1,509,603	35	25
60% Enlisted	12,401,946	15,735,906	1,821,928	20	30

Note: See Appendix B for the breakdown of positions converted. Commander (1), Operation Officer (1), and Squadron Operation Center Billets (5) are not included in enlisted conversion. In addition, the Delta is the same for the Federal Government and DoD.

While the initial cost analysis used Air Force MQ-1/9 RPA units, based on the information available, savings are also possible when applied to UAS programs in the other Services. Based on the initial cost analysis performed, it is recommended that an in-depth costing analysis be conducted that includes full life-cycle costs vs. the annual cost summary estimation provided by FCoM. Analysis should focus on using civilian manpower within the UAS workforce in support of launch and recovery operations and non-kinetic transit/ISR operations.

B. Recommendations for Further Research

In addition to identifying manpower alternatives, specifically through the use of government civilians within the UAS enterprise, the research team identified the following areas for potential future research:

---

[178] Ten Operational Squadrons does not include the MQ-1/9 Training squadron at Holloman AFB or the LR squadron at Cannon and Creech AFBs. Savings represent savings to the Federal Government. DoD savings are $10.31 million annually or $51.58 million across the FYDP.

[179] As mentioned previously, the Air Force's Staff Judge Advocate's (SJA) office has interpreted Title 10, § 8691 to state the Air Force can only use officers as rated pilots. See Armed Forces, 10 U.S.C., Volume III § 8691.

131 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

- Evaluate the accountability process to ensure that the contracts are temporary in nature where appropriate (e.g., Navy's use of contractors in support of UAS operations for over a decade).
- Evaluate staffing alternatives and potential manpower cost savings associated with the UAS maintenance force.
- Evaluate staffing alternatives and potential manpower cost savings associated with the intelligence processing, exploitation and dissemination workforce.
- Establish an Air Force WO program in terms of life-cycle costs and benefit.
- For the evolution of small UAS, determine how can/does the maturation of technology affect Service force presentation and staffing methodologies.
- Determine life-cycle costing for UAS career fields. Infancy of career field equates to a lack of data concerning life-cycle costs. Full study, to include civilian market impacts, is required to accurately estimate future government costs.
- Ensure the rapid development/acquisition of UAS systems. One unique aspect brought to UAS by SOCOM is the inherent ability for Special Operations Forces (SOF) to rapidly develop, acquire, and field emerging technologies. This capability brings dramatic changes to the entire UAS and holds the potential to change the level of support provided by smaller UAS.
- LDO career path: Open the Navy program to include UAS, create an LDO rank structure within the other Services, and/or open LDO accessions to the officer corps.
- Investigate potential efficiencies (manpower, resources, cost, and acquisition timelines) associated with consolidating similar Group 4/5 UAS platforms under a single service (i.e., MQ-1 and/or RQ-4 variants). Research should focus on consolidating platforms under a single Service or managing and operating platforms in more integrated manner. This approach may include everything from acquisition parity/interoperability standards to more radical ideas such as creating joint operational squadrons.

This page is intentionally blank.

Appendix A
Statutory Guidance Supporting Data

The following information provides the additional analysis information supporting Chapter 3.

A. Title 10 Foundation

Each Fiscal Year (FY), Congress approves the Department of Defense (DoD) budget, which defines the individual Services' authorized strength. U.S.C. Title 10 (hereafter referred to as Title 10) defines authorized strength as "the largest number of members authorized to be in an armed force."[1] Services are subsequently responsible for the application of that authorized strength across their respective core missions. Although Title 10 outlines specific requirements in terms of generic missions (armor, infantry, strategic airlift, and so forth), it does not direct any one Service to specifically maintain an Unmanned Aircraft System (UAS) capability.[2] Also, Title 10 does not direct a specific category of performer to conduct UAS operations.[3] Since budgetary constraints and mission requirements cause potentially large fluctuations in overall end strength and functional/technical component requirements, the following summary focuses on generic force mix statutory requirements rather than specific numbers or percentages of end strength, neither of which is specifically dictated by congressional and/or DoD statutory guidance.

While the authorized strength is defined by Service FY budgets, in accordance with Title 10, the Secretary of Defense is responsible for annually prescribing the total authorized active duty commissioned officers within each of the armed forces.[4] While Title 10 provides a table outlying the authorized force mix of field grade (O-4 to O-6) officers based upon overall officers allotted, the Service chiefs prescribe the strength of the individual

---

1 Armed Forces, 10 U.S.C., Volume I § 101(b)(11) (Washington, DC: U.S. Government Printing Office, July 2011), http://armedservices.house.gov/index.cfm/files/serve?File_id=7C199E0E-1614-497F-A818-B5D5B4BF33B5. The definition also includes "a component, a branch, a grade, or any other category of the armed forces," but the truncated definition suffices for this discussion.

2 Example: Title 10, Volume III § 3062 and § 8062 outline Congress' intent for the Army and Air Force, respectively, and, in some cases, outline generic structure (e.g., Army branches). However, it does not dictate UA program. See Armed Forces, 10 U.S.C., Volume III § 3062 and § 8062 (Washington, DC: U.S. Government Printing Office, July 2011), http://armedservices.house.gov/index.cfm/files/serve?File_id=FC0173D5-F7D3-4D74-8D42-1B9E185B7C6B

3 For example Title 10 § 8067 dictates that Medical, Judge Advocate, and Chaplain services be performed by officers. There is no such designation for UA programs or even for pilots in general. See Armed Forces, 10 U.S.C., Volume III § 8067.

4 Armed Forces, 10 U.S.C., Volume I § 521.

134 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

category of active duty officers within their Service.[5] However, this allocation of personnel is kept at the Service level and is not prescribed across any singular mission set or functional capability (i.e., no percentage of force/rank is directed to support UAS programs).

B. Category of Performer Determination

Department of Defense Directive (DoDD) 1100.4[6] is based upon accomplishing national military objectives with a "minimum manpower that is organized and employed to provide maximum effectiveness ….[7] It further lists flexibility, adaptability and "responsive[ness] to crisis situations and new management strategies"[8] as further guiding principles. Programs must also be supported by long-range strategies that implement Doctrine, Organization, Training, Materiel, Leadership and Education, Personnel, Facilities (DOTMLPF) policy changes while still maintaining a ready force. In determining the appropriate manpower requirements, the following points summarize DoDD 1100.4 guidance:[9]

Functions that are inherently governmental shall not be contracted.

- Manpower management shall be **flexible, adaptive** to program changes, and **responsive to crisis situations** and new management strategies.
- Enable development of **combat-related skills** or to promote career development in military competencies.
- National military objectives shall be accomplished with a **minimum of manpower** that is organized and employed to provide **maximum effectiveness and combat power**.
- Assigned missions shall be accomplished using the **least costly mix of personnel** (military, civilian, and contract) consistent with military requirements.
- **Consider all available sources** when determining manpower mix to include the **Active and Reserve** military, **civilian** manpower; **intra-governmental, contract,** and host-nation support.

---

5 Armed Forces, 10 U.S.C., Volume I § 523

6 Department of Defense, "Guidance for Manpower Management," DoDD 1100.4 (Washington, DC: USD(P&R), February 12, 2005), http://www.dtic.mil/whs/directives/corres/pdf/110004p.pdf.

7 Ibid., 2.

8 Ibid.

9 Ibid. Guiding principles are a synopsis of Section 3.2 and those that are found relevant to this study (emphasis added).

135 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

- **Manpower shall be designated as civilian except when military incumbency is required** for reasons of law, command and control of crisis situations, combat readiness, or esprit de corps; when unusual working conditions are not conducive to civilian employment; or when military-unique knowledge and skills are required for successful performance of the duties.[10]
- Sufficient manpower positions shall be **designated as civilian to develop competencies and skills that may not be taught or recruited directly from the private sector**.
- Manpower authorities shall designate **sufficient manpower to provide a rotation base** for military personnel.

While this relatively generic guidance dictates that force management strategies are appropriately driven by mission requirements and associated manpower costs (both addressed later in the analysis), DoDI 1100.22, "Policy and Procedures for Determining Workforce Mix," builds upon this direction and further outlines the delineation of manpower between uniformed military and civilian:[11]

Manpower shall be designated as civilian except when on or more of the following conditions apply:

- Military-unique knowledge and skills are required for performance of the duties.
- Military incumbency is required by law, E.o. [*sic* E.O.], treaty, or IA [international agreement].
- Military performance is required for command and control, risk mitigation, or esprit de corps.[12]
- Military manpower is needed to provide for overseas and sea-to-shore rotation, career development, or wartime assignments.
- Unusual working conditions or costs are not conducive to civilian employment.

These five principles provide a relatively simple outline for the delineation between uniformed military and DoD civilian, although the associated threshold for each remains

[10] Exemption for "esprit de corps" is further defined in Department of Defense Instruction (DoDI) 1100.2. It provides examples such as military bands, honor guards, Navy Blue Angels, military recruiters, and so forth. See Department of Defense, "Policy and Procedures for Determining Workforce Mix," DoDI 1100.22 (Washington, DC: USD(P&R), April 12, 2010), 37–38, http://www.dtic.mil/whs/directives/corres/pdf/110022p.pdf.

[12] See Footnote 10.

136 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

open to a wide set of interpretations. Analysis within this paper analyzes these thresholds against current Service missions and associated practices.

C. Inherently Governmental (IG)

Within DoDI 1100.22, the following table (Table A-1) is provided as an overview to assist DoD manpower analysts in making the appropriate determination. The term "exemption" is used throughout the table and subsequent discussion as that manpower that is exempted from private sector performance and is therefore IG.

Table A-1. Manpower Mix Criteria

A	Direction and Control of Combat and Crisis Situations		
B	Exemption of Combat Support and Combat Service Support due to Operational Risk		
D	Exemption of Manpower Dual-Tasked For Wartime Assignments		
E	DoD Civilian Authority Direction & Control	F	Military-Unique Knowledge & Skills
G	Exemption for Esprit de Corps		
H	Exemption for Continuity of Infrastructure Operations	I	Military Augmentation of the Infrastructure During War
J	Exemption for Civilian & Military Rotation	K	Exemption for Civilian & Military Career Development
L	Exemption by Law, Executive Order, Treaty or International Agreement		
M	Exempted by DoD Management Decision		
P	Pending Restructuring of Commercial Activities		
R	Subject to Review for Public-Private Competition		
W	Non-Packageable Commercial Activity		
X	Alternative to Public-Private Competition

137 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

While this paper will not revisit the entire breakdown of the associated criteria, a synopsis of five pertinent criteria is provided to aid in future analysis.[13]

- **Direction and Control of Combat and Crisis Situations**. The following are aspects of these criteria that are all IG.
  - Command of military forces.
  - Operational control of combat, combat support, and combat service support units. Unlike civilians, military personnel must obey all lawful orders at all times and cannot quit or abandon their duties. Although civilians supporting combat operations may find themselves subject to the Uniform Code of Military Justice (UCMJ), only a military commanding officer can exercise that authority.
  - [Conduct of] combat operations. Not only is this criteria IG, but it must also be conducted by designated military forces (i.e., not DoD civilians). "When armed fighting or use of force is deemed necessary for national defense, the Department of Defense may authorize deliberate destructive and/or disruptive action …"[14] with the intent to destroy a hostile force or other military objective by means of employing "firepower and other destructive and disruptive capabilities."[15] Combat is also IG because we must hold military commanders and their forces "*accountable* for the appropriate and controlled use of combat power and adherence to rules of engagement and the law of war."[16] It is also crucial that military commanders execute "*discretionary judgment, leadership, knowledge, and discipline* necessary to perform effectively and responsibly *under fire.*"[17]

[13] Enclosure 4 of DoDI 1100.22 provides an in-depth review of all the criteria listed in Table A-1.

[14] Department of Defense, "Policy and Procedures for Determining Workforce Mix," DoDI 1100.22, 18.

[15] Ibid.

[16] Ibid., (emphasis added).

[17] Ibid., 19 (emphasis added).

138 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

The description of this IG criterion states specifically that

> … manpower shall be designated military … if the *planned use of destructive combat capabilities is part of the mission* assigned to this manpower …. This includes manpower located both *inside and outside a theater of operations* if the personnel operate a weapon system against an enemy or hostile force (e.g., bomber crews, intercontinental ballistic missile crews, and *unmanned aerial vehicle operators*). This does not include technical advice on the operation of weapon systems or other support of non-discretionary nature performed in direct support of combat operations.[18]

– Security in hostile or volatile areas. Some security operations can be considered commercial; however, in general, if the security is provided for operations in "uncontrolled, unpredictable, unstable, high risk, or hostile environments" that function is considered IG.[19] The guidance further states that if there is a "*high likelihood of hostile fire, bombings, biological or chemical attacks*"[20] and the discretionary use of deadly force is expected, private security contractors are not authorized because this is an IG operation.[21] This section also includes operations that entail assisting, reinforcing or rescuing military and/or private security contractors.[22] Also, the security support is IG if "an offensive response to hostile acts or demonstrated hostile intentions would be required to operate in, or move resources through, a hostile area of operation."[23] The instruction further discusses the discretion during operations and when it drives IG operations. Manpower should be IG if "decisions on the appropriate course of action would require substantial discretion, the *outcome of which could significantly affect U.S. objectives* with regard to the life, liberty, or property of private persons, *a military mission*, or *international relations*."[24]

  Finally, this subsection of combat does address the role of contractors within combat support roles and the difference between self-defense and IG offensive operations. It provides the example that support organizations within a

[24] Ibid., (emphasis added).

139 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

fielded military organization—Marines in this case—have an IG function because they must be armed and are expected to conduct offensive operations at any moment when attacked. However, as stated within the instruction, "if a military Service has a *new weapon system* available for use during hostilities, but *sufficient numbers of military maintainers are not yet trained*, the commander might be able to use contract maintenance in a *secure compound* without degrading the operational capability of the system. In such cases, only the IG security forces at the compound are coded [IG]. However, in such cases, contractor personnel may be issued weapons for self-defense."[25]

- **Exemption of CS [Combat Support] and CSS [Combat Service] Support due to Operational Risk.** This criterion expands on some of the combat criteria discussed previously. Support activities are considered IG if, in the judgment of the commander, any of the following are true:
  - Threat level could increase and military personnel would be needed on short notice to provide or augment a military capability.[26]
  - There would be an unsafe number of personnel in hostile area who are not combatants.[27]
  - DoD civilians or private sector contractors will not or cannot continue to perform their work. Includes, but is not limited to, work stoppage due to increased threat level, duration of hostilities, and/or a change in host nation support agreements. Also includes commander's discretion if "there is too great a risk that a contractor would default or not comply with the rules on the use of force."[28]
  - **There is too great a risk that an encounter with an enemy or hostile force would lead to hostilities** and necessitate assistance, reinforcement or rescue.[29]
  - DoD civilians will conduct IG work typically thought of as a commercial activity if their position is "**E-E [emergency-essential]** manpower that provides continuity of operations for essential functions, maintains the availability of combat-essential systems or performs duties critical to combat

operations in overseas locations during a crisis when other civilians are evacuated."[30] These positions are IG when they cannot be vacated or eliminated during a mobilization or other national emergency without seriously impairing the ability of the activity to function effectively. Examples include "supply and maintenance of strategic weapons system … [and] logistical support elements that deploy to hostile areas."[31]

- **Exemption of manpower dual-tasked for wartime assignments.** This criterion is summarized as those functions conducted during peacetime that could easily be accomplished by the commercial sector. However, in the event of a contingency, that function/position is required to mobilize and conduct an IG function (typically those described previously).[32]
- **DoD civilian authority, direction, and control.** This criterion focuses on functions that, although conducted by civilians, are directly and ultimately accountable for accomplishment of missions and/or discretionary exercise of DoD authority.[33] It also includes the IG requirement for those positions where "Defense officials require the incumbent's judgment and insight to make informed decisions and preclude sole reliance on contract advisory assistance."[34]
- **Military-unique knowledge and skills.** This criterion includes manpower that "directs and controls intelligence and counterintelligence operations."[35]

D. Risk Assessment and Determining IG Activities

While the criteria listed in Chapter 3 provide a strong framework for deciding what is and what is not IG, many of these criteria can be contested when discussing UAS operations, especially with today's fiscally constrained environment. As such, the integration of risk analyses is critical to the process. DoDI 1100.22 states that when addressing contractual obligations, risk should be considered "to preclude ceding governmental control and authority of IG functions to the private sector where there is insufficient public **accountability and transparency**."[36] It also discusses analyzing the **operational/ logistical "footprint**" associated with various workforce mix solutions as an overly large

141 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

footprint could limit flexibility and introduce an unacceptable level of risk.[37] In addition to these considerations, the following key points summarize the risk factors associated with analyzing risk associated with the command and control of possible workforce mix options:

- **Readiness reporting.** Commanders must have visibility of the readiness of critical support elements to judge the readiness of the military force to conduct and/or sustain military operations. The instruction (DoDI 1100.22) recommends analyzing historical records/studies to indicate whether contractors or DoD emergency-essential employees "perform satisfactorily under environmental conditions, threat levels and for the length of time required.[38]"
- **Replacing lost support.** This loss may be due to combat loss (for this study, an aircraft and/or operator) and/or contractual failure to support. Planners must determine whether alternate sources of support can be obtained in-house or from an alternate private sector provider in the time required for operations.[39]
- **Continuity of operations during hostilities**. Can a contractor sustain operations during hostilities and adjust to situations in which employees are killed or injured, equipment is damaged or destroyed equipment, employees have to be rotated during protracted conflict, and so forth?[40]
- **Operational control in hostile environments**. This factor is closely related to the criteria described under "Exemption of CS and CSS Support due to Operational Risk." In this section, the instruction raises several key points focused on individual/unit performance once attacked and/or involved in hostilities. In first addressing the risk of non-performance, it highlights that although contractors and DoD civilians fall under the UCMJ during war or qualifying contingency operations, the articles dealing with desertion and absence without leave apply specifically to "a member of the armed force"[41] and likely do not apply to civilians. Therefore, the instruction points out that "DoD civilian and DoD contractor employees arguably may quit their jobs or not perform their duties without risk of criminal prosecution under the UCMJ."[42] It also points out that misbehavior before the enemy also only applies to a uniformed military member. This misbehavior includes things such as "running away and cowardly conduct in the

142 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

presence of the enemy and not affording all practicable relief and assistance to other troops when engaged in battle."[43]

This portion of the risk assessment also addresses the need for a military commander to have direct control and unconstrained access/use of all personnel to reconstitute essential support functions after an attack. The need for flexibility and responsiveness is paramount during these situations.

> Commanders often cannot compel DoD civilians or contractor employees to perform work or assume risks that were not agreed upon under the terms of their employment or covered in the terms of the contract. In emergency situations, a military commander may direct DoD civilians to take lawful actions. However, a military commander may only direct contractor employees to take lawful actions so long as those actions do not require them to assume IG responsibilities and the actions are covered by the terms of the contract.[44]

This same consideration is similar when looking at the responsiveness required by military commanders during times of conflict. Since contractor employees do not fall under the direct supervision of the military commander, a contracting officer serves as the liaison between the commander and the contract employee's employer, who is ultimately responsible for that employee's performance. These added layers and separate "contractual lines of authority could hamper or overly complicate the commander's control and constitute an inappropriate risk."[45]

- **Discipline authority.** As mentioned previously, during a declared war or qualifying contingency operation, contractors may fall under UCMJ jurisdiction; however, limits related to the overall guidance associated with the implementation of that jurisdiction "could overly complicate operations in high-risk situations."[46] These limits can also present challenges in the case where a contractor force may not be held to the same level of professionalism one desires by a force conducting operations in a foreign sovereign nation, which could entail everything from lewd contact to disrespect of another's culture.
- **Restrictions due to laws and IAs.** While IAs, such as a Status of Forces Agreement, will often dictate the jurisdiction and interactions concerning military and civilian personnel, there may be situations where these guidelines do not exist or

[43] Ibid.

[44] Ibid., 50–51.

[45] Ibid., 51.

[46] Ibid.

143 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

do not cover all situations applicable. In these cases, civilians may find themselves subject to the host nations laws and jurisdiction. An additional consideration for the use of civilians is the Law of War. Civilians authorized to operate with armed forces may be captured. This capture is not a violation of the Law of War, and they are entitled prisoner of war (POW) status. They may also be armed to provide self-defense; however, they can then also be targeted in the event they are taking a direct part in hostile activities.[47]

E. Kinetic Weapons Employment Notes

Although this paper limits the discussion of UAS weapons employment to those that are offensive in nature, it does not negate the use of offensive firepower under "self-defense" Rules of Engagement (ROE) (i.e., employing weapons from an UAS in support of another force currently under, or impending, attack). However, this paper contends that when employing weapons under such conditions (i.e., Self-Defense (of others) ROE), this situation is an offensive employment and requires military personnel. This paper does not consider self-defense of the UAS itself (i.e., employing weapons on a surface to air threat) justification for a non-military crewmember to employ weapons.[48] In addition, when discussing weapons employment, this paper refers to those weapons that are kinetic in nature (i.e., depart the UA (examples: AGM-114 "Hellfire" missile or GBU-12 laser-guided bomb)). For this paper, the employment of kinetic weapons also includes providing terminal guidance for said weapons. For example, a UA that provides the laser energy to guides a weapon(s) to the intended target would be conducting kinetic weapons operations. As technology and UAS capabilities increase, the use of the UAS itself, typically a smaller UA, as a weapon is also feasible. Such an employment is also included as "kinetic" in this discussion.[49]

Historically, the scope of who is considered "involved" in such kinetic operations has also been debated. This paper limits the scope to the physical act of commanding (i.e., "squeezing the trigger") the following: (1) release of the weapon(s) and/or (2) terminal

---

[47] Ibid.

[48] This legal concept is one that can be debated and one on which additional research can be executed. This paper recommends that if an unmanned aircraft (UA) is operating within a threat, or anticipated threat, where Self Defense ROE against a surface to air threat is possible, the appropriate crew manning for such a mission is military, thereby removing the necessity of swapping crews for employment. Such a swap is likely ill-timed and can create additional operational confusion.

[49] This paper does not address any "non-kinetic" weapons employed in various forms of electronic warfare (EW), electronic attack (EA) and/or computer network attack (CNA). ROE for these operations should follow those established for similar operations. For example, if a CNA capability is somehow employed from, and by, an UA crew, the determination for category of performer should mirror that of the Cyber community. In addition, the issue of non-uniformed military/DoD civilian UAS crew/operators passing coordinates, information and/or a target description that would enable a subsequent strike(s) is also not addressed since it is beyond the scope of this paper.

144 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

guidance (e.g., firing laser energy). Also included is the Aircraft Commander during such operations (if/when this individual is different from the person squeezing the trigger). Supporting positions outside of these functions, such as those who provide intelligence for the strike, remain under the policies and practices of those respective functions and career fields.

While the statutory guidance outlined in DoDI 1100.22 is quite clear about military incumbency required to "operate a weapon system against an enemy or hostile force,"[50] the following concept was used by researchers to further amplify and clarify the role of kinetic weapons employment and terminal guidance (as discussed in Chapter 3):[51]

> Uniformed military personnel are required for all UAS operations which include the employment of, and/or provide terminal guidance to, kinetic weapons. Military incumbency is also required for those operations where the UAS crew is in direct support of forces that face the potential of, or are directly engaged in, armed hostilities.

This concept highlights the importance that the Services place on the military incumbency required when UAS crews are directly supporting forces engaged in, or face the near-term potential of, hostilities. It is derived from the belief that the decisions and contributions made by the UAS crew in the act of such support, whether their aircraft is armed or not, have a great influence on the outcome and likely survival of those supported forces (e.g., UAS aircrew informing ground forces which direction suspected enemy fire is coming from). As such, this type of operation not only represents the "exercise of substantial discretion when applying Federal Government authority"[52] as defined by DoDI 1100.22 for IG activities, but is also so inherently a part of combat operations that it drives the requirement further to one of military incumbency

F. UAS Force Mix Principles and Definitions Derived

1. Hierarchy of Performers

Statutory guidance makes it clear that IG functions cannot be contracted and that DoD civilians cannot function in roles where military incumbency is required. Through this same guidance, it is implied that there is a hierarchy of the manpower categories of performers. While DoD civilian employees are the preferred solution when appropriate for

[51] Ibid.

[52] Ibid., 13.

145 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

non-warfighting Combatant Command requests for forces,[53] if it is appropriate for a DoD civilian, a military member can also fill that role. Conversely, if the function is IG, it cannot be filled by a contracted manpower. Those roles that are appropriate for a contractor can be filled by either a DoD civilian or uniformed military member; however, those functions that require military incumbency can by definition only be fulfilled by uniformed military personnel.

2. Mission-Focused IG Criteria

In determining whether DoD UAS operations are IG, we look specifically at the mission-focused criteria, pertinent to this paper, as listed in Chapter 3:

Key Mission Focused Criteria for IG Determination

- Command of military forces
- Operational control of combat, combat support, and combat service support units
- Conduct of combat operations
- Peacetime commercial function that, in the event of a contingency, is required to mobilize and conduct an IG function
- Ultimately accountable for accomplishment of missions and/or discretionary exercise of DoD authority
- Military-unique knowledge and skills

Focusing specifically on these key mission elements, the first element is rather straightforward: if a position is responsible for the command of military positions, then it also must be military. The next two elements require a definition of the term "combat" in the context of a UAS program. While the employment of weapons from a UA is easily seen as combat, a few specific points require attention. For example, if a UA is armed but there is no possibility of it engaging in weapons employment, does it have to be operated by the military? If a UAS is flown remotely from the Continental United States (CONUS) but is watching ground/naval troops engage in armed conflict on foreign soil/water, does that cross the threshold for "combat ops" in determining whether the mission is IG? Does the determination change if the UAS is simply collecting intelligence and no U.S. or allied ground/naval forces are present? This paper contends that there is a difference, and, while there will always be an element of "it depends," the following definition is provided to clarify the issue in future analysis. In defining combat for associated UAS programs, it was

[53] Department of Defense, "DoD Civilian Expeditionary Workforce," DoDD 1404.10 (Washington, DC: USD(P&R), 29 January 2009), 3, http://www.dtic.mil/whs/directives/corres/pdf/140410p.pdf.

146 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

found this issue was closely tied to the criteria associated with the discretionary exercise of DoD authority. A UAS tasked on a relatively benign mission of collecting video and/or signals intelligence is, in the view of this paper, vastly different from a UAS responsible for the integration with and successful completion of a ground/ naval unit engaged in hostilities. While no specific statutory guidance "spells it out," this paper contends that if U.S. (or allies) forces involved in hostilities are directly supported by UAS, the intent of the statutory guidance is to have that responsibility for mission success in the hands of the U.S. government. Therefore, it is an IG function.

> **UAS Combat.** UAS program activities are considered combat related if there is a possibility that the UAS crew member will be responsible for the employment of kinetic weapons.[54] Also included are operations where the UAS crews are in direct support of forces that face the potential of, or are directly engaged in, armed hostilities.

Therefore, in terms of IG criteria, combat-related operations and/or positions responsible for the operational control of units conducting such operations must be IG.

Turning back to the original questions posed about combat and weapons employment, it was also determined that operating a UA with weapons on board and the actual employment of those weapons are different. Comparing the operation of an armed UA with the transportation of ammunition, the dividing line between IG and non-IG comes in the physical employment of said weapons. As future analysis will show, this delineation is important when looking specifically at the larger UAS launch and recovery operations.

The final two mission-focused criteria are the most subjective. These criteria are easily debated and require full analysis when looking at alternatives. For example, is the launch and recovery of a UAS a "military-unique" skill? Since several civilian companies are now operating UAS, one could easily assess this as "no, it is not IG." However, one could also assess that although operating a UAS is a commercial skill set, it is also one required to mobilize in the event of a contingency.[55] The decision then focuses on whether the mobilized mission constitutes an IG activity. Once again, it depends. In analyzing

---

[54] As mentioned previously, this paper limits the scope of employing weapons to the physical act of commanding (i.e., "squeezing the trigger") the following: (1) release of the weapon(s) and/or (2) terminal guidance (e.g., firing laser energy). Also included is the Aircraft Commander during such operations (if/when individual is different from the person "squeezing the trigger"). Supporting positions outside these functions, such as those who provide intelligence for the strike, remain under the policies and practices of those respective functions and career fields.

[55] In the event that the UAS operated at the launch and recovery element requires the crew to employ weapons in an offensive posture, the function would indeed become IG.

147 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

alternatives, this paper has used these two criteria. However, doing so has not provided a clear black and white line, but rather shows that alternatives must be analyzed based on the mission requirements and potential operational environment.

14. ABSTRACT

The purpose of this study is to identify alternative staffing strategies to accomplish the Department of Defense's (DoD) Unmanned Aircraft System (UAS)-related missions in a more cost-effective fashion. Research aimed at analyzing DoD's mission requirements along with the individual Service's approach to UAS staffing. Mission analysis identified various "business rules" applied across the DoD along with opportunities for cost savings. One of the most notable of these savings came from the use of a balanced workforce comprise of both uniformed military and government civilian. Specific opportunities rest within the larger unmanned aircraft systems where the AF alone could save a potential of approximately $94M across the FYDP by simply utilizing government civilians to appropriate mission elements. Analysis also reviewed the often emotional debate between the use of officers vs enlisted pilots and developed a model to depict three major elements for decision makers, 1) System Complexity, 2) Risk Assumed and 3) Operational Environment. While the Services' staffing choices are in some cases justifiable, analysis highlighted trade space to gain manpower efficiencies and increased Service cooperation. While this report offers an initial cost analysis, a full scale costing analysis for this burgeoning career field is recommended.

Mission and Description

Airborne & Maritime/Fixed Station Joint Tactical Radio System (AMF JTRS) products are software programmable, multi-band, multi-mode, mobile ad hoc networking radios, providing simultaneous voice and data communications for Army aviation platforms. The radios will operate in networks supporting the Common Operational Picture, situational awareness, and interoperability of Mission Command systems throughout the battlefield. AMF must ensure the soldier's ability to communicate both horizontally and vertically via voice and data within all mission areas and Combat Operational Environments. AMF helps close capability gaps by extending data networking to company echelons and below, enabling network services to the platform, and connecting Army aviation platforms to Army ground and Joint air network domains.

AMF will procure the Small Airborne Networking Radio (SANR) as a Non-Developmental Item. The SANR is a two-channel, software-defined, National Security Agency Type 1 certified networking radio providing seamless real-time information for operation in mobile and dynamic combat environments that will meet tactical communications requirements as validated by the Army aviation community. SANR will provide increased data throughput to Army aviation platforms via the Soldier Radio Waveform (SRW) and Wideband Networking Waveform (WNW) capabilities, and maintain Single Channel Ground and Airborne Radio System (SINCGARS) capability. SANR will replace the current SINCGARS radios on Army aviation platforms. SANR is planned for implementation on the following platforms: Apache (AH-64E), Black Hawk (UH-60V, UH-60M, HH-60M, and MH-60M), Chinook (CH-47F and MH-47G), Gray Eagle Unmanned Aircraft System (MQ-1C), and Little Bird (MH-6) aircraft. SANR will enhance and further enable the ability of the maneuver commander to integrate and synchronize aviation forces with land based operational forces. SANR, employed on Army aviation platforms, will enable aviation combat elements (Combat Aviation Brigades, Theater Aviation Brigades, and Special Operations Aviation Regiment) to better utilize the inherent versatility of airborne communications as a complement to the unique capabilities of the other combat arms. SANR will give commanders enhanced situational awareness and mission command in a package that provides a more responsive means of directing aircraft to match changing maneuver forces situations and missions.

The fielding of SANR will follow the deployment of ground network capabilities. The SANR radio will provide SRW, SINCGARS and the WNW capability to all Army tactical aircraft (reconnaissance, attack, cargo, and utility).

337 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

Executive Summary

General:

The objective of the AMF JTRS program is to purchase Non-Developmental Item production-ready radios capable of operating network and legacy waveforms for Army aviation platforms. The acquisition approach will leverage prior industry and Government investment in software-defined radios to meet stated user requirements.

The Small Airborne Networking Radio (SANR) will be a two-channel radio that will run the Single Channel Ground and Airborne Radio System waveform, Soldier Radio Waveform, and Wideband Networking Waveform to interoperate with ground forces and maintain connectivity for combat operations. The SANR subprogram is designated an ACAT ID.

SANR:

As reported in the September 2015 Exception SAR, the addition of sunk RDT&E costs to the SANR subprogram, as a result of the August 2015 ADM that directed close out of the Small Airborne Link 16 Terminal subprogram, triggered a threshold breach of the APB SANR RDT&E objective. A Program Deviation Report was submitted in January 2016 as formal notification that a threshold breach to the APB occurred.

SANR acquisition activities resumed in FY 2016. These activities include market research, development and release of the request for proposal, along with preparation for, and start of, source selection activities in support of contract award.

An update to the AMF JTRS APB is under review. The APB will be finalized upon approval of the SANR CPD.

There are no significant software-related issues with this program at this time.

[1] *APB Breach*

Current APB Cost Estimate Reference

Program Office Estimate aligned with FY 2015 President's Budget dated March 04, 2014

Confidence Level

Confidence Level of cost estimate for current APB: 50%

Original APB cost estimate was established by OSD decision at 50% confidence level.

Cost Notes

Costs do not reflect funding for platform integration and installation. Army requirements by platform and year, including integration and installation of Small Airborne Networking Radios (SANR) on host platforms, are documented separately.

344 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

Total Quantity			
Quantity	**SAR Baseline Development Estimate**	**Current APB Development**	**Current Estimate**
RDT&E	204	192	162
Procurement	24920	14060	14060
Total	25124	14252	14222

Quantity Notes

The fielding plan and procurement funding are based on current Army requirements of 7,030 SANR (14,060 channels).

RDT&E quantity of 81 units (162 channels) reflect planned deliveries to the Army for integration onto platforms. This quantity does not include 19 units (38 channels) required for testing.

AMF PAUC and APUC units of measure are per channel. Quantities are channels with the assumption of two channels per radio.

PB 2017 Total	1419.8	6.2	5.0	35.9	47.8	75.0	92.3	1811.4	3493.4
PB 2016 Total	1293.6	6.2	10.4	35.4	48.5	86.9	163.2	1735.3	3379.5
Delta	126.2	0.0	-5.4	0.5	-0.7	-11.9	-70.9	76.1	113.9

Funding Notes

Starting in FY 2014, all AMF RDT&E funding resides in Army PE 0605380A.

The Prior delta of +$126.2M between PB 2016 Total and the PB 2017 Total is comprised of +$129.9M and -$3.7M where $129.9M is due to the movement of sunk cost associated with AMF acquisition program from SALT to SANR. This amount is offset by a prior year adjustment -$3.7M in the Navy account.

Operating and Support Cost

Cost Estimate Details

Date of Estimate: December 30, 2015
Source of Estimate: POE
Quantity to Sustain: 14060
Unit of Measure: Channels
Service Life per Unit: 20.00 Years
Fiscal Years in Service: FY 2020 - FY 2052

O&S costs are based on the procurement of 7,030 two-channel radios (7,030 x 2 = 14,060), each with a 20-year estimated service life. RDT&E quantities are not sustained.

Sustainment Strategy

The project is currently in the pre-solicitation stage. The program office will conduct an in-depth assessment of risks to logistics and training as information on the product becomes available. The program office will execute a step approach to contracting for a Performance Based Logistics (PBL) solution to be initiated after the FRP decision. Initial procurement of test/integration units is planned to come with a one-year warranty and Interim Contractor Logistics Support at contract award. The program office plans to conduct a business case analysis using actual cost, usage, and turn-around times before FRP. This approach will facilitate transition to full PBL implementation with greater understanding of requirements, more effective metrics, and greater cost fidelity. Depot Source of Repair Analysis will also be conducted prior to Milestone C. The training concept is being jointly developed by the PEO for Command, Control, and Communications - Tactical, PM Tactical Radios, PM AMF, the Army Training and Doctrine Command Training Directorate and the U.S. Army Aviation Center of Excellence, and will include a System Training Plan to accompany the validated requirements document.

Antecedent Information

No Antecedent. AMF radios are software programmable, multi-band, multi-mode, mobile ad hoc networking radios, providing simultaneous voice, data, and video communications, and which may be employed in new and innovative ways as compared to any currently fielded legacy radio.

371 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

Mission and Description

The MQ-1C Gray Eagle Unmanned Aircraft System (MQ-1C Gray Eagle) provides the Division Commander a dedicated, assured, multi-mission unmanned aircraft system for the tactical fight assigned to the Combat Aviation Brigade (CAB) in each Division and supports the Division Fires, Battlefield Surveillance Brigades, and Brigade Combat Teams based upon the Division Commander's priorities. Additionally, MQ-1C Gray Eagle provides reconnaissance, surveillance, and target acquisition; command and control; communications relay; signals intelligence; electronic warfare; attack; detection of weapons of mass destruction; battle damage assessment; and manned-unmanned teaming capabilities. Fifteen Gray Eagle Warfighting companies are assigned as follows: ten companies assigned to Army divisions, one company to the National Training Center (NTC), one company to the U.S. Army Special Operations Command (USASOC), and three companies to the Intelligence and Security Command (INSCOM).

Version 8.7, Revision 3 of the CPD for MQ-1C Gray Eagle defines an operational requirement for Improved Gray Eagle (IGE). IGE provides for increased range, endurance, and payload carrying capability for Echelons Above Division. IGE provides the Army with an extended range, multi-purpose unmanned aircraft system capable of executing reconnaissance, security, attack, and intelligence collection missions in the range of military operations. Sensors/payloads include an Electro -Optical/Infrared/Laser Designator, Synthetic Aperture Radar/Moving Target Indicator, Signals Intelligence, and Hellfire missiles; providing a near all-weather mission capability. When integrated with manned systems, manned-unmanned teaming, IGE enhances the capability to provide more accurate and timely information and intelligence, and significantly reduces the time to conduct tactical engagements. A total of 36 of the 167 MQ-1C UAS aircraft will be delivered in the IGE configuration.

A Gray Eagle Company is configured into three equal platoons. The Gray Eagle System consists of 12 MQ-1C aircraft, each with the following payloads: Electro-Optical/Infrared, Laser Range Finder/Laser Designator, Synthetic Aperture Radar/Ground Moving Target Indicator, communications relay, and Hellfire Missiles. Ground equipment includes: six Ground Control Stations (GCS), seven Ground Data Terminals, three satellite communication Ground Data Terminals, one Mobile GCS, the Automated Takeoff and Landing System which consists of six Tactical Automatic Landing System-Tracking Subsystems, two per runway, and Ground-Based Sense and Avoid. USASOC and INSCOM companies will contain the full complement of system equipment. However, the Divisional and NTC companies will have fewer assets while at Continental United States (CONUS) locations. These units will have nine aircraft and five GCS with corresponding support equipment. When deployed outside CONUS, the Army will reallocate equipment from other units which will bring these companies to full Gray Eagle System equipment strength. Each Gray Eagle company will consist of 125 soldiers within the Divisional CAB and the NTC. Each unit will have three identical platoons; each platoon is capable of operating independently when fully equipped.

MQ-1C Gray Eagle is fielded across tactical and operational elements: the CAB in support of Army divisions, the 116th Military Intelligence Brigade (also known as the Aerial Intelligence Brigade) in support of the Army INSCOM, and the 160th Special Operations Aviation Regiment (Airborne) in support of USASOC. All three organizations utilize the balanced platoon configuration, providing for three identical flight platoons within the company. This configuration provides increased employment flexibility to the commander (consolidated, split-based, or remote split-based operations) and increased operational tempo over previous configurations with minimal additions of equipment while keeping soldier numbers constant. INSCOM and SOCOM units are composed of eight IGE aircraft and four acquisition baseline aircraft; the eight IGE's will be deployed in split based operations at two separate locations. The four baseline aircraft will remain in CONUS for training purposes.

372 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

Executive Summary

A MQ-1C Gray Eagle Follow-on Test & Evaluation (FOT&E) was successfully completed on June 12, 2015. Performance and reliability data were collected on 1,160 flight hours and 1,500 Universal Ground Control Station (UGCS) hours during the 42 sorties flown between May 14, 2015 and June 12, 2015. The FOT&E primary purpose was to evaluate UGCS equipment and the new split-based operations concept. Additional goals accomplished during FOT&E included continuous operation of a Link-16 network (Net Ready KPP) throughout the test event, and successful execution of an Adversarial Assessment Cyber Test. While the Gray Eagle hardware performed exceptionally well throughout the test, preliminary observations and feedback from evaluators emphasized deficiencies directly attributable to training. The PM and U.S. Army Training and Doctrine Command are addressing these concerns.

A MQ-1C Gray Eagle Configuration Steering Board (CSB) was held on July 14, 2015. The CSB was a result of a FY 2016 Resource Management Decision that funded the MQ-1C Gray Eagle program to procure one additional Echelon Above Division (EAD) company and support equipment. Additionally, the CSB considered Courses of Action (COA) for the Army to pursue an extended range capable Improved Gray Eagle and considered the revised Gray Eagle CPD requirement for validation. The CSB, Army Systems Acquisition Review Council and Army Requirements Oversight Council concurred with the COA to validate the revised requirement for the EAD MQ-1C Gray Eagle and granted authority to pursue the extended range capable MQ-1C Gray Eagle configuration for FY 2015 and FY 2016 procurement. The CSB approved procurement of 36 Improved Gray Eagle aircraft. An ADM dated August 13, 2015, approved procurement of 15 additional MQ-1C Gray Eagle Unmanned Aircraft and associated ground support equipment for a total of 167 MQ-1C Gray Eagle aircraft. Additionally, the ADM approved and authorized an acquisition and contracting strategy for Gray Eagle extended range modifications. An updated APB is in staffing and planned for approval in 3rd Quarter FY 2016.

Overall, the MQ-1C Gray Eagle acquisition program costs are stable. There are no anticipated program requirements or issues that would negatively affect program cost. MQ-1C Gray Eagle production continues with Firm Fixed Price FRP I, II and III contracts. FRP IV is planned for contract award in FY 2016. As of December 31, 2015 a total of 131 of 167 MQ-1C Gray Eagle aircraft have been delivered. To date, there are nine companies fielded with approximately 175,000+ flight hours with greater than 90 percent operational availability.

There are no significant software-related issues with this program at this time.

Confidence Level

Confidence Level of cost estimate for current APB: 50%

The ICE to support the MQ-1C Gray Eagle program Milestone C decision, like all life cycle cost estimates previously performed by the CAPE office, is built upon a product-oriented work breakdown structure, based on historical actual cost information to the maximum extent possible, and, most importantly, based on conservative assumptions that are consistent with actual demonstrated contractor and government performance for a series of acquisition programs in which the Department has been successful.

The confidence level for the Full Rate Production-aproved Acquisition Program Baseline (APB) is 50% and is based on the May 9, 2013, approved Army Cost Position and are in accordance with Army cost guidance, Army Regulations (AR) 11-18. It is difficult to calculate mathematically the precise confidence levels associated with life cycle cost estimates prepared for MDAPs. Based on the rigor in methods used in building estimates, the strong adherence to the collection and use of historical cost information, and the review of applied assumptions, we project that it is about equally likely that the estimate will prove too low or too high for execution of the program described.

Quantity Notes

A Gray Eagle Company is configured into three equal platoons. The Gray Eagle System consists of 12 MQ-1C aircraft, each with payloads. Ground equipment includes: six Ground Control Stations, seven Ground Data Terminals, three satellite communication Ground Data Terminals, one Mobile Ground Control Station, the Automated Takeoff and Landing System which consists of six Tactical Automatic Landing System-Tracking Subsystems (two per runway), and Ground Based Sense and Avoid. U.S. Army's Special Operations Command and Intelligence Support Command companies will contain the full complement of system equipment however, the Divisional and National Training Center (NTC) companies will have fewer assets while at Continental United States (CONUS) locations. These units will have nine aircraft and five GCS with corresponding support equipment. When deployed outside CONUS, the Army will reallocate equipment from other units which will bring these companies to full Gray Eagle System equipment strength. Each Gray Eagle company will consist of 125 soldiers within the divisional Combat Aviation Brigade and the NTC. Each unit will have three identical platoons; each platoon is capable of operating independently when fully equipped.

A Resource Management Decision in FY 2015 increased the FY 2016 PB budget for the procurement of an additional 15 aircraft. An ADM directed the Army Acquisition Objective increase from 152 to 167 aircraft and increased the total platoons by three from 31 to 34. Although the fielding strategy evolved, the Army continues to use the number of platoons as the metric to determine program APUC and PAUC.

Low Rate Initial Production

Item	Initial LRIP Decision	Current Total LRIP
Approval Date	3/29/2010	7/3/2012
Approved Quantity	2	6
Reference	Milestone C ADM	LRIP III ADM
Start Year	2010	2012
End Year	2011	2016

The Current Total LRIP Quantity is more than 10% of the total production quantity due to MDA directed quantities to facilitate the MQ-1C Gray Eagle capability entrance into theater as quickly as possible.

Initial LRIP Decision
The original LRIP quantity was two MQ-1C Gray Eagle systems which equates to six platoon sets (24 aircraft).

Current Total LRIP
The Current Total LRIP quantity is six MQ-1C Gray Eagle systems which equates to 18 platoon sets and includes LRIP I (24 aircraft and two attrition aircraft), LRIP II (24 aircraft and five attrition aircraft) and LRIP III (29 aircraft).

Contracts

General Notes

Contract W58RGZ-12-C-0075, Performance Based Logistics (PBL), is not included in the December 2014 and December 2015 SAR. The MQ-1C Gray Eagle program does not have an Acquisition Operations and Maintenance (O&M) contract. Contract W58RGZ-12-C -0075 is for PBL to support fielded systems and funded with O&M, Army - Overseas Contingency Operations accounts.

Contract Identification

Appropriation: Procurement
Contract Name: LRIP 3
Contractor: General Atomics - Aeronautical Systems, Inc.
Contractor Location: 14200 Kirkham Way
Poway, CA 92064
Contract Number: W58RGZ-12-C-0057
Contract Type: Fixed Price Incentive(Firm Target) (FPIF)
Award Date: July 06, 2012
Definitization Date: July 06, 2012

Contract Price							
Initial Contract Price ($M)			Current Contract Price ($M)			Estimated Price At Completion ($M)	
Target	Ceiling	Qty	Target	Ceiling	Qty	Contractor	Program Manager
411.0	424.6	29	541.6	559.5	29	545.8	544.1

Target Price Change Explanation

The difference between the Initial Contract Price Target and the Current Contract Price Target is due to contract modifications P00001 through P00039 adding a platoon set of ground equipment, updated spares, changing from Portable Ground Control Station to Mobile Ground Control Station, and the definitization of an Engineering Change for Universal Ground Control Stations and spares.

Contract Variance		
Item	Cost Variance	Schedule Variance
Cumulative Variances To Date (12/31/2015)	-5.8	-0.7
Previous Cumulative Variances	+2.8	-11.2
Net Change	-8.6	+10.5

403 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

Cost and Schedule Variance Explanations

The unfavorable net change in the cost variance is due to additional subcontractor support on UGCS effort and additional hours incurred in Program Management as a result of several programmatic UGCS and Mobile Ground Control Station changes.

The favorable net change in the schedule variance is due to the June 2015 replan of the Integrated Master Schedule and Performance Measurement Baseline incorporation of Engineering Changes. In addition, deliveries of UGCS hardware during FY 2015 reduced the cumulative schedule variance.

404 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

Contract Identification

Appropriation: Procurement

Contract Name: Full Rate Production (FRP)

Contractor: General Atomics - Aeronautical Systems, Inc.

Contractor Location: 14200 Kirkham Way
Poway, CA 92064

Contract Number: W58RGZ-13-C-0109

Contract Type: Firm Fixed Price (FFP)

Award Date: September 13, 2013

Definitization Date: September 13, 2013

Contract Price							
Initial Contract Price ($M)			Current Contract Price ($M)			Estimated Price At Completion ($M)	
Target	Ceiling	Qty	Target	Ceiling	Qty	Contractor	Program Manager
199.7	N/A	15	580.5	N/A	57	580.5	580.5

Target Price Change Explanation

The difference between the Initial Contract Price Target and the Current Contract Price Target is due to exercising contract options established under the initial contract award, container modifications, and Engineering Changes for Universal Ground Control Stations, Spares, and production quantities for Improved Gray Eagle.

Cost and Schedule Variance Explanations

Cost and Schedule Variance reporting is not required on this (FFP) contract.

405 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

Appropriation: RDT&E

Contract Name: 4.3.2 Software

Contractor: General Atomics - Aeronautical Systems, Inc

Contractor Location: 14200 Kirkham Way
Poway, CA 92064-7103

Contract Number: W58RGZ-13-C-0136

Contract Type: Cost Plus Incentive Fee (CPIF)

Award Date: September 25, 2013

Definitization Date: September 25, 2013

Contract Price							
Initial Contract Price ($M)			Current Contract Price ($M)			Estimated Price At Completion ($M)	
Target	Ceiling	Qty	Target	Ceiling	Qty	Contractor	Program Manager
70.2	N/A	N/A	70.2	N/A	N/A	70.9	71.7

Contract Variance		
Item	Cost Variance	Schedule Variance
Cumulative Variances To Date (12/31/2015)	-1.2	0.0
Previous Cumulative Variances	-0.3	-1.4
Net Change	-0.9	+1.4

Cost and Schedule Variance Explanations

The unfavorable net change in the cost variance is due to additional efforts incurred on the subcontractor’s Information Assurance on software builds, and Systems Engineering to address quality concerns.

The favorable net change in the schedule variance is due to completion of contractual effort for repair of damaged test components.

Notes

This contract is more than 90% complete; therefore, this is the final report for this contract.

Appropriation: Procurement

Contract Name: Engineering Services II

Contractor: General Atomics - Aeronautical Systems, Inc.

Contractor Location: 14200 Kirkham Way
Poway, CA 92064-7103

Contract Number: W58RGZ-13-C-0110

Contract Type: Cost Plus Fixed Fee (CPFF)

Award Date: September 30, 2013

Definitization Date: September 30, 2013

Contract Price							
Initial Contract Price ($M)			Current Contract Price ($M)			Estimated Price At Completion ($M)	
Target	Ceiling	Qty	Target	Ceiling	Qty	Contractor	Program Manager
38.5	N/A	N/A	76.2	N/A	N/A	71.4	69.6

Target Price Change Explanation

The difference between the Initial Contract Price Target and the Current Contract Price Target is due to exercising contract options established under initial contract award for Solid Core, Airworthiness and Universal Ground Control Stations and contract modifications through P00042.

Contract Variance		
Item	Cost Variance	Schedule Variance
Cumulative Variances To Date (12/31/2015)	+6.7	-2.9
Previous Cumulative Variances	+10.6	-3.2
Net Change	-3.9	+0.3

Cost and Schedule Variance Explanations

The unfavorable net change in the cost variance is due to completion of Program Management effort and Tactical Signals Intelligence Payload Hardware/Software Development Sub-Engineering Services Memorandums (SESM).

The favorable net change in the schedule variance is due to ongoing efforts on Special Operations Command Vortex Integration SESM.

Deliveries and Expenditures

Deliveries				
Delivered to Date	**Planned to Date**	**Actual to Date**	**Total Quantity**	**Percent Delivered**
Development	2	2	2	100.00%
Production	25	25	32	78.13%
Total Program Quantity Delivered	27	27	34	79.41%

Expended and Appropriated (TY $M)			
Total Acquisition Cost	5121.4	Years Appropriated	12
Expended to Date	3192.3	Percent Years Appropriated	85.71%
Percent Expended	62.33%	Appropriated to Date	4962.5
Total Funding Years	14	Percent Appropriated	96.90%

The above data is current as of February 29, 2016.

131 MQ-1C Gray Eagle aircraft of 167 planned (152 planned in Current APB) completed the Material Inspection and Receiving Reporting process as of December 31, 2015. Inspected and received MQ-1C Gray Eagle aircraft is the metric used for deliveries and is converted to systems.

408 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

Operating and Support Cost

Cost Estimate Details

Date of Estimate:	June 14, 2013
Source of Estimate:	SCP
Quantity to Sustain:	31
Unit of Measure:	System
Service Life per Unit:	20.00 Years
Fiscal Years in Service:	FY 2011 - FY 2037

The O&S estimate is based on the June 14, 2013 DAB approved FRP Service Cost Position. The MQ-1C Gray Eagle O&S cost estimate includes 152 MQ-1C Gray Eagle acquisition program aircraft, 31 platoons with associated ground equipment, and results in 327 operational system years over a 20 year service life. O&M cost was based on actual Unmanned Aircraft System (UAS) consumption data, analogy to Predator, and O&S Management Information System (OSMIS) Blackhawk data. The cost is applied as steady state across the MQ-1C Gray Eagle program in accordance with the program schedule.

An updated APB is currently being staffed with PM UAS and the Deputy Assistant Secretary of the Army for Cost Estimating and should be completed 3rd Quarter FY 2016.

O&S changes listed in earlier sections of the SAR, namely the Executive Summary and Cost and Funding sections, that relate to the FY 2015 Congressional Plus-up, FY 2016 PB with increased procurement from 152 to 167 aircraft, and an increase of three platoons from 31 to 34 are not included in this O&S section. These changes will be reflected in the next SAR.

A basic MQ-1C Gray Eagle system includes balanced platoons, each with four aircraft and associated support equipment and payloads to include: Electro-Optical/Infrared/Laser Designator, communications relay, and up to four Hellfire Missiles. The Common Sensor Payload and Synthetic Aperture Radar/Ground Moving Target Indicator are one per aircraft. Ground equipment at a platoon level includes: two Universal Ground Control Stations, three Universal Ground Data Terminals, one satellite communication Ground Data Terminal, one Mobile Ground Control Station per Gray Eagle Company, an Automated Take Off and Landing System which includes two Tactical Automatic Landing Systems and ground support equipment to include Ground-Based Sense and Avoid. A MQ-1C Gray Eagle Company is configured into three equal platoons and includes nine MQ-1C Gray Eagle aircraft for conventional companies (non-deployed) and when deployed the Army will adjust a company to full MQ-1C Gray Eagle System strength (12 aircraft and associated ground support equipment).

Sustainment Strategy

The sustainment strategy includes a Performance Based Logistics (PBL) contract. Soldiers operate systems and perform 85 percent of the basic field maintenance. Field Service Representatives support the remaining 15 percent of basic field maintenance through PBL efforts. Some of the Depot Level Reparables will be accomplished by organic depots through a Public Private Partnership (PPP) arrangement. The PPP with organic depot efforts will be determined through cost-benefit analysis and application of section 2466, title 10, U.S.C. and the 50-50 rule.

Antecedent Information

No Antecedent

409 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

Annual O&S Costs BY2010 $M		
Cost Element	**MQ-1C Gray Eagle Average Annual Cost Per System**	**No Antecedent (Antecedent) N/A**
Unit-Level Manpower	10.300	0.000
Unit Operations	1.300	0.000
Maintenance	3.460	0.000
Sustaining Support	3.750	0.000
Continuing System Improvements	0.360	0.000
Indirect Support	0.870	0.000
Other	2.460	0.000
Total	22.500	--

The $2.460M Other cost is O&M related, Military Pay and Allowances (Medical & Morale, Welfare, Recreation) and includes other costs from U.S. Army Special Operations Command (USASOC) and Aerial Exploitation Battalions (AEB).

Item	Total O&S Cost $M			
	MQ-1C Gray Eagle			No Antecedent (Antecedent)
	Current Production APB Objective/Threshold		Current Estimate	
Base Year	7357.3	8093.0	7357.3	0.0
Then Year	9950.8	N/A	9950.8	N/A

On February 5, 2013, the Chief of Staff of the Army approved an Execution Order (EXORD) changing the MQ-1C Gray Eagle fielding configuration to provide greater capability across the Army. The EXORD directed fielding MQ-1C Gray Eagle companies to ten Army divisions, one to the National Training Center (NTC), two to USASOC units, and two to the AEB for a total of 15 companies. The two USASOC companies will be configured with 12 aircraft each (24 total) and the 13 companies assigned to Army divisions, NTC and the AEBs will be fielded with nine aircraft each (117 total) while based in the Continental United States (CONUS). Seven aircraft are assigned to the institutional training base at Fort Huachuca, Arizona. The four remaining aircraft are for attrition. When a company or AEB assigned to a division deploys outside CONUS, the Army will reassign equipment, as required, to bring the company to full MQ-1C Gray Eagle system equipment strength (12 aircraft and associated ground support equipment).

Equation to Translate Annual Cost to Total Cost

Total O&S Costs $7357.3 (BY 2010 $M) / 327 Operational System years = $22.5 (BY 2010 $M) per system.

FOREWORD

Eliminate all other factors, and the one which remains must be the truth.

—Sir Arthur Conan Doyle
in "The Sign of the Four"

As this report is being published, I am concluding 5 years of serving as the Under Secretary of Defense for Acquisition, Logistics, and Technology. This fourth report in the series continues my long-term effort to bring data-driven decision making to acquisition policy. This report demonstrates that the Department of Defense (DoD) is making continuing progress in improving acquisition. The overall series presents strong evidence that the DoD has moved—and is moving—in the right direction with regard to the cost, schedule, and quality of the products we deliver. There is, of course, much more that can be done to improve defense acquisition, but with the 5-year moving average of cost growth on our largest and highest-risk programs at a 30-year low, it is hard to argue that we are not moving in the right direction.

Each year we add cumulative data and new analysis to the report. This year is no exception. While that data can show us ways and places to improve, I believe there is no secret to what it takes to achieve good results in defense acquisition. The short form of this is to: (1) set reasonable requirements, (2) put professionals in charge, (3) give them the resources that they need, and (4) provide strong incentives for success. Unfortunately, there is a world of complexity and difficulty in each of these four items.

Creating new—and sometimes well beyond the current state of the art—weapons systems that will give our warfighters a decisive operational advantage far into the future will never be a low-risk endeavor. That risk can be managed, however, and while we should not expect perfection, we should be able to keep the inevitable problems that will arise within reasonable bounds. We should also be able to continuously improve our performance as we learn from our experience and work to improve our ability to make sound acquisition decisions. This volume and its predecessors are dedicated to these propositions.

We open this volume with some accrued insights and an attempt to refute some popular myths about defense acquisition. Too much of our decision making on acquisition policy has been based on cyclical and intuitive conventional wisdom and on anecdote—or just the desire, spurred by frustration, to affect change. As I've worked in this field for more than four decades, it has become clear to me that there is no "acquisition magic"—no easy solution or set of solutions that will miraculously change

414 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

our results. Most attempts to direct or legislate acquisition "magic" in some form have been counterproductive and often only increased the system's bureaucracy and rigidity or led to excessive risk taking—neither of which is helpful. What we need, and always will need, is professionalism, hard work, attention to detail, and flexible policies and incentives that the data show align with the results we desire. Improving each of these is a continuous endeavor of which this volume is a part.

The Honorable Frank Kendall,
Under Secretary of Defense for
Acquisition, Technology, and Logistics

415 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

PRINCIPLES FOR IMPROVING DEFENSE ACQUISITION

People matter most; we can never be too professional or too competent.

Continuous improvement will be more effective than radical change.

Data should drive policy.

Critical thinking is necessary for success; fixed rules are too constraining.

Controlling life-cycle cost is one of our jobs; staying on budget isn't enough.

Incentives work—we get what we reward.

Competition and the threat of competition are the most effective incentives.

Defense acquisition is a team sport.

Our technological superiority is at risk and we must respond.

We should have the courage to challenge bad policy.

ORGANIZATION OF THE REPORT

Highlights. The following section briefly discusses recent actions and key findings from the report, providing page references to detailed discussions in the main body. It also provides some insights to illustrate how this kind of analysis is informing actions within the DoD. Though not comprehensive, it provides perspectives and insights gleaned from the entire report.

Chapter 1 provides background material on acquisition, spending levels and trends, and general perspectives on measuring institutional performance to set the stage for the analysis presented in subsequent chapters.

Chapter 2 analyzes the performance outcomes of our acquisition institutions from a variety of perspectives: DoD-wide, by commodity type, contract- and program-level, military department, and contractors. This chapter builds on the results from prior annual reports, updating some analysis and providing new results using different datasets. To a large extent, this chapter presents an ongoing view of performance and trends.

Chapter 3 discusses new analysis on broader factors that influence acquisition outcomes. We start with how broad acquisition reforms and the funding climate affect program cost growth. We follow with analysis that identifies the major correlates of cost growth in Operating and Support (O&S) cost estimates while programs are in acquisition. We then provide a short progress report on the implementation of our affordability process, followed by preliminary analysis of the stability of program requirements. Following this, we provide analyses on how many units we procure relative to original plans, an update of program cancellation and sunk costs, and the frequency of new major program starts. Finally, the chapter closes with summary analysis and highlights of issues, successes, and suggestions from our program managers and program executive officers.

Chapter 4 provides selected measures of the inputs to the defense system and its internal processes, including acquisition workforce improvements and incentives, contractor bid-protest rates and outputs, our performance relative to competition and small-business goals, and trends in improving the efficiency and backlog of contractor audits.

Appendix A provides a concise overview of DoD's Better Buying Power strategic effort to improve defense acquisition efficiency and effectiveness.

Appendices B–E provide details on the statistical analyses and methods employed in selected studies.

Appendix F–G defines program and general acronyms used in the report.

Appendices H–I lists the figures, tables, and references in the report.

PERFORMANCE HIGHLIGHTS

A key part of improving a system is objectively measuring its performance and the effects of policies, processes, and inputs on the outcomes of the system. Without this, we cannot tell where we have problems, what is working (or not), and whether management changes are making things better (or worse). In the case of defense acquisition, the primary outcome is the value of operational capabilities delivered in time for our warfighters to address threats. Unfortunately, it is very difficult to measure the final operational performance and value of our systems across systems and commodities. Our reports can objectively measure and thus focus on the cost, schedule, and technical performance of our acquisitions—aggregated to look for statistically significant trends together with correlates, institutional differences, and theory to inform ways to improve future outcomes. Each performance measure has its strengths and weaknesses, so we use multiple measures (e.g., at both the program and contract level) and subsequent analysis to see if the answers point in the same direction. We add experience and theoretical insights to guide our conclusions.

This is the fourth annual report on the Performance of the Defense Acquisition System, using quantitative analysis of broad data to measure institutional performance. This annual report series is a central part of Better Buying Power (BBP). It continues to reflect results in defense acquisition performance from ongoing DoD compliance with the Improve Acquisition Act of 2010 and the earlier Weapon Systems Acquisition Reform Act of 2009. Although similarly motivated, our efforts go beyond the specifics of those laws to seek additional insights for improving the defense acquisition system's performance. This study also fulfills ongoing Office of Management and Budget (OMB) requests for evidence-based analytic studies on acquisition performance. It is encouraging to see evidence of performance improvement over the last few years. However, these results are not a reason to pause in our efforts. They should motivate us to press ahead even more vigorously.

PRIOR ANNUAL REPORTS IN THE SERIES

The first report by the Under Secretary of Defense (USD) for Acquisition, Technology, and Logistics (USD(AT&L), 2013b)[1] analyzed recent and historical data to establish performance references and to begin looking for evidence of what factors affect cost, schedule, and technical performance. For example, we found that undefinitized contract actions (UCAs) usually can be employed in early procurement without incurring cost growth, but UCAs correlate historically with cost and schedule growth on development contracts. That first report also established measures of cost growth at both the program and contract levels that avoid confounding issues

[1] Throughout this report we follow APA and Chicago style guidelines wherein multiple documents in the same year by the same author are differentiated by adding sequential letters (a, b, c, etc.) after the year in order of publication.

424 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

such as quantity effects, reporting these measures across our major programs and their contracts. We realized that years will be needed to see the full results of our improvement initiatives (our major programs last many years and new policies tend to affect programs incrementally). The journey toward data-driven policies started with our original report and continues here.

The second report (USD(AT&L), 2014a) built on the first, adding another year of data to the series of cost, schedule, and technical performance measures while reporting insights from new policy analysis. Some signs of improvements were seen—but not everywhere. Outliers required further analysis given their distorting effects on the portfolio in certain metrics and on the overall perceptions about the defense acquisition system when viewed as exemplars. Expanded analysis of the correlation of contract type on cost and schedule outcomes found that the prevalent debate on whether "cost-reimbursement" or "fixed-price" contracts are best at controlling prices is a red herring. The *real* issue is how effective the incentives are for each contract type based on the situation at hand. Also, firm-fixed-price contracting alone may not result in fixed prices in the end because some fixed-price contract deliverables are structured as narrow requirements or increments so that the Government still has all the true risks and must pay for changes. We found that incentive contracts (cost-plus-incentive-fee and fixed-price-incentive) control cost, price, and schedule as well as, or better than, other types—and with generally lower, yet fair, margins. Each situation depends on risk, cost knowledge, uncertainty, and a number of other factors—so we should avoid dictating a single approach.

Last year's annual report built on and extended the series of data from the first two reports. We saw more statistically significant trends and differences, so we have greater confidence in the positive changes we are seeing. Cost growth on our major programs generally is at, or better than, historical levels, but outliers remain a problem. Median biennial change in total needed program funding has been near zero since 2009 (although past growth over baselines remains). Contractors on Major Defense Acquisition Program (MDAP) contracts are doing a better job of meeting cost targets. The number of MDAP contracts started since 2009 with price reductions has increased significantly compared to earlier contracts. Also, preliminary analysis showed that the percentages of government execution costs (direct and overhead) are at or below defense industry overhead levels, and they are not unreasonable in absolute percentages. Additionally, work from the Institute for Defense Analyses (and confirmed by the related analysis below) provided an important cautionary tale that high acquisition cost growth for programs and tight budgetary environments (like the one at present) during program baselining are very strongly correlated.

Below are highlights of this fourth report along with page references to more detailed discussion later in the report. As with the prior annual reports, many analyses are beginnings and indicate areas that need further work, but in others we now see similar indicators in multiple measures, increasing our confidence in the results.

While we use somewhat different metrics, our program-level results reflect what the Government Accountability Office (GAO) has been reporting recently (see GAO, 2014, 2015a)—that we are seeing significant, measurable improvements in cost control for recent years.

425 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

ACTIONABLE INSIGHTS

The highlights below and detailed data in this report provide useful insights for stakeholders and practitioners.

Myth Busters

Myth: All defense acquisition programs have large cost growth.
Reality: **Cost control has improved significantly.** Not only is cost growth significantly lower than historical levels, but recent efforts have dramatically lowered cost growth further. Multiple measures summarized below show statistically lower cost growth on major programs: number of Nunn-McCurdy breaches; Section 828 "overruns" on programs since 2009; proportion of programs needing less funding than originally planned; biennial cost growth in development and production; total production cost growth; and annual growth of contracted costs. Historical analyses also show that cost controls are better than in the decades before Goldwater-Nichols (USD(AT&L), 2014a, pp. 47–49). We do still have legacy problems on older programs. Total research, development, test and evaluation (RDT&E) cost growth is still rising due to older programs. We need to do better through continued evolutionary improvements, but recent improvements focused on acquisition fundamentals and an empowered government workforce have been more successful than laissez-faire acquisition reforms of the mid-1990s or prior to the passage of Goldwater-Nichols and the Packard Commission reforms of the late 1980s.

Myth: Defense programs usually cut quantity (e.g., to pay for cost growth).
Reality: **Most major programs deliver the original baseline quantity or more.** We don't as a rule cut program quantity. As discussed below and on p. *104*, most MDAPs actually produce the quantities we originally planned at Milestone (MS) B. This runs counter to the impression given from just focusing on certain high-visibility programs such as the F-22 program or the DDG 1000 Zumwalt-class destroyer that incurred major cuts in quantity.

Myth: Swings in O&S cost estimates indicate poor program management.
Reality: **The dynamics of cost estimates indicate that O&S costs appear to be heavily driven by external inflation factors.** Analysis shows that the recent dynamics of program O&S costs estimated during acquisition correlate with the dynamics of labor, health-care, fuel, and maintenance costs. While this aligns with intuition, it also indicates that O&S cost increases involve both factors that the acquisition system cannot control (e.g., wages, health-care costs, and fuel costs) as well as some that can, in part be controlled (e.g., system reliability, fuel efficiency, and ease of maintenance). Operational tempo also affects O&S costs through many of these factors (e.g., the amount of fuel consumed and maintenance costs), and changes in forecasted tempo will affect O&S costs independent of both inflation and weapon system performance. Thus, while the acquisition system needs continued attention to the levers it can control (with full knowledge that their effects often will not be seen for decades), stakeholders need to recognize the strong influence of other factors on O&S costs. (*See discussion starting on p. 95.*)

426 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

Myth: Program requirements are unstable.
***Reality:* High-level requirements seldom change on major programs, and very few programs have many changes.** About 85 percent of MDAPs showed no changes that we could trace from the original MS B baseline to the latest Selected Acquisition Report (SAR) report for the program. Moreover, of the few programs with any traced changes, most had only one. This is commensurate with experts' experience and GAO's findings (2015b), which also indicate that changes are largely made at the engineering level as development seeks ways to meet high-level requirements. Changes, however, are not always bad. Some changes reflect prudent requirement reductions to unforeseen high costs of options uncovered in development or new affordability pressures. Other changes address new threats that otherwise would render an unmodified system obsolete upon delivery. Thus, flexibility, prudence, and continued tradeoffs, together with ruthless management attention to cost implications, are more important in the end than simple edicts at the extremes of change control. (*See discussion starting on p. 100.*)

Myth: The DoD cannot acquire systems quickly.
***Reality:* DoD acquisition can be timely and responsive.** Despite criticism that defense acquisition is too slow, the highlights below show that schedule growth is lower than cost growth in development, and cycle times for major programs have increased only from about 5 years to 7 years since the 1980s with dramatic increases in weapon system complexity.[2] This is not to say that internal processes cannot be improved, so efforts continue to institutionalize streamlining and tailoring.

Myth: Increased bid protests reflect a deteriorating ability to conduct source selections.
***Reality:* Contracting processes are generally fair, rigorous, and objective—and protests are rarely sustained**. Despite concerns arising from increased numbers of protested solicitations and contract awards, GAO data indicate that protests and sustainments remain very low both in number and as a percentage of solicitations and awards. Protests to GAO have averaged about 2.5 percent of solicitations and about 0.25 percent of contracts. The sustainment rate remains very low—about 30 per year, or 2 percent of the approximately 1,300 annual protests. *(See discussion starting on p. 125.)*

Myth: The DoD is pursuing cost savings at the expense of contractor profits.
Reality: **Major defense companies remain profitable despite the DoD's increased success at tying profits to performance**. Further data build on prior reports to show that the DoD's efforts to improve cost performance are not a war on profits but a reasonable alignment of industry and government goals. *(See Figure H-21 on p. xlviii below.)*

Myth: Defense acquisition is broken.
Reality: **The acquisition system for decades has given the United States the most capable military in the world and has been improving both in the past and more recently.** While there is no absolute definition for sufficiency, the data in these annual performance reports indicate

[2] Also, unpublished analysis indicates that the DoD has successful approaches for rapidly acquiring urgently needed capabilities that leverage mature technology. These approaches generally are limited by available technology restrictions on reprogramming appropriated funds.

427 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

that the system functions reasonably well compared to the past and continues improving. We cannot look at a single metric to measure the performance of the defense acquisition system, and many metrics work at odds with each other. For example, the so-called "iron triangle" of cost, schedule, and technical performance has long shown that emphasizing one or two dimensions often is done at the expense of the others. While cost (followed by schedule) metrics are the easiest to quantify, data for all three dimensions indicate stability and, in many cases, significant improvement.

Insights for Current and Future Leadership

First, let us discuss insights that primarily affect both DoD-wide and DoD Component[3] leadership.

The lack of programs in our "new product pipeline" may be putting technological superiority at risk. Both RDT&E budget levels—particularly Engineering and Manufacturing Development budgets—and program new-start data indicate a slowdown since the mid-2000s. Total budget reductions limit what we can do, but it is important to step back and watch these macro trends in the context of increasing threats (technologically, pace, and diversity). The DoD's recent response has been to add a number of early stage experimental prototyping efforts. This is an important and necessary step but does not deliver capability or designs that are ready for production and fielding in any substantial quantity.

Be particularly careful to ensure realistic program baselines—especially when budgets are tight. Further analysis published in this report reinforces prior concerns that excessive optimism or risk tolerance may be particularly acute when programs are initiated during tight budget periods (such as at present), leading to the higher cost growth seen on these programs. We should explicitly recognize this and avoid setting up our successors for large overruns.[4] For example, acquisition and DoD Component leadership should ensure adequate risk reduction before MS B and apply healthy skepticism about novel approaches that are marketed as offering substantial cost reductions (i.e., if it sounds too good to be true, it probably is. In a tight-budget climate, industry is motivated to be optimistic and take greater risk in order to win new business. DoD programmers also are motivated to put pressure on acquisition professionals to lower cost estimates and funding requirements. Because of these tendencies, the Defense Acquisition Executive (DAE) is focusing particularly on cost and schedule realism for Acquisition Category (ACAT) I and Major Automated Information Systems (MAIS) programs at milestone decision reviews. (*See detailed analysis and discussion starting on p. 92.*)

[3] For purposes of this report, *DoD Components* include the Office of the Secretary of Defense (OSD), military departments, and all defense agencies, DoD field activities, and other entities within the DoD that are authorized to award or administer contracts, grants, cooperative agreements, and other transactions.

[4] See, for example, the bidding and acceptance on the Space-Based Infrared Systems-High (SBIRS-High) program (Thompson, 2012), and the problem of overly optimistic cost estimates at MS B for the F-35 (DPARCA, 2010f).

428 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

Be prepared to incur statutory overrun penalties. As shown in Table H-2 (p. xxxiv below), the Army and Navy are a few billion dollars away from incurring a Section 828 penalty for Program Acquisition Unit Cost (PAUC) cost growth on MDAPs that started since 2009. Growth on individual programs may be warranted in order to address threat or critical engineering issues, and the prospect of penalties should not deter sound decisions on program content or requirements. The penalties were created to encourage better program planning, but the impact, which will come years after program initiation, is more likely to affect decisions made after cost growth is realized. Penalty avoidance, like Nunn McCurdy avoidance, should not be the primary decision criterion once cost growth has been realized; the priority should be getting critically needed capability to the warfighter at the best cost possible.

We need a metric for the portion of O&S costs related solely to weapon system design and performance. Analysis shows that many of the factors that correlate with growth of O&S cost estimates reported during acquisition are outside the control of the acquisition system (i.e., wages, health-care costs, and fuel prices). Current O&S metrics do not separate acquisition program effects from these external effects. However, a new metric could be developed to measure these internal program effects by holding the external variables constant from MS B forward (solely for purposes of comparison) so that the effects solely from the acquisition system are revealed.

Listen to feedback from the DoD's professional acquisition leadership. The annual program manager (PM) assessments sent to the DAE provide useful perspective on the realities of conditions where acquisition actually takes place—in program offices. Our PMs tended to be positive about strategy, system performance, program cost, and contracting (although the latter was raised often as both a success and issue). Conversely, funding difficulties, risks, and cyber issues top the list of concerns. Some topics have high levels of both success and problems—especially schedule performance, contractor performance, and the implications of changing technology. (See p. 110.)

Just as important, our program executive officers (PEOs) raised a number of system issues across their portfolios while making insightful suggestions on how we can improve the defense acquisition system (see p. 114). For example, the PEOs note that system improvements (e.g., savings) come at a cost—namely, we need sufficient workforce to think through and execute more efficient acquisition approaches. Blind "headquarter" or other cuts in government and contractor workforce can be extremely counterproductive.

Program-Level Insights

Focusing on acquisition fundamentals and cost control makes a difference. Proactive management and creative thinking contribute significantly and measurably to cost control. Multiple measures and analyses in this and prior annual reports (e.g., see Figure H-4 on p. xxviii) show that fundamentals work in controlling costs. We need to keep up the good work. These savings are dependent on workforce expertise, sufficiency, empowerment, and the degree to which we can illustrate and prove these linkages will go a long way toward ensuring continued success. The institution of "should cost" management and its consistent emphasis over the last

429 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

6 years by the acquisition chain-of-command been a success and should be a permanent feature of the DoD's acquisition culture. Staying within budget is not the definition of success.

Don't neglect suitability (reliability, maintainability, etc.) in pursuing system performance. Operational tests show that major programs are often effective when they tested as operationally suitable, but the converse is not true (see p. 20). This correlation by itself does not prove causality, but it reinforces the logic that the so-called "-illities" (e.g., interoperability, availability, maintainability, reliability) are important to achieving the mission. For example, well-engineered systems that address suitability factors are probably also better positioned to be effective. Also, no matter its features, a weapon system may not serve its function if it is unreliable and unavailable to the warfighter.

Don't neglect O&S cost implications in early system requirements and design. Analysis shows that many of the factors that correlate with growth of SAR O&S cost estimates (i.e., wages, health-care costs, and fuel prices) are outside of program management control. While PMs cannot control these external factors, they can affect fuel efficiency and maintenance costs (e.g., system reliability, ease of maintenance, and repair automation). Usually, these aspects must be addressed very early in the system's design, so don't neglect them in early program planning and management. That is why the new affordability process sets goals and caps on life-cycle costs early in the program's life (e.g., at the point of the Materiel Development Decision (MDD) and MS A, when bigger design changes can be made). Don't neglect them just because you cannot control the external factors and uncertainties remain.

Don't let up on ensuring rigorous source selections that align government value structures, source-selection rules, and industry's goal of winning. While GAO data on source selections provide encouraging news that our practices generally are fair and rigorous, we should not let up on efforts to improve source selections. The basic integrity and fairness of our processes are fundamental to maintaining public confidence in how taxpayer resources are spent.

Use fixed-price contracting judiciously in development. In our updated guidance on contract incentives (Director of Defense Procurement and Acquisition Policy [DDPAP], 2016b), data from prior annual reports (USD(AT&L), 2014a), and experience (Kendall, 2013) indicate using fixed-price contracts in development can be very risky and counterproductive, while incentive contracts can yield good cost control at lower risk and lower prices. All of the following five criteria should generally be met before using fixed-price contracts in development:

1) Requirements are stable
2) Technologies are mature
3) The contractor is experienced
4) The contractor can absorb overruns
5) The contractor has a business case for absorbing any overruns that occur

430 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

ACTIONS SINCE THE LAST REPORT

This annual report measures institutional performance trends using a variety of metrics. This year we also provide a summary of major actions and events that have occurred since the last report.

Major Program Actions by the DAE

- **Delegation**. Milestone Decision Authority was delegated from the DAE to the respective DoD Component (usually a military department) on 28 ACAT I programs since July 2015.[5]
- **CH-53K.** Advanced procurement to support the first CH-53K heavy-lift helicopter's low-rate initial production (LRIP) lot was approved in April 2016 to position the program for MS C without further impacting projected Initial Operational Capability (IOC) date. Should MS C ultimately not be approved, these parts and material would be used for other rotary wing aircraft within the current Navy inventory.
- **DEAMS.** Limited Deployment was granted to enable the Air Force to improve over initial operational test results prior to returning for a Full-Deployment Decision of this accounting and management system. The Air Force will also conduct a critical change review to ensure that: the new cost and schedule estimates for the program include plans to reduce defects consistent with a program of this maturity; the Oracle R12 upgrade is completed effectively; and future deployments are tied to performance gains verified through demonstrated software stability and logically sequenced test events.
- **EPAWSS.** The high reliance on off-the-shelf components allowed the F-15 Eagle Passive/Active Warning and Survivability System (EPAWSS) acquisition to be highly tailored, have a very short Technology Maturation and Risk Reduction (TMRR) phase, and have Milestone Decision Authority (MDA) delegation to the Air Force.
- **F-35.** We continue to negotiate better prices aligned with actual costs and employ strong contract performance incentives on LRIP lots to drive costs down, improve performance, and minimize concurrency problems. The Air Force declared IOC in August 2016 for the conventional F-35A variant fighter jet.
- **FAB-T.** The Family of Advanced Beyond Line of Sight Terminals (FAB-T) Command Post Terminal (CPT) subprogram passed MS C in October 2015 to support Presidential and National Voice Conferencing operational transition from existing aging assets and maintain the earliest possible FAB-T CPT IOC schedule.

[5] Delegations from July 2015 through September 2016:

Army:	DCGS-A Inc 1, GCSS-A, H-47 Block II, IFPC Inc 2-I, JLTV, LMP Inc 2, PAC-3 MSE, PIM, IPPS-A, and WIN-T Inc 2
Navy:	AAG, CANES, LHA-6JPALS, P-8A, MQ-8, MUOS, SSN 774, and T-AO 205
Air Force:	WAS, AEHF, F-15 EPAWSS, ICBM Fuze Modernization, MOP GBU-57A/B, MPS Inc 5, Space Fence Inc 1, and CRH
Defense Health Agency:	TMIP-J

(program abbreviations are defined in Appendix F starting on p. 169).

431 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

- **GBSD.** The Ground Based Strategic Deterrent (GBSD) program was approved in August 2016 to enter TMRR, but significant cost and industrial-base uncertainties remain given limited historical data and the long period since the last Intercontinental Ballistic Missile (ICBM) development program. TMRR will produce more current and directly applicable information to support higher confidence cost estimates and inform baselines.
- **GPS OCX.** The DAE, Secretary of the Air Force, acquisition chain of command, and prime contractor's chief executive officer together are conducting quarterly "deep dive" reviews as a result of continued cost increases and schedule slips. The Global Positioning System (GPS) next-generation Operational Control System (OCX) program also breached its critical Nunn-McCurdy threshold in June 2016 *(see p. 26)*.
- **JAGM.** Given the strong potential for future international sales, the Joint Air-to-Ground Missile (JAGM) program is implementing Defense Exportability Features in Engineering, Manufacturing and Development (EMD), and the Army plans to obtain the appropriate Technology Security/Foreign Disclosure approval authorities prior to MS C.
- **KC-46A.** MS C and approval for LRIP were authorized in August 2016 at a higher quantity to permit an orderly increase in the production rate of this military aerial refueling and transport aircraft upon completion of operational testing, which was delayed to correct design and manufacturing issues and to complete performance verification and hardware certification. The contractor, Boeing, has now recorded reach-forward losses totaling about $1.7 billion on the EMD phase contract (Boeing, 2016).
- **RMS.** The Remote Minehunting System (RMS) was canceled in March 2016 due to unsatisfactory progress on system reliability and availability *(see p. 26)*.

Institutional and Policy Changes

- **Acquisition Workforce Development.** The DoD continues to increase the capabilities of our workforce, leveraging legislated authorities and funding such as the Defense Acquisition Workforce Development Fund (DAWDF) as well as the Force of the Future initiatives *(see p. 119).*
- **M&As.** The Department of Justice clarified DoD authorities on mergers and acquisitions (M&As), resolving concerns that we had insufficient authorities to address our wider concerns regarding about the ongoing consolidation trend in the defense industry.
- **Innovation and Technical Excellence.** The DoD essentially has completed the initial implementation of the BBP 3.0 set of acquisition policy initiatives and continues monthly follow-up through the Business Senior Integration Group.
- **Commercial Outreach.** The DoD renewed outreach to the commercial sector through the Defense Innovation Unit, Experimental (DIUx).
- **Independent Research and Development (IR&D).** In February 2016, the DoD proposed a Defense Federal Acquisition Regulation Supplement requirement that an appropriate DoD official be notified of new IR&D efforts in order to ensure that these investments are of potential interest to the DoD. Then results would have to be reported to facilitate utilization. We also issued in February an advanced notice of proposed rulemaking that would preclude misusing future IR&D expenditures to reduce evaluated bid prices in competitive source selections.

432 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

- **Intelligence Support to Acquisition.** To better address emerging threats, we are improving the latency, dissemination, and relevance of intelligence to inform acquisition planning and system updates.
- **Contracted Services.** A new DoD Instruction (DoDI) 5000.74 was issued in January 2016 to establish a management structure for the acquisition of contracted services while authorizing DoD Component decision authorities to tailor the procedures to best achieve cost, schedule, and performance objectives (USD(AT&L), 2016).
- **Affordability.** We continue to apply and enforce affordability constraints on MDAPs and smaller programs, driving requirements tradeoff and management decisions during execution *(see p. 99).*
- **Independent Technical Risk Assessments.** We released a new *Risk, Issue, and Opportunity Management Guide* in June 2015 to help programs better identify risks, quantify their potential effects, and develop strategies to address and mitigate those risks.
- **Cybersecurity.** We are ensuring that new cybersecurity regulations are applied to DoD contracts to better secure unclassified controlled technical information resident in the defense industry.
- **Source-Selection Procedures.** A common set of principles and procedures for effectively conducting competitively negotiated source selections was updated in March 2016, including new guidance on Value-Adjusted Total Evaluated Price (VATEP) tradeoffs and appropriate uses of Lowest-Price Technically Acceptable (LPTA).
- **Incentive and Other Contract Types.** A major guidebook update (DDPAP, 2016b) provides advice on the selection and negotiation of the most appropriate and effective contract type and incentives for a given acquisition situation, emphasizing how to apply judgment and tailor our contracting to improve outcomes and contractor performance.
- **O&S Cost Management.** Published in February 2016, a new guidebook for PMs and product-support managers provides tools and best practices for O&S cost analyses to inform early life-cycle decisions, effect reliability trades, and identify Should-Cost initiatives having the greatest effect on future O&S costs.
- **Performance-Based Logistics.** A March 2016 update of our *Performance-Based Logistics (PBL) Guidebook* reviews common myths about PBLs, adds new guidance regarding intellectual property issues, and continues to provide best practices, selection criteria for when PBLs are appropriate, and practical examples to maximize successful outcomes (Assistant Secretary of Defense for Logistics and Materiel Readiness, 2016).
- **PM/PEO Assessments.** To better understand performance issues and successes in the acquisition system, we expanded the annual PM assessments to include PEO assessments sent directly to the DAE and Service Acquisition Executives (SAEs) *(see pp. 110 and 114).*

433 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

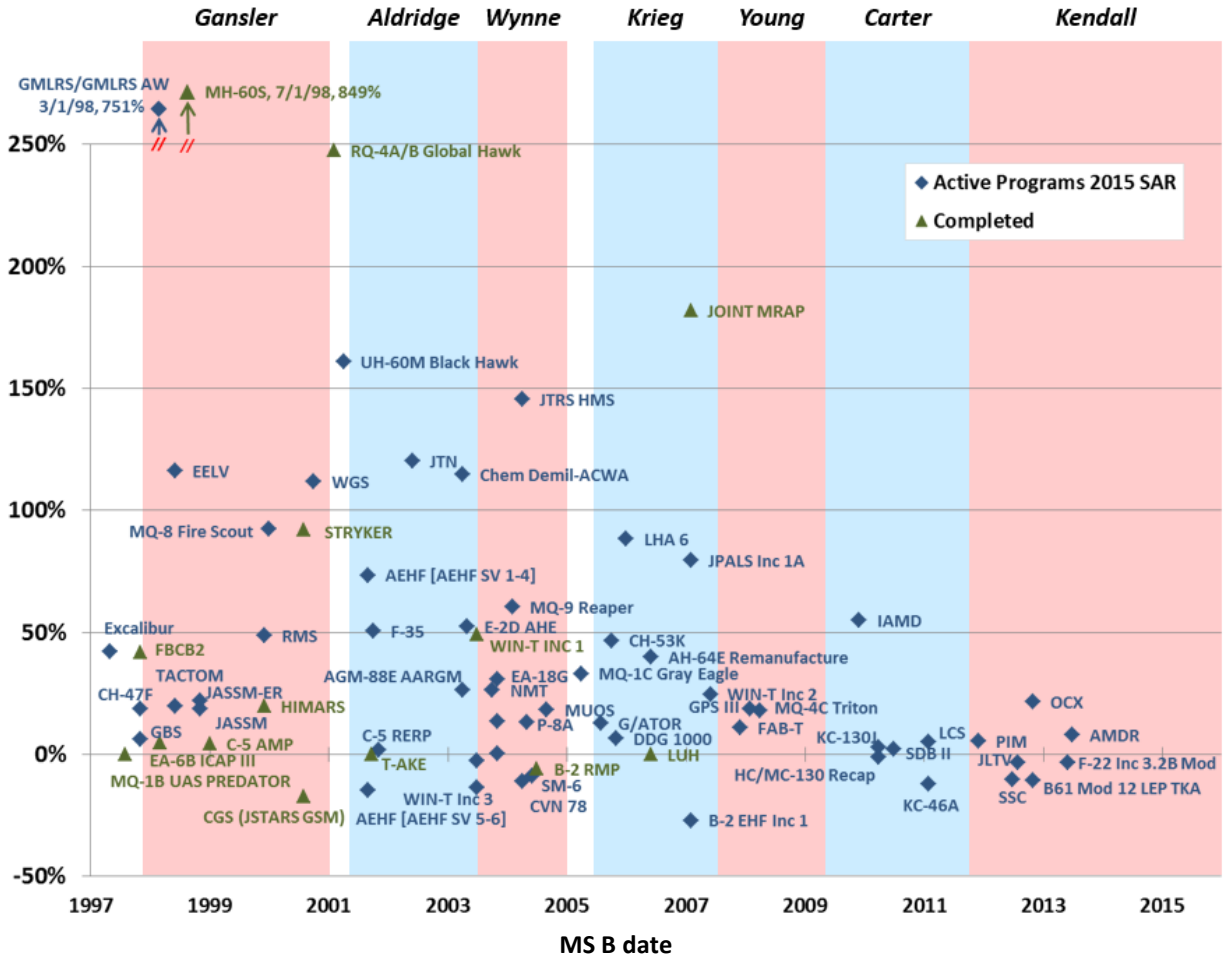
FUNDING GROWTH AND DAES

Policy, sound planning, and execution decisions by DoD executives should bear on the effectiveness of the overall acquisition system. This is particularly true for the program structure and associated baselines set at MS B against which future cost performance is measured. Therefore, in our annual reports we track the performance of programs started under different acquisition executives to help reinforce accountability and provide an initial look for possible trends for further analysis.

Figure H-1 and Figure H-2 show growth in MDAP[6] Planned Total Funding in development and procurement (respectively) for active[7] and completed MDAPs against original baselines as reported to Congress in the SARs. Note that SAR funding data reflect current PM estimates of total needs by the end of the program for the current program configuration, including past actual funding, the current budget request, planned funding in the Future Years Defense Program (FYDP), and planned funding beyond the FYDP to the end of the program. Growth is measured against the baseline set at the original MS B and can be positive or negative.

These figures also show who served as the DAE at the time of the MDAP's MS B approval. Later in the report we show similar charts for the programs started under different SAEs in the three military departments. (*See sections starting on pp. 12 and 69*).

These charts neither reflect the effectiveness of subsequent oversight or major program changes by later DAEs during execution oversight, nor do they reflect statistical analysis to control for other internal and external variables that could have led to a program's success or problems. Defense acquisition is complex, and each measure has its strengths and weaknesses, so attributing performance to a single measure is subject to the limitations of that measure. For example, some programs may appear to be performing well in terms of total planned RDT&E funding but may be having problems that are reflected in other measures (e.g., total needed procurement funding; estimated operational costs; or cost growth on one of the program's major contracts). Thus, a combined examination of available data is important before reaching conclusions. Nevertheless, they are a crude indicator of the effectiveness of the decisions made by these officials. *(See detailed discussion starting on p. 12.)*

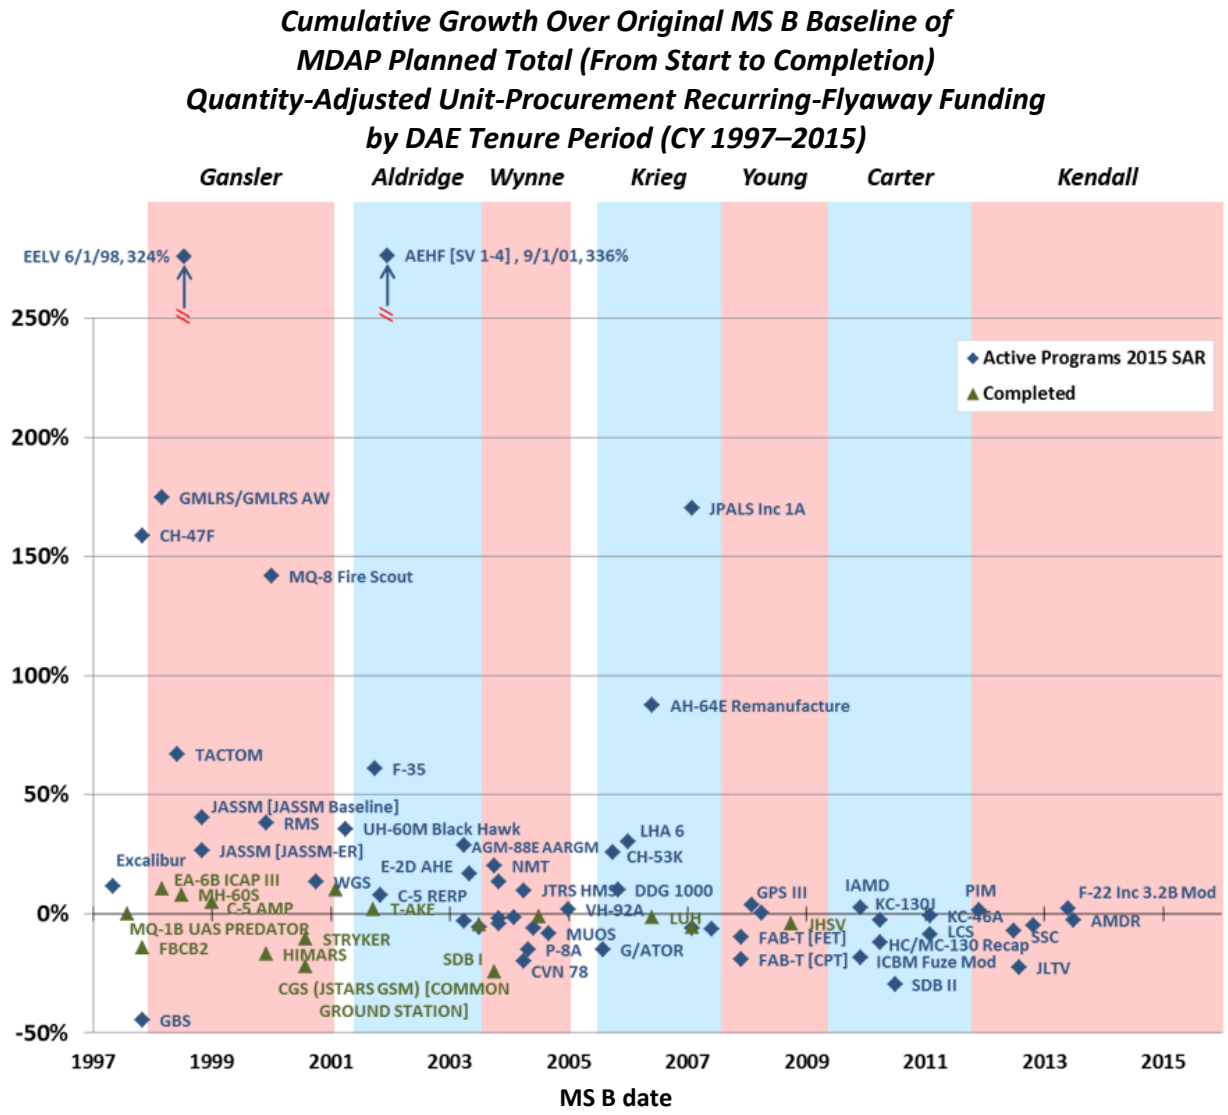


[6] MDAPs are DoD acquisition programs that are not highly sensitive (classified) and are either: (a) designated as such by the Secretary of Defense, or (b) estimated to require an eventual total expenditure for RDT&E of more than $480 million (in Fiscal Year [FY] 2014 constant dollars) or an eventual total expenditure for procurement (including all planned increments or spirals) of more than $2.79 billion (in FY 2014 constant dollars)—see 10 U.S.C., Section 2430(a), and USD(AT&L) (2015a, p. 44).

[7] In this report, *active* MDAPs are those that provide SARs and have passed MS B. MDAPs cease providing SARs and are deemed *completed* after they deliver 90 percent of total U.S. quantity or spend 90 percent of planned expenditures. See 10 U.S.C., Section 2432(g).

434 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

Figure H-1. Program Cost-Related Development Performance Baselined in DAE Periods



Cumulative Growth Over Original MS B Baseline of MDAP Planned Total (From Start to Completion) RDT&E Funding by DAE Tenure Period (CY 1997–2015)

NOTE: This shows total RDT&E funding growth independent of procurement funding and quantity changes; it reflects any work-content changes. These are percentage changes after adjusting for inflation from original MS B baseline of actual past and estimated future funding as reported in each program's latest SAR. Total RDT&E is an insightful measure because it is necessary, regardless of quantity. White bars between DAE shaded regions represent periods with no confirmed executive. Not shown are relatively new programs that have not spent at least 30 percent of their original EMD schedule. Program abbreviations are defined in Appendix F starting on p. 159.

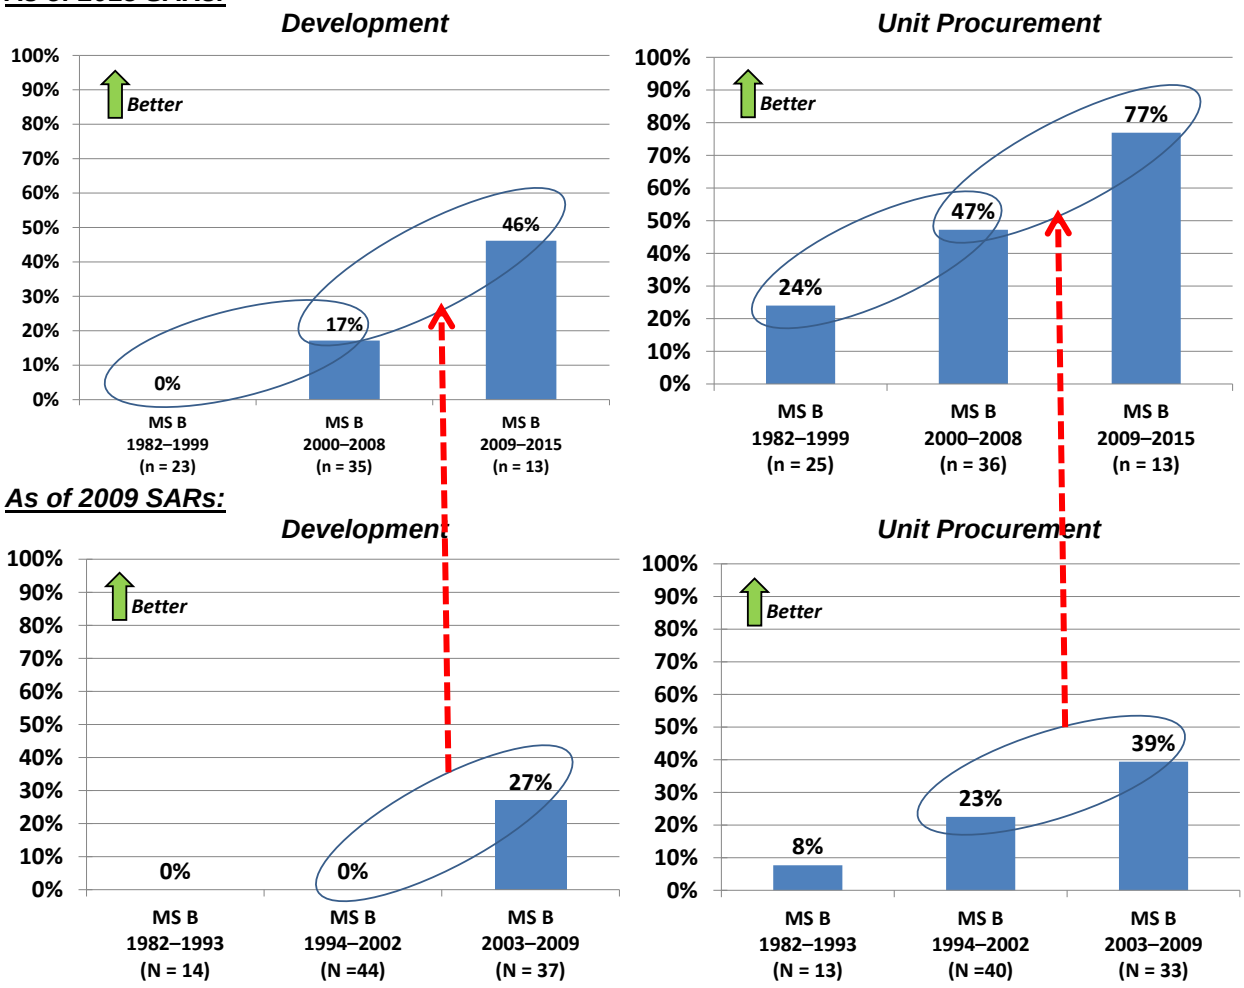
435 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

Figure H-2. Program Cost-Related Procurement Performance Baselined in DAE Periods

NOTE: This shows growth in total unit recurring flyaway needed funding after adjusting for quantity changes; it is independent of RDT&E funding but reflects any work-content changes. These are percentage changes after adjusting for inflation and any quantity changes from original MS B baseline of actual past and estimated needed future funding as reported in the programs' latest SARs. White bars between DAE shaded regions represent periods with no confirmed executive. Not shown are relatively new programs that have not spent at least 30 percent of their original EMD schedule. Program abbreviations are defined in Appendix F starting on p. 159.

436 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

COST-RELATED IMPROVEMENTS



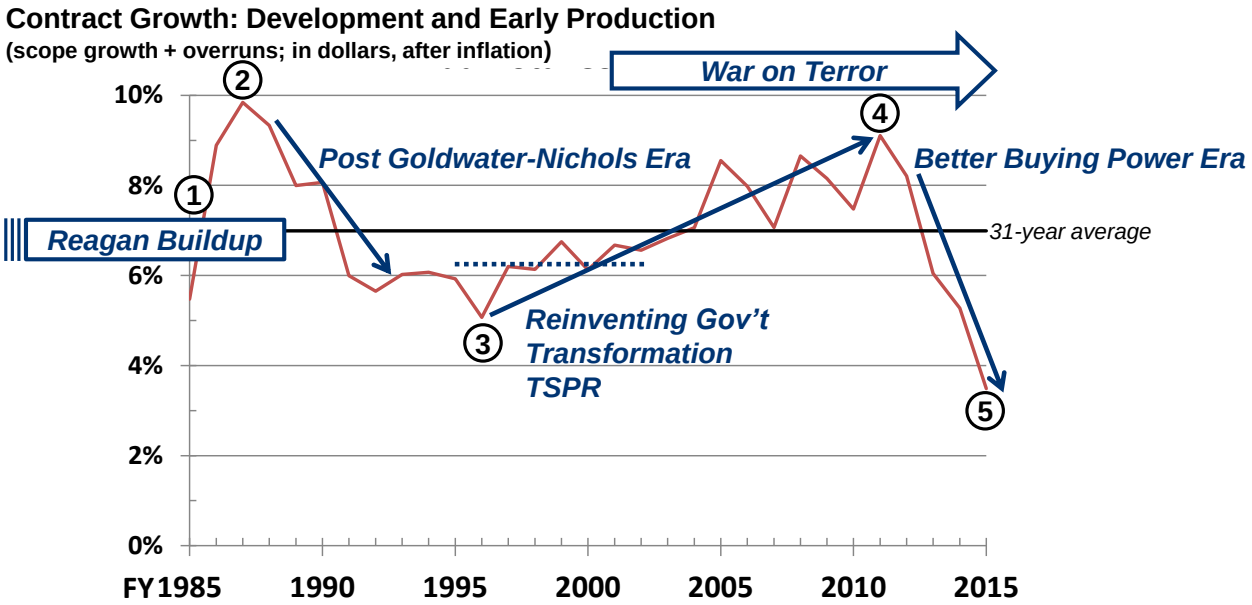
Recent data on MDAPs at the program- and contract-level have shown some statistically significant improvement trends in funding, price, and cost control, although complicating factors raise caveats and potential concerns.

More MDAPs are showing program funding reductions in both development and production. Relative to their original MS B baselines, more active MDAPs by proportion are estimated to have total RDT&E and unit-procurement funding reductions (sometimes referred to as "underruns") as of 2015 than as of 2009—even after we remove relatively new programs that would be unlikely to currently show growth (see Figure H-3). *(See detailed discussion starting on pp. 43 and 58).* The 2015 numbers are slightly lower than we saw last year in the 2014 data, but they remain significant. These data reflect similar results discussed below where biennial cost growth at the program level and the annual growth of contracted costs for MDAPs both have dropped significantly in recent years.

437 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

Figure H-3. Planned Reductions in Program Funding

Proportions of Active MDAPs With Reductions Since Original MS B Baseline in Cumulative Planned Total (From Start to Completion) Funding (2009 and 2015 SARs)



NOTE: Development funding is total RDT&E funding growth independent of procurement funding and quantity changes; it reflects any work-content changes and cost growth relative to targets. Procurement funding is growth in unit recurring-flyaway funding after adjusting for quantity changes; it is independent of RDT&E funding but reflects any work-content changes and cost growth relative to targets. Statistically significant differences between adjacent periods are marked with an oval. A program shows a reduction if current total is below the original MS B baseline. To reduce bias from newer programs, relatively new programs that have not been through at least 30 percent of their original EMD schedule are not included. MS B dates are calendar years.

Improved contract cost control beyond budgetary effects. The growth of contracted costs for major programs has dropped during Better Buying Power from 9 percent in fiscal year (FY) 2011 to a new 30-year low of 3.5 percent in 2015 (see Figure H-4). After accounting for budgetary effects, statistical analysis found an almost 2 percentage-point drop since 2012 and 1 percentage-point drop after Goldwater-Nichols and the Packard Commission recommendations were implemented. Analysis also found that the defense acquisition system adjusts in the future for unforeseen cost "shocks," dampening their effects. *(See detailed discussion starting on p. 83)*

438 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

Figure H-4. Actual Growth of Contract Costs (FY 1985–2015)

NOTE: Five-year moving average of annual growth in contracted total costs is shown relative to negotiated cost targets on major contracts of Major Defense Acquisition Programs (MDAPs), as well as MAIS that are MDAPs, in EMD and early production that reported earned-value (EV) data (i.e., almost no firm-fixed price or full-production contracts). This contract cost measure is *different* than statutory measures of program cost growth relative to baselines. Such changes reflect added work and overruns after adjusting for inflation. This measure should not be mistaken for the total costs of these programs because it excludes non-contracted costs and the majority of production contracts, which tend to be firm-fixed-price and do not report the data used for this analysis. These data summarize 18,470 EV reports on 1,123 major contracts for 239 MDAPs.

Program-level improvements. Table H-1 summarizes program-level results for MDAPs in development and procurement. Most (but not all) show improvement. For total RDT&E funding growth from original baseline, medians are still flat on a program basis but increasing on a dollar basis. In terms of quantity-adjusted unit procurement costs from original baseline, medians dropped 5 percentage points from SAR year[8] 2014 (on a dollar basis) and 2 percentage points (on a program basis). Biennially, medians are still flat since 2009 at about 0 percent. Note, however, that one measure (cumulative RDT&E growth from original baseline on a dollar basis) has a backlog of cost growth that will likely remain until those older programs exit the portfolio. We will discuss that later in this section.

[8] A *SAR year* includes information up until the SAR's submission date, which may reflect events and budgeting decisions from the beginning of the following calendar year (especially from January, when the budget request is being finalized). In other words, SAR years are similar to calendar years but may include data past December 31.

439 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

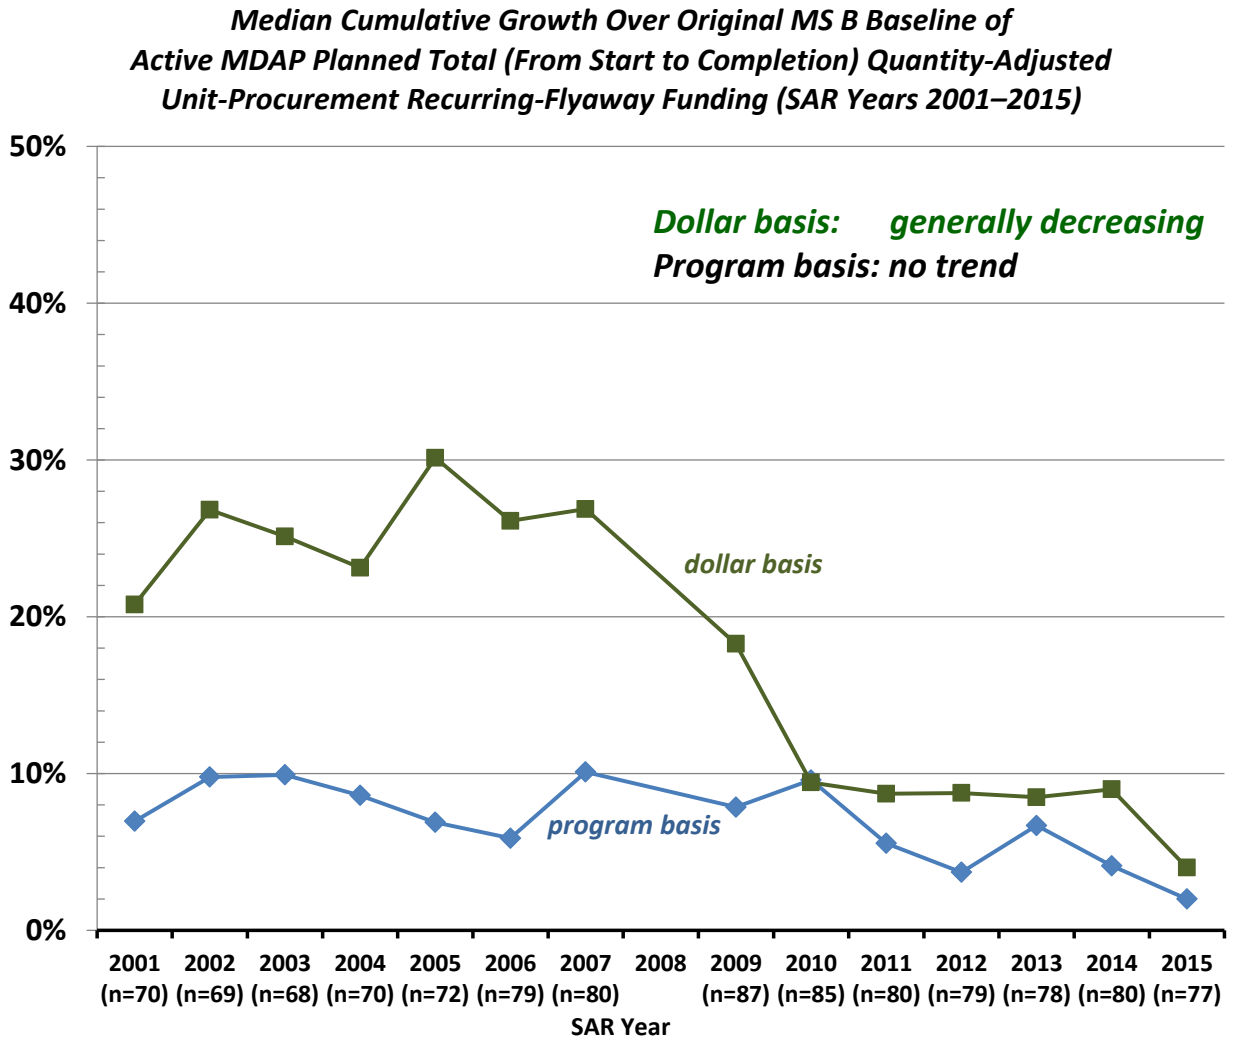


Table H-1. Changes in MDAP Cost Growth from 2014 to 2015 SARs

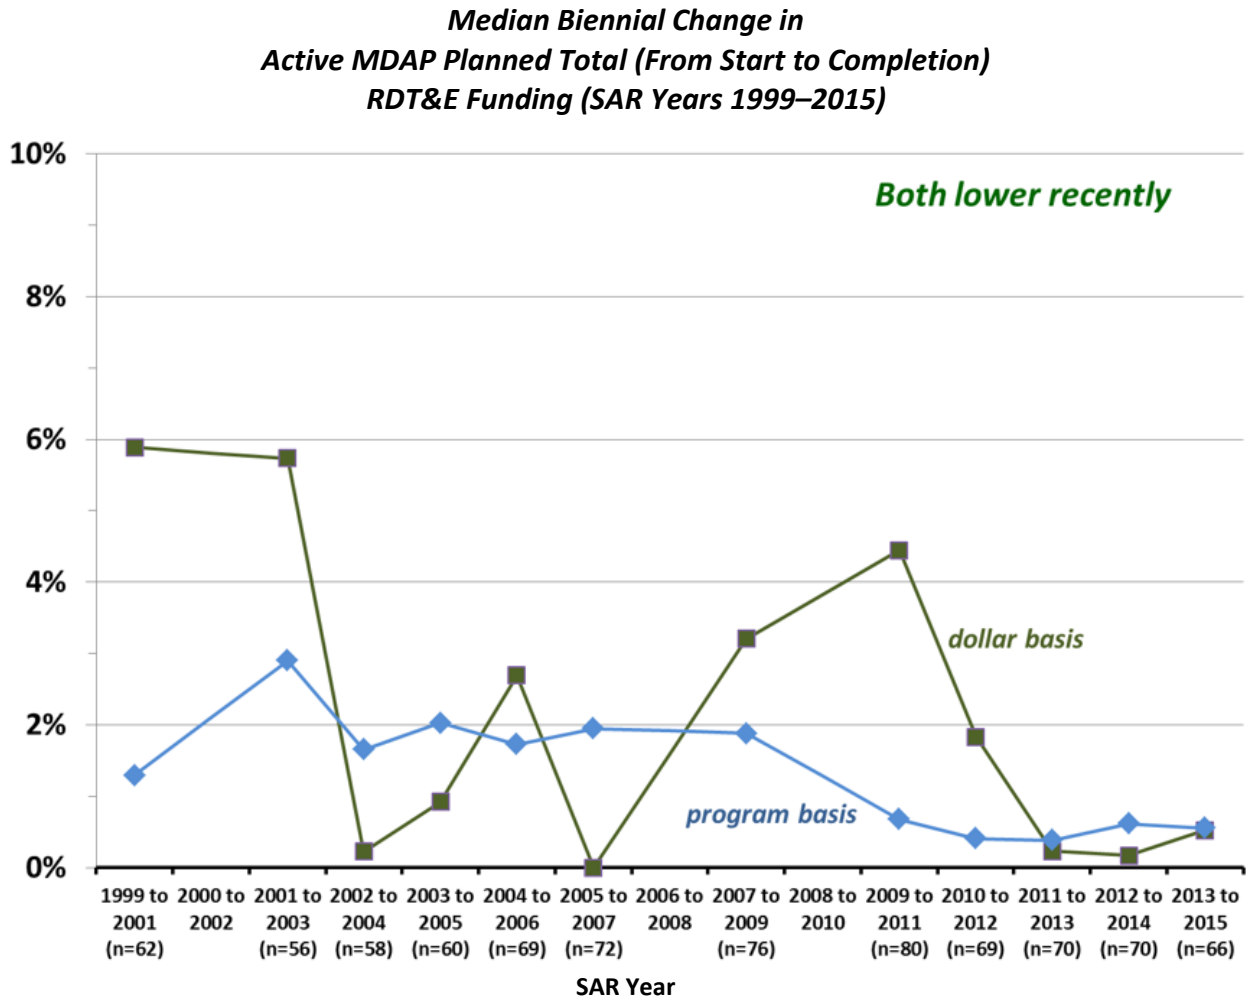
		Basis	(Change from 2014 to 2015 SARs)	
RDT&E		**Basis**	**Medians**	**Description**
Cumulative *(from original baseline)*		***Program***	19% → 19%	*flat*
		Dollar	45% → 49%	*still high*
Biennial		***Program***	1% → 1%	*flat*
		Dollar	0% → 1%	*slightly higher, but still very modest*
Procurement *(quantity-adjusted)*				
Cumulative *(from original baseline)*		***Program***	4% → 2%	*lower (apparent)*
		Dollar	9% → 4%	*lower (apparent)*
Biennial		***Program***	0% → 0%	*flat*
		Dollar	0% → 0%	*flat*

Lower total MDAP funding growth since original baselines in production. Adjusting for quantity changes and the dollar size of programs, the median quantity-adjusted unit funding growth since original MS B baseline has been statistically lower after 2009 and dropped further in 2015 (see the dollar-basis line in Figure H-5). On a program basis, the recent total unit funding appears somewhat lower at the median, but the population differences are not statistically significant (see the more detailed Figure 2-22). In other words, larger active MDAPs (by dollar) generally have brought their growth in total unit procurement funding needs to levels close to the median for all MDAPs regardless of size. Note that this is not the case in development, where increases are seen by program and dollar in recent years—see Figure H-16 below. *(See detailed discussion starting on p. 50.)*

440 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

Figure H-5. Program Cost-Related Performance: Procurement



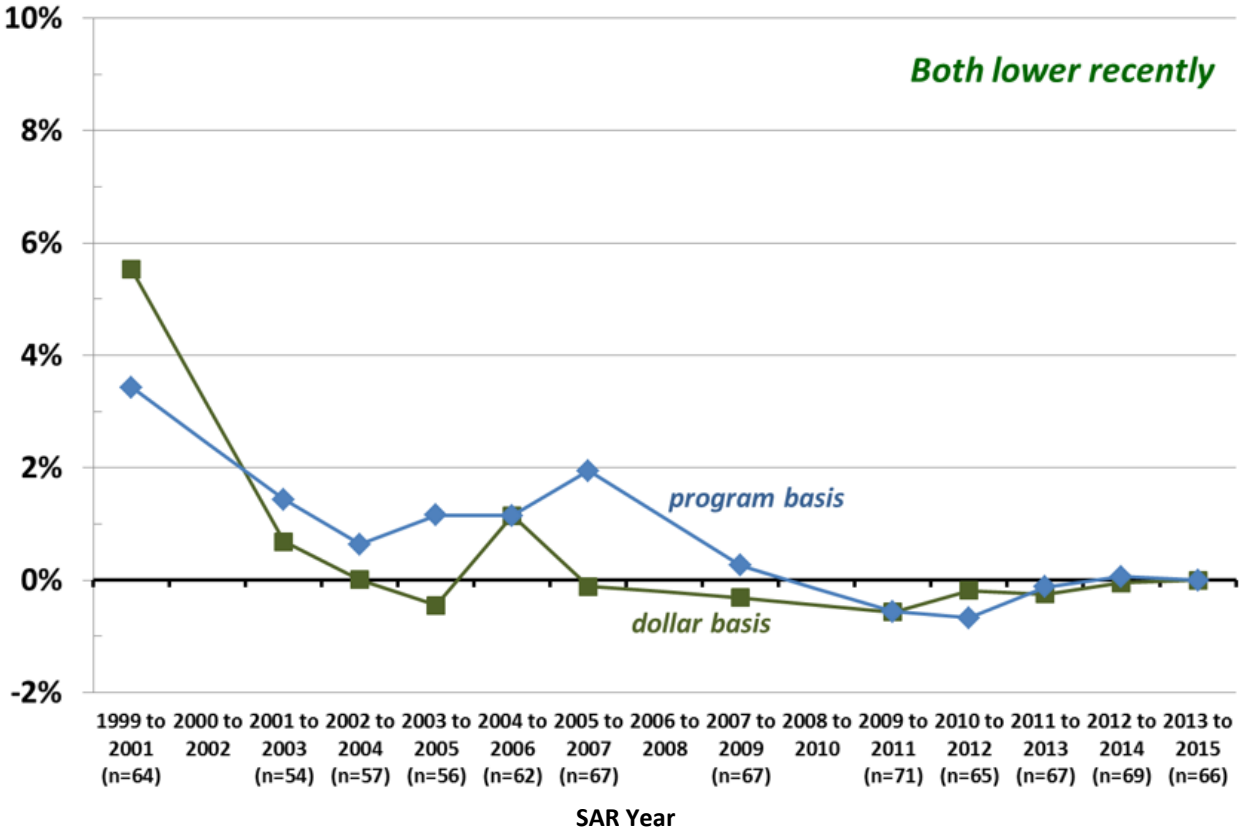
NOTE: This shows growth in unit recurring flyaway funding (i.e., for the production of a single usable end-item) after adjusting for quantity changes; it is independent of RDT&E funding but reflects any work-content changes. The trend on a dollar basis (weighting by program size) is statistically significant, but the lower results on a program basis (unweighted by dollar size) do not yet represent a statistically significant trend (see Figure 2-22 for details). These are percentage changes after adjusting for inflation and any quantity changes from original MS B baseline of actual past and estimated needed future funding as reported in the programs' latest SARs. Not included are relatively new programs that have not spent at least 30 percent of their original EMD.

Lower biennial change in MDAP program funding for both development and production. In addition to measuring total growth against original baselines, we also measure biennial growth to monitor incremental (marginal) growth. Median biennial change in funding growth continues to be lower in recent years both on a program basis and when adjusting for the size of programs (i.e., on a dollar basis)—see Figure H-6 and Figure H-7. In both program and dollar bases, biennial changes have been below 1 percent since 2011 for development and essentially zero or below since 2009 for procurement. These are measured using total program RDT&E funding and quantity-adjusted unit procurement (recurring unit flyaway funding), including past and needed future funding. *(See detailed discussion starting on pp. 40 and 54.)*

XXX

DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

Figure H-6. Program Cost-Related Biennial Performance: Development



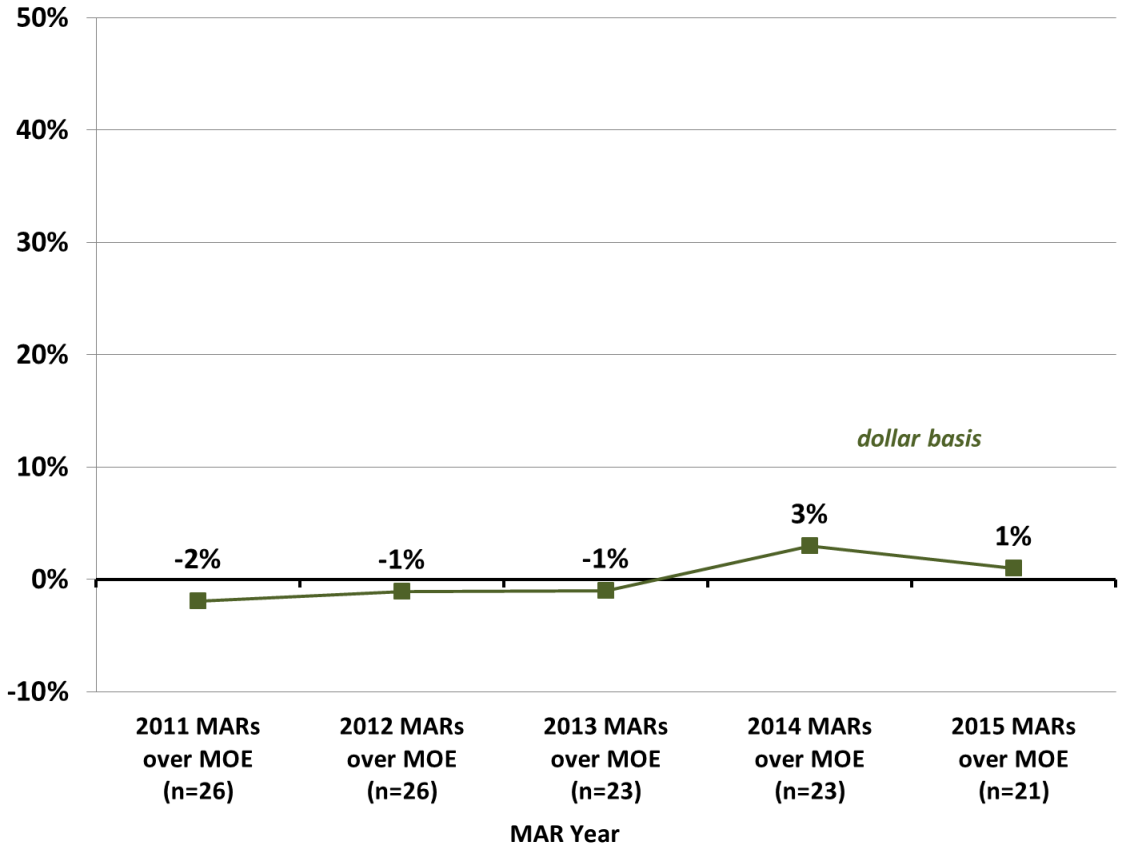
NOTE: This measures biennial changes in total RDT&E funding growth independent of procurement funding and quantity changes; it reflects any work-content changes. Both trends are statistically significant. Total RDT&E is an insightful measure because it is necessary, regardless of quantity. Relatively new programs that have not spent at least 30 percent of their original EMD schedule are not included. The dollar-basis value for 2010–2012 is higher than last year's report due to an error from not including 2011 F-35 fighter jet engine RDT&E dollars in 2010. Other slight adjustments in 2002–2004 and 2003–2005 reflect the addition of the Chemical Demilitarization (Chem Demil) programs to the dataset on program and dollar bases.

442 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

Figure H-7. Program Cost-Related Biennial Performance: Procurement

Median Biennial Change in
Active MDAP Planned Total (From Start to Completion)
Quantity-Adjusted Unit-Procurement Recurring-Flyaway Funding (SAR Years 1999–2015)

NOTE: This measures biennial changes in unit recurring flyaway funding after adjusting for quantity changes; it is independent of RDT&E funding but reflects any work-content changes. Indicated trends are statistically significant. Not included are relatively new programs that have not spent at least 30 percent of their original EMD schedule.



Lower median MAIS funding growth. As shown in Figure H-8, the median funding growth in the MAIS Annual Reports (MARs) compared to the MAR Original Estimate (MOE) dropped in MAR Year[9] 2015 after a small rise in 2014. Note that the magnitude of cumulative funding growth for MAIS programs is much smaller than those for MDAPs in development (Figure H-16) and production (Figure H-5). *(See detailed Figure 2-8 on p. 32 and associated discussion.)*

[9] MAR Years are analogous to SAR Years.

443 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

Figure H-8. Program Cost-Related Performance: Information Systems

Median Cumulative Growth Over Original Baseline of Planned Total (From Start to Completion) Funding for Active MAIS (MAR Year 2011–2015)

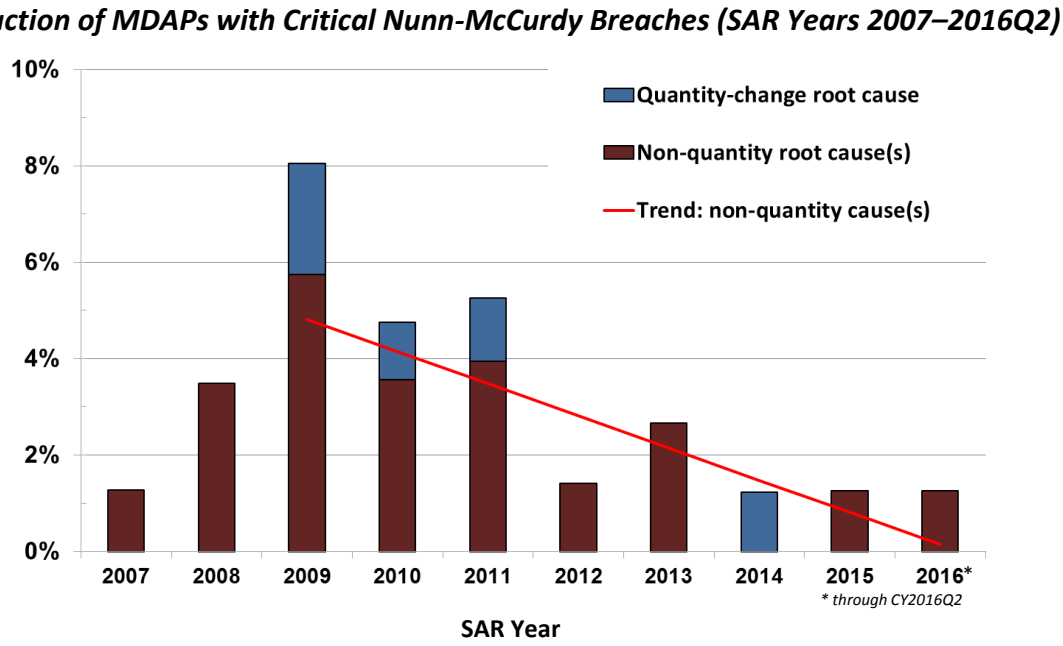
NOTE: Trends is statistically significant. Growth may reflect content changes. Immature programs that have not completed at least 30 percent of their original EMD schedule time were excluded to help control for maturity.

No penalties from new statutory overrun calculations on recent MDAPs. Section 828 of the FY 2016 National Defense Authorization Act (NDAA) (Public Law 114–92) enacted a new cost-growth calculation and associated penalty by military department across their MDAPs that started since 2009. Table H-2 summarizes the results for the 2014 and 2015 SARs. None of the military departments has net positive overruns and thus none of them incurred penalties for either of these years. We also note that each military department improved from its 2014 to 2015 SARs. *(See detailed discussion and data starting on p. 66.)*

444 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

Table H-2. Military Department MDAP "Overrun" Calculations and Penalties (SAR Years 2014–2015)

Department	2014 SAR Net Portfolio Overrun *(BY17$, B)*	2014 SAR Penalty	2015 SAR Net Portfolio Overrun *(BY17$, B)*	2015 SAR Penalty
Army	−0.5	$0	−3.9	$0
Navy	−2.9	$0	−4.0	$0
Air Force	−25.3	$0	−30.0	$0



NOTE: "Overruns" in this case are defined (by Section 828 of the FY 2016 NDAA relative to original PAUC baselines at current total quantities. To aid comparison between the two years, all dollars are converted to a common FY 2017 base year (BY) and rounded to the nearest $100 million.

Lower recent rates of Nunn-McCurdy breaches. As shown in Figure H-9, there have been statistically significant downward trends since 2009 of both nonquantity-related critical breaches (shown) and all critical Nunn-McCurdy cost-growth breaches.[10] *(See detailed discussion and data starting on p. 22.)*

[10] Nunn-McCurdy "cost" growth thresholds are established by law and trigger reporting to Congress and other specific actions by the DoD (see discussion starting on p. 19). As discussed earlier with respect to PAUC, these "cost" measures reflect funding and include the underlying contractor and government execution costs plus contractor margins (profits and fees).

445 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

Figure H-9. Program Cost-Related Performance: Nunn-McCurdy Breaches

NOTE: This chart includes data through CY 2016Q2, which is the second quarter of CY 2016, inclusive. Breaches due to quantity changes are based on Performance Assessments and Root Cause Analyses (PARCA) root-cause analysis or review of information from the program's DoD Component. JSOW has been recategorized as quantity related (a change from last year's report). Since PARCA was not established until the Weapon System Acquisition Reform Act (WSARA) of 2009, it is unknown whether quantity changes were a root cause of breaches before 2009. There is a statistically significant downward trend in both total critical breaches and non-quantity-related critical breaches since 2009. Cost breaches are after adjusting for inflation. Since it usually takes a few years before a program might breach again, we removed programs from the portfolio count that have breached recently to avoid the potential bias toward an artificially low breach rate (i.e., this adjustment makes the metric more conservative). Also, relatively new programs that have not spent at least 30 percent of their original EMD schedule are not shown. For the trend analysis, we used the breach rates instead of counts to control for changes in portfolio size between years, although the patterns are very similar because the size of the MDAP portfolio is relatively stable.

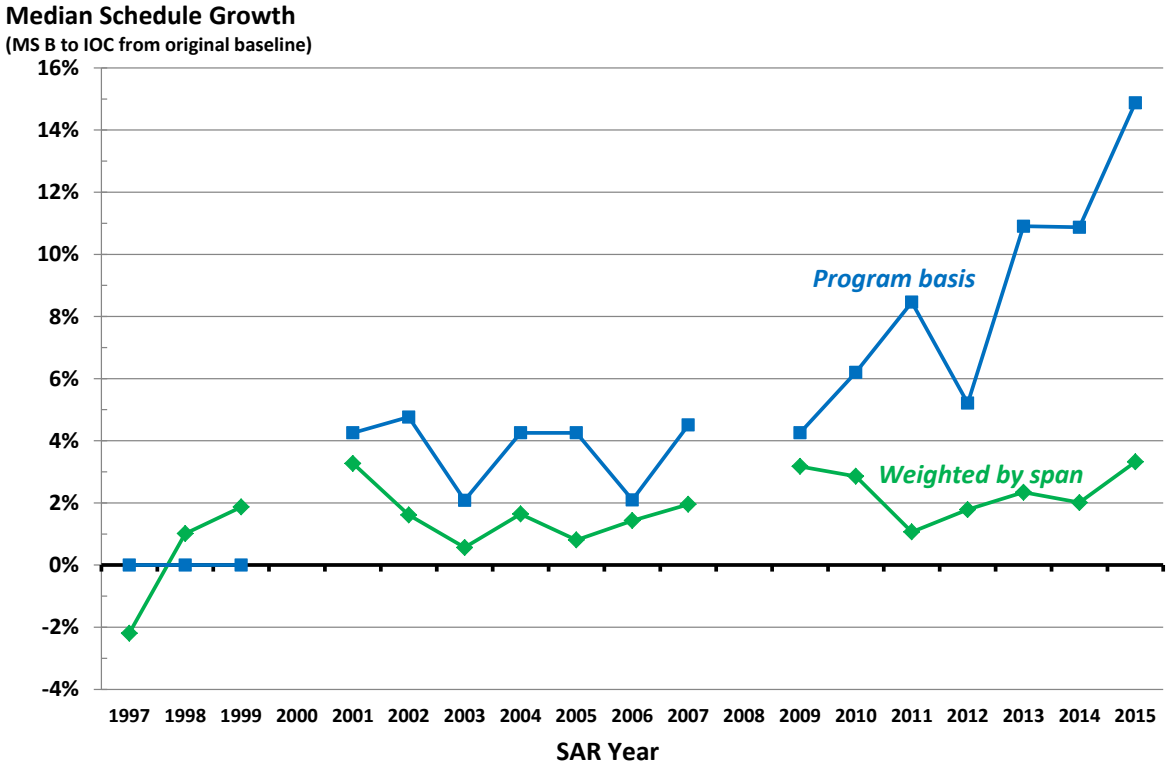
SCHEDULE-RELATED PERFORMANCE

While cost growth eventually affects warfighter capabilities through opportunity cost effects on quantity and other programs, schedule growth directly delays the delivery of capabilities that address operational needs and threats. Thus, we are expanding our analysis of schedule-related performance to look for trends in cycle time and schedule growth. As with cost, schedule-related metrics vary depending on what is included (e.g., whether active or incomplete programs are included, raising questions of remaining maturity bias) and how they are calculated (e.g., whether in years relative to baselines or in percentages of growth, the latter of which are not symmetrical around 0 percent).

The following schedule-related metrics show mixed performance; some show increases while others show zero or negative growth. Generally, the magnitudes of any changes are lower in percentage than cost growth relative to baselines.

Historical MDAP schedule growth shows no trend in time. When measuring schedule growth from MS B or C to IOC by start date, we saw no significant trend across all MDAPs. In other

446 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING



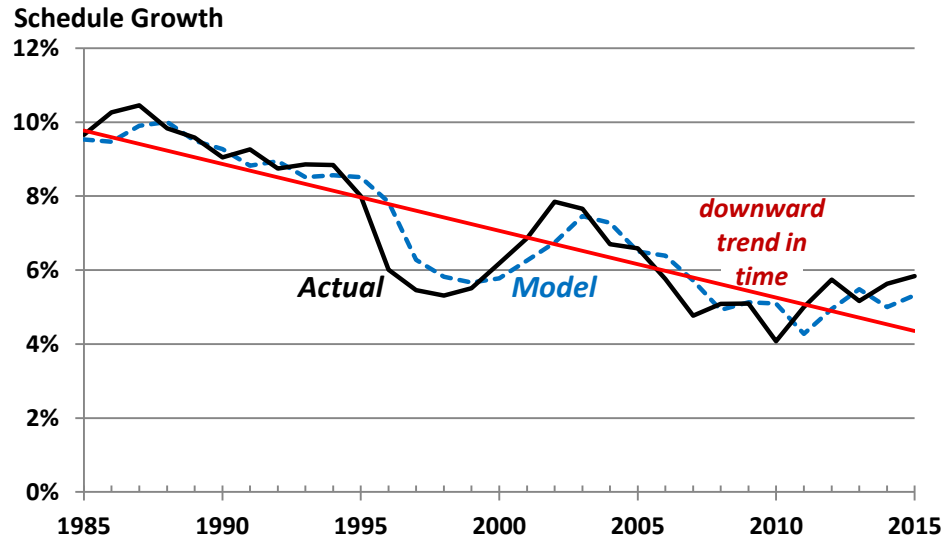
words, essentially no part of the variation is explained generally by a trend in time. The median overall growth since 1981 is 1 percent (up from 0 percent last year). We do see a downward trend in the subset of programs that have not yet achieved IOC, but it is too early to tell whether the trend is real or are merely due to the fact that the programs are not yet complete. *(See discussions starting on p. 46.)*

MDAPs have averaged about 7 years to reach IOC, showing about 3 percent growth overall. The average MDAP that reported between calendar year (CY) 1997–2015 took about 7 years to reach IOC from initiation at MS B or C. This is about 3 percent above the average planned length. The actual portfolio variation (standard deviation) grows by about 5 months. In other words, the portfolio of programs that have achieved IOC showed modest schedule growth, measured in months, not years. *(See discussion starting on p. 45.)*

Recent median schedule growth on active, shorter MDAPs is increasing. In a different measure examining all then-active MS-B-start programs (regardless of whether they have reached IOC or not), we have seen a marked increase in schedule growth from program start (MS B) to IOC from about 4 percent to about 15 percent at the median on programs since 2009 on a program basis (see Figure H-10). Schedule growth across the distribution in CY 2015 was statistically higher than it was in 1997–1999 and 2004–2005. However, when weighting by program span (so that longer programs weigh more than shorter programs), the trend remains relatively flat at about 2 percent. Thus, recent schedule growth (in percent) on active programs generally appears to be concentrated on shorter programs. We also found (in separate analysis) that shorter programs tended to have higher schedule-growth percentage variation than longer programs. *(See discussion starting on p. 46.)*

447 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

Figure H-10. Median MDAP Schedule Growth for Active Programs (SAR Years 1997–2015)



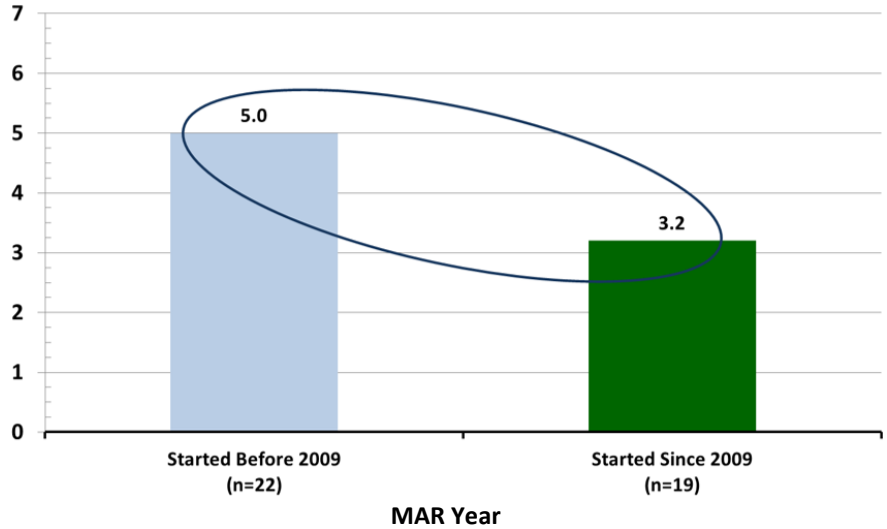
NOTE: Program basis weighted each program equally. Schedule growth on a program basis across the distribution in CY 2015 was statistically higher (at the 5-percent level of significance) than it was in 1997–1999 and 2004–2005. Weighting by span increases the contribution of longer programs relative to shorter programs (analogously to weighting cost growth by the dollar size of a program). There were no complete SARs in 2000 and 2008 due to changes in presidential administrations. No programs that started at MS C are included.

MDAP development contract length has grown slowly with system complexity. In comparison to program schedules, when examining development contracts for MDAPs we also see a cycle time of about 7 years. Historically, contract cycle time has grown since 1980 (when it was about 4 years and we had many large overruns on programs in the 1970s) through the 1990s (when it was about 5 years) to the present level of about 6.5 years since about FY 2002. These increases are commensurate with data from our prior reports and probably reflect increases in system complexity and capabilities over the last 35 years. *(See discussions starting on p. 60.)*

Schedule growth is declining on major MDAP contracts. In contrast to program-level data, major development contracts for MDAPs are showing a statistically significant decline since 1985. Our model also shows that any random deviations from this trend are corrected in later years, preserving the trend. Figure H-11 shows that this analytic model closely fits the actual data. *(See discussion starting on p. 61.)*

448 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

Figure H-11. Contract Schedule Growth (FY 1985–2015)

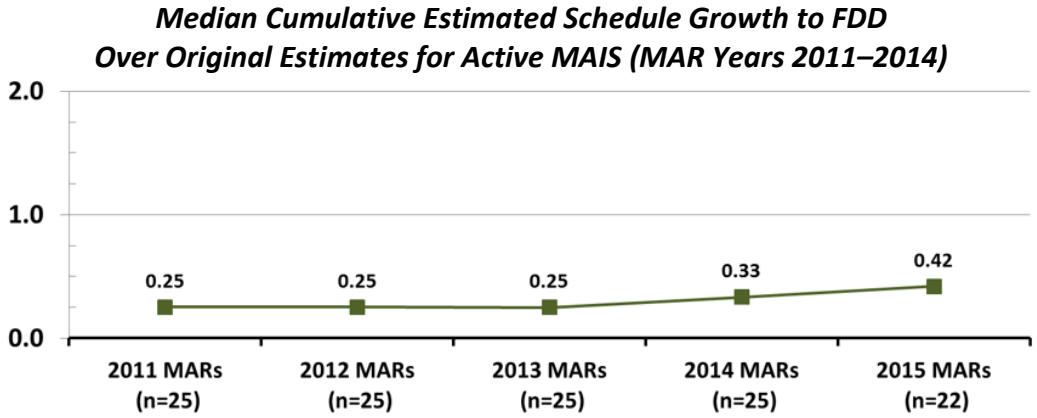


NOTE: 18,470 earned-value reports on 1,123 major contracts for 239 MDAPs.

Median MAIS cycle time is lower. MAIS cycle time is particularly important given the fast pace of information technology advancement. Here cycle time is measured from either MS B or Funds-First-Obligated (FFO) to the Full-Deployment Decision (FDD). As shown in Figure H-12, the median cycle time as reported in the MARs dropped from 5 years before 2009 to 3.2 years since 2009; this result is unchanged from last year's report. Further data and analysis are needed to determine whether we are faster at acquiring MAIS or are planning MAIS in smaller increments. *(See detailed Figure 2-21 on p. 49 and associated discussion.)*

Figure H-12. Program Length: Information Systems

Median Originally Estimated Cycle Time for Active MAIS (2011–2015 MARs)



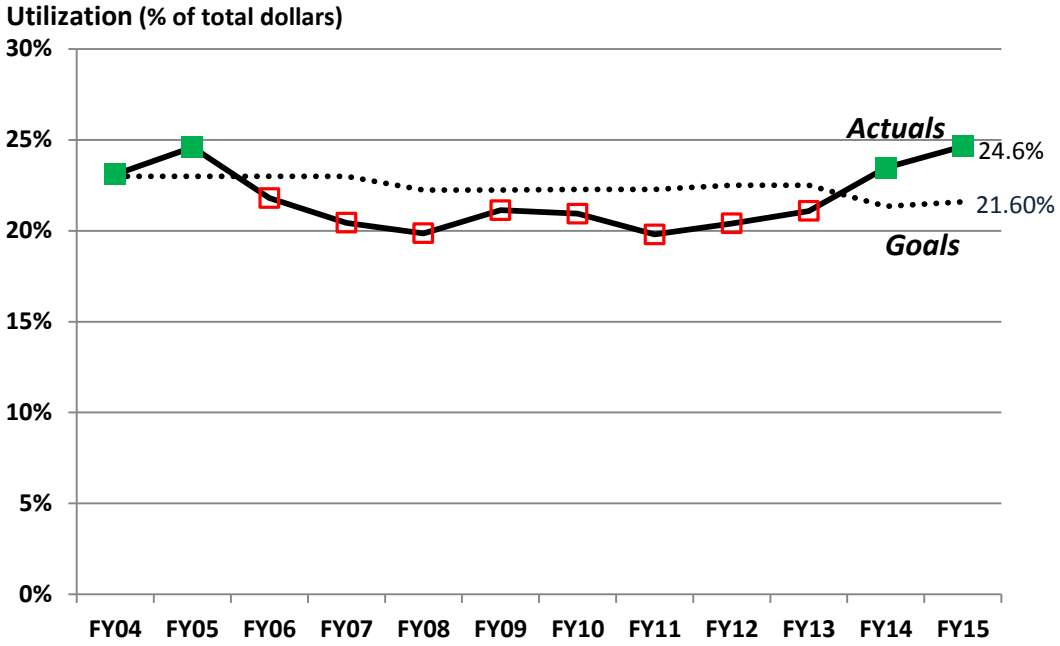
NOTE: These changes may reflect systemic reductions in how much work is included in an MAIS. Original estimates are those in the MAIS' first MAR. Included are the latest data on programs that appeared in at least one MAR from 2011 through 2014. Relatively new programs that have not spent at least 30 percent of their original EMD schedule are not included.

449 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

MAIS program schedule growth. We also track MAIS schedule growth to understand actual execution. As shown in Figure H-13, the median schedule growth across then-active MAIS programs has increased slightly from 3 months in 2011 to 5 months in 2015. Again, further data and analysis are needed to determine whether MAIS programs are executing well relative to plans or if requirements and work content are being adjusted to keep programs close to original schedules. *(See detailed discussion on p. 30.)*

Figure H-13. Program Schedule Growth: Information Systems

NOTE: These measures do not control for any changes in work content or specifications. Original estimates are those reported in the first MAR for each MAIS. Schedule period is from MS B or FFO to FDD. Relatively new programs that have not spent at least 30 percent of their original EMD schedule are not included



Improvements in Institutional Inputs

Acquisition workforce capability and quality improvements. Workforce professionalism is central to the performance of the defense acquisition system. With strong support from Congress, we have made strides in improving the capabilities, qualifications, demographics, and leadership of the workforce through various strategic initiatives. The workforce grew by about a quarter after FY 2008 when it was recognized that the DoD had serious deficiencies in this area. This growth was stopped as budgets declined after 2011, but since then the size of the workforce has remained roughly constant. Quantity (the number of people) alone is insufficient. We now focus on improving the quality, experience and professionalism of the workforce. The percent of the workforce lacking certifications has dropped from 14 percent in FY 2008 to 3 percent in the first quarter of FY 2016. We have reduced a significant shortfall in late mid-career staff through strategic hiring. Finally, board-certification has articulated and applied advanced quality standards for many categories of key acquisition leaders. *(See further discussion starting on p.* 119*.)*

Increased small-business utilization on prime contracts. Figure H-14 shows actual DoD-wide small-business utilization (measured as a percentage of dollars obligated) relative to yearly goals. At the prime contract level, recent trends since FY 2011 have been steadily improving; we exceeded our FY 2014 and FY 2015 goals by 2.1 and 3.0 percentage points, respectively, surpassing all prior years except FY 2005. *(See further discussion starting on p. 135.)*

450 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

Figure H-14. Small-Business Prime Contracting Utilization Trends: Goals and Actuals (FY 2001–FY 2015)

NOTE: Closed green squares indicate that the goal for that fiscal year was achieved; open red squares indicate that the goal was not achieved.

WHERE IMPROVEMENT IS NEEDED

While progress has been made in a number of performance measures, improvement is flat or could be improved in others.

Initial operational test ratings remain about the same. The whole reason we have defense acquisition is to provide operational capabilities to our warfighters against current and evolving threats. Cost and schedule control are important, but more important is the relative value of operational benefits given costs. Operational performance goes beyond merely meeting technical requirements established before program inception. Threats can change and those initial requirements may lag operational aspects important to performance in the field. One measure of performance is the operational test results reported by the DoD Director of Operational Test and Evaluation (DOT&E) at the end of LRIP. These initial operating tests, often referred to as Beyond-LRIP (BLRIP) tests, provide independent data on the operational effectiveness and suitability of the system at this point.

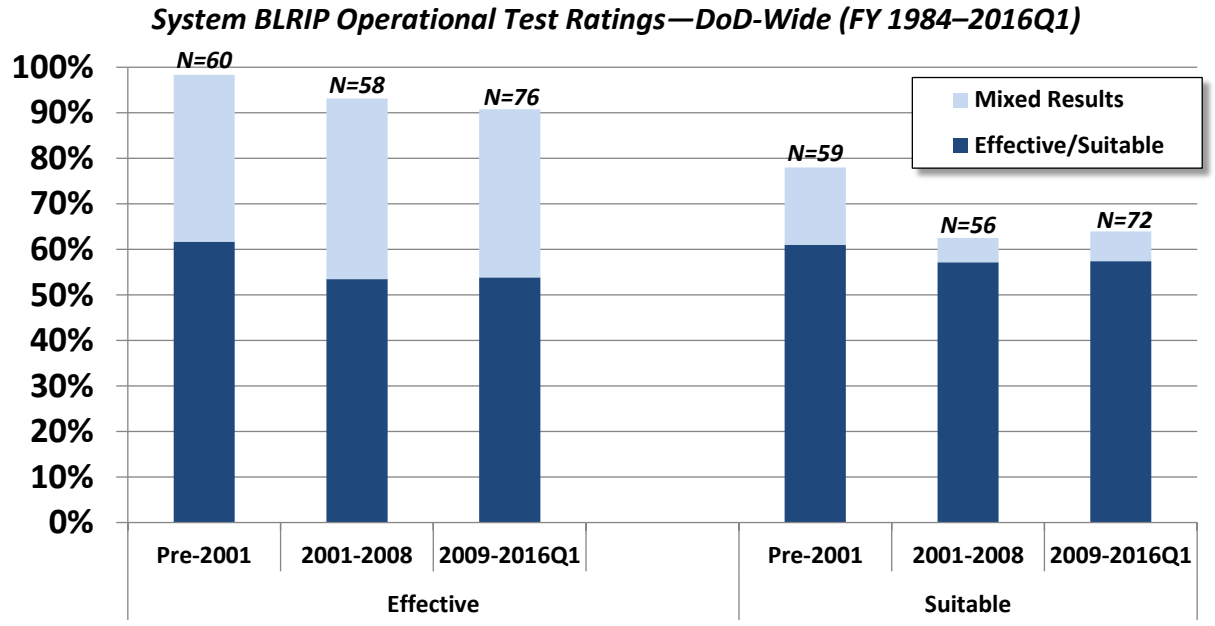


Figure H-15 summarizes the results of these BLRIP operational tests. While the absolute percentages are slightly lower, the differences between the time periods are not statistically significant, and we are not able to distinguish statistically significant differences based on the incumbent DOT&E. Further analysis discussed in the report found that a program is fairly likely to test out as effective if it tested as suitable, but the converse is not true. In other words, we have a number of effective programs that revealed issues with safety, interoperability,

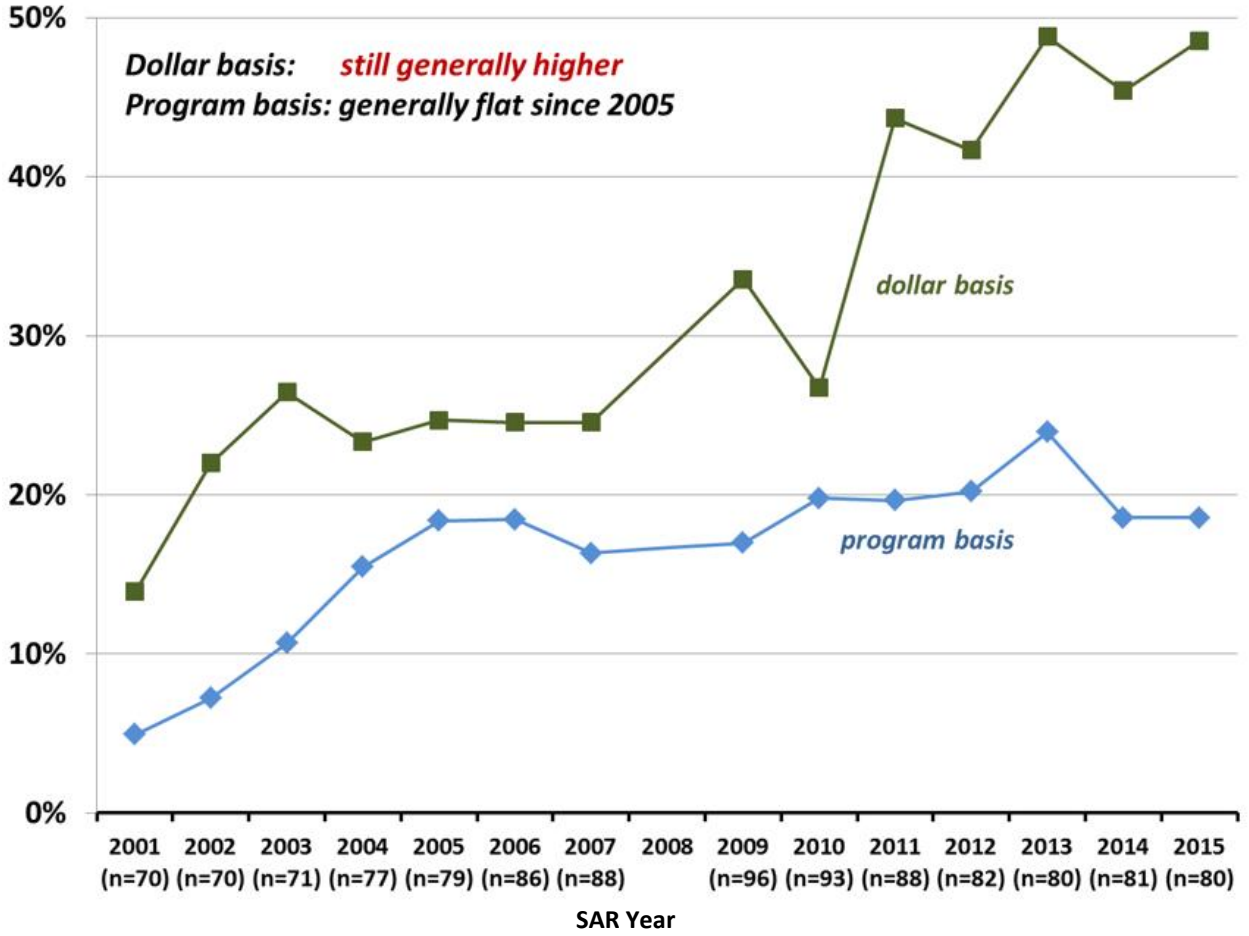
451 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

availability, maintainability, and reliability. However, systems that demonstrated suitability also tended to be effective against threats. *(See detailed discussion starting on p. 16 and 62.)*

These data do not reflect subsequent remediation of the issues found during operational testing. Structured data on subsequent operational tests have a much lower sample size and showed no obvious trends. Note, however, that any remaining limitations are subject to tradeoff decisions that weigh remediation cost and performance factors against the benefits of early introduction of advanced capabilities.

Figure H-15. System Operational Test Performance



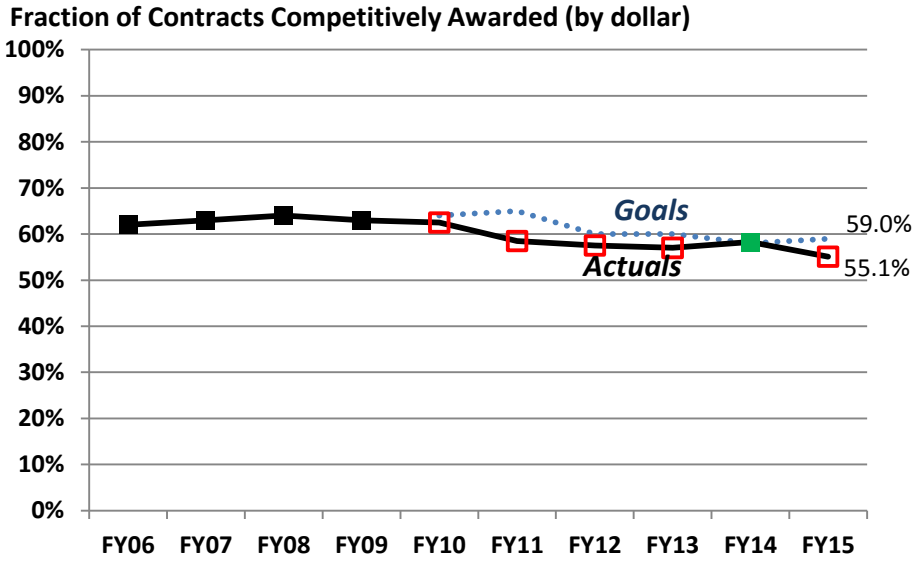
Source: DOT&E BLRIP reports.
NOTE: Differences are not statistically significant. Sample sizes differ between Effective and Suitable for some DoD Components because effectiveness and suitability could not be determined in all cases.

Higher total MDAP RDT&E funding growth since original baselines. While biennial changes in total planned and actual RDT&E funding growth has been decreasing recently (see p. xxx), cumulative RDT&E funding over original MS B baselines continued its increase since 2001 on a dollar basis but has been statistically flat since 2004 on a program basis (see Figure H-16). Since recent biennial changes in planned and actual total funding have been near zero at the median, this metric is unlikely to reverse (even if no more RDT&E growth occurs) until programs with earlier RDT&E growth (e.g., the F-35, which had significant historical development cost growth but has been stable since the Nunn McCurdy breach in 2010) exit the MDAP portfolio. Negative growth would be required to reduce this metric, absent programs dropping out of the dataset. *(See detailed discussion starting on p. 35.)*

452 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

Figure H-16. Program Cost-Related Performance: Development

Median Cumulative Growth Over Original MS B Baseline of Active MDAP Planned Total (From Start to Completion) RDT&E Funding (SAR Years 2001–2015)



NOTE: This shows total RDT&E funding growth independent of procurement funding and quantity changes; it reflects any work-content changes. Both trends are statistically significant. These are percentage changes from original MS B baseline after adjusting for inflation of actual past and estimated future funding as reported in each program's latest SAR. Total RDT&E is an insightful measure because it is necessary regardless of quantity. Relatively new programs that have not spent at least 30 percent of their original EMD schedule are not included. The dollar-basis value for 2010 is lower than last year's report due to an error in double counting the F-35 engine RDT&E dollars in that year. There are also slight corrections in 2002–2003 on a program basis adding the Chem Demil program and in 2014 to include three subprograms to the dataset.

Competition rates are falling. Figure H-17 plots the percentage of all DoD contract dollars that were competitively awarded from FY 2006 to FY 2015. Since goals were established in FY 2010, we had declining actuals until we made progress in FY 2014 at reversing the trend. However, competition rates declined again in FY 2015 despite an increased goal and strong management emphasis by the DAE through the Business Senior Integration Group for that year. Major drivers of this trend are high-value sole-source Foreign Military Sales, fewer new program starts, and higher percentages of the MDAP portfolio (e.g., shipbuilding and aviation programs) in

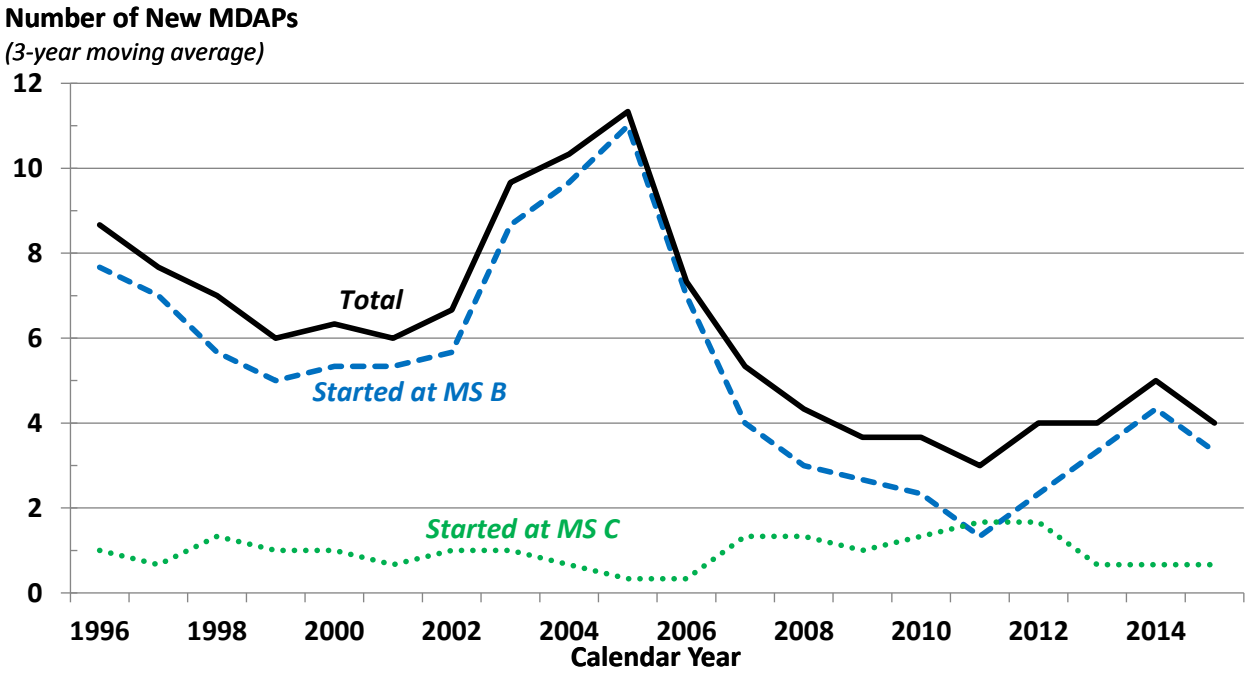
453 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

production and thus sole or dual sourced. Increased bid-protesting also forces us to award sole-source contracts to bridge until we can let the new contract awards. We anticipate continued challenges from fiscal uncertainties, but this will remain an area of management focus. *(See detailed discussion starting on p. 135.)*

Figure H-17. Competition Trends: Goals and Actuals (FY 2006–2015)

NOTE: Fraction of contracts competitively awarded is measured on a dollar basis. We did not establish goals until FY 2010. Open symbols indicate that the subcategory goal for that fiscal year was not achieved. Closed green symbols indicate that the subcategory goal was achieved for that year.

Subcontracting utilization of small businesses. As shown in Figure H-14 on p. xl above, small-business utilization on subcontracts to our prime contractors has been declining since FY 2010. We have missed the goals for the past 4 years. To address this trend, the DoD continues to apply statutory procedures wherein contractors who fail to comply in good faith with the requirements of their small-business subcontracting plans are in material breach of their contracts and are subject to liquidated damages (see the Federal Acquisition Regulation [FAR], Section 19.7). We also emphasize the importance of small-business subcontracting with senior management at our major primes when reviewing their institutional performance. In addition, we are modifying our acquisition strategies to further open up competitions on components for our large weapons systems.



Other Observations

Technical superiority concerns continue. Declining investments in both RDT&E and production (see Figure 1-4 on p. 4) at a time of accelerating threats is delaying and limiting development and production of superior capabilities in quantities that are operationally relevant. Also, trend analysis of RDT&E budget activities (BAs) supports our concern that budget reductions are affecting new system development, which constitutes the programs in the DoD's new product pipeline. BA 6.5 (System Development and Demonstration, which supports programs after MS

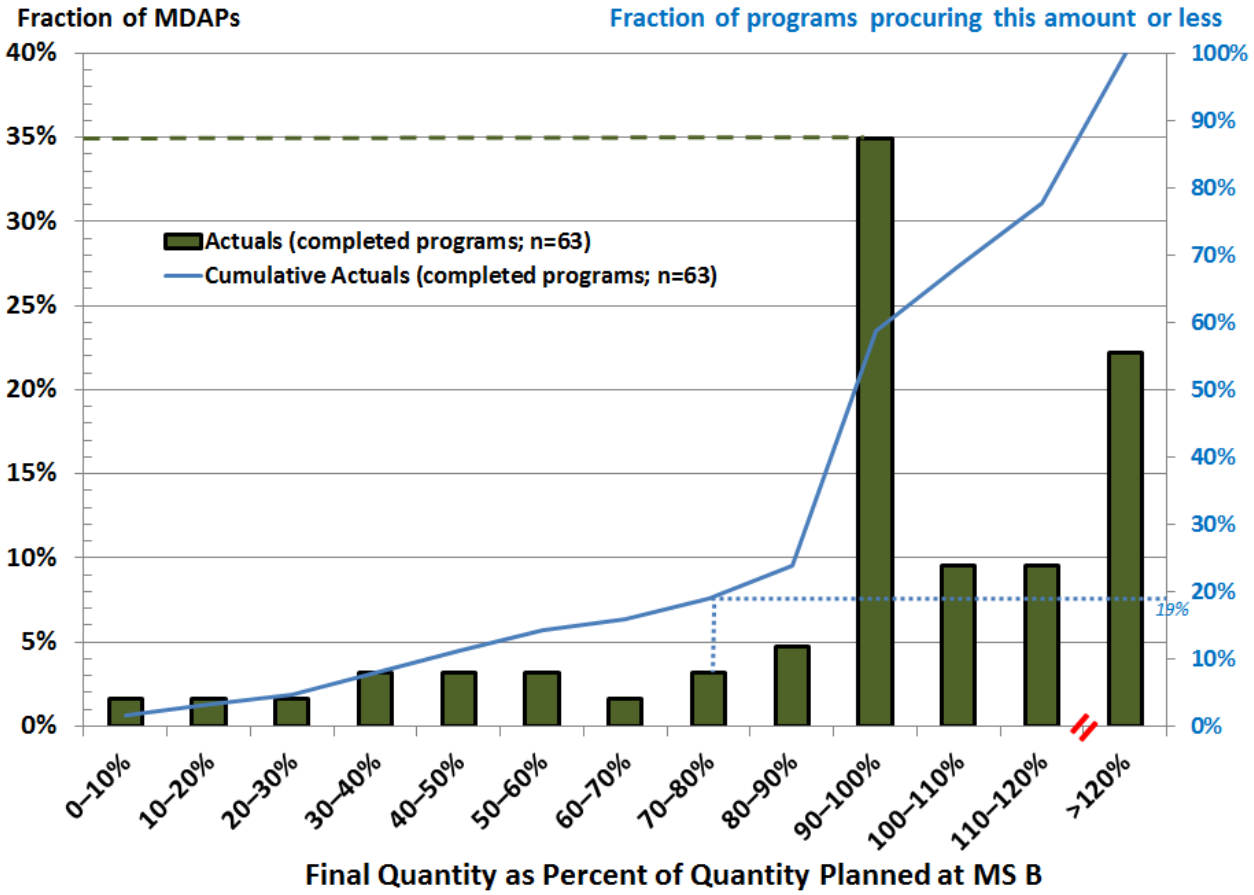
454 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

B) drops below BA 6.4 (Advanced Component Development and Prototypes) after FY 2014 (see Figure 1-5 on p. 5) instead of being higher. As part of the Third Offset Strategy and consistent with BBP 3.0, the DoD is increasing its investments in BA 6.4 by funding a number of risk-reduction prototype programs. Without funds to continue these efforts into the more expensive BA 6.5 phase to further develop the systems for production, these demonstrations will not result in fielded capabilities. Figure H-18 also shows that the number of new MDAPs has dropped in recent years to about half of what we saw in the mid-1990s and two-thirds of the peak in the mid-2000s.

Figure H-18. Frequency of New MDAP Starts: 3-Year Moving Average (CY 1996–2015)

NOTE: Dates were extracted from CY 1997–2015 SARs, with MS start dates in 1994–1996 extracted from the 1997 SARs. The data points for 1996 reflect the average for calendar years 1994–1996.

MDAP requirements are relatively stable. Preliminary analysis of performance requirements in unclassified baselines and SARs indicate that about 15 percent of 121 MDAPs showed requirements changes that we could trace from the original MS B baseline to the latest SAR for the program. Most of the programs with any traced changes had only one such change. For cases in which we could judge a change as more or less stringent,[11] about half of more stringent requirement changes were in a single program (FMTV, a ground vehicle), and half of the less-stringent changes were in the (subsequently canceled) NPOESS satellite program. Further



[11] As opposed to additions, deletions, or cases where it is not readily clear whether the change is harder or easier to implement.

455 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

analysis is needed, but for the most part system requirements appear to be stable. (*See detailed analysis and discussion starting on p. 100.*)

Most MDAPs deliver the original baseline quantity or more. Figure H-19 shows the actual number of units procured by completed MDAPs over the last 19 years. More than 80 percent of programs delivered at least 80 percent of their originally planned units, and just over 40 percent of programs delivered more than originally planned. This general pattern also appears to be holding for currently active programs. (*See detailed analysis and discussion starting on p. 104.*)

Figure H-19. Actual Quantity Procured Compared to Original MS B Plans for Completed Programs (1997–2015 SARs)

NOTE: Completed programs are those that stop reporting after approximately 90 percent of units are delivered or 90 percent of funds are expended. There were n=63 completed programs in our dataset. The bars show the fraction of the 63 programs that procured the indicated range of original quantity percentages (e.g., 35 percent of the 63 programs procured 90–100 percent of their originally planned quantity). The blue line measures cumulative fraction of programs and is read off the y-axis on the right side of the plot (e.g., 19 percent of the programs procured less than 80 percent of their originally baselined quantity.

Tight budgets may motivate overly optimistic program baselines. Changes in DoD budgets at the start of a program (MS B) correlate in the opposite direction of the overall economic cycle (i.e., countercyclically) with changes in total contracted costs aligned to MS B for the contract's

456 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

parent MDAP. Thus, as budgets go down, total contracted costs (including both work-content growth and cost-over-target overruns) generally increase, and the opposite occurs when budgets go up. Analysis also found three stabilizing correction factors that adjust growth in total contracted costs when actuals vary from what was expected from the model. (*See detailed analysis and discussion starting on p. 92.*)

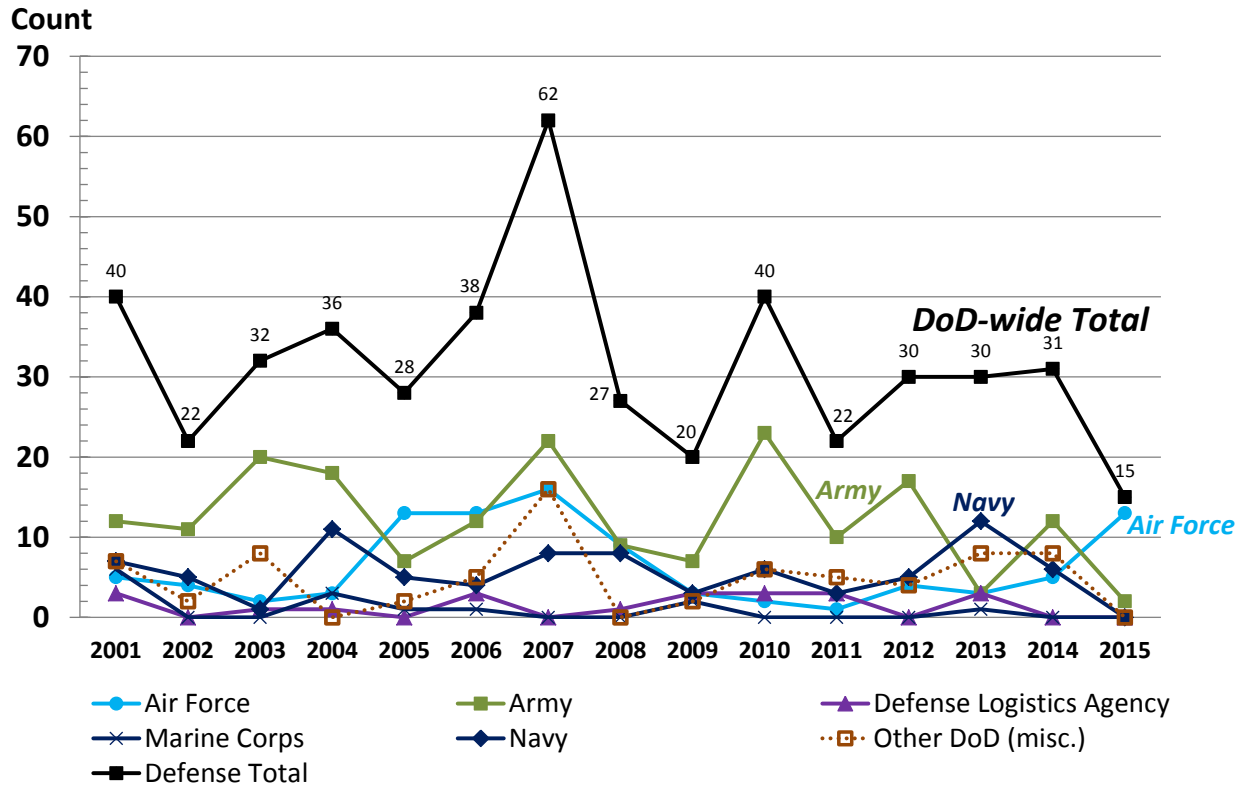
The countercyclical nature of total growth of MDAP contracted costs by MS B start date seems to imply that in tight budgetary environments resource planners were willing to take risks to maintain program start rates and used unrealistic and optimistic initial cost estimates to fit more content into military department budgets. With optimistic initial estimates on what typically are higher-risk development efforts, we would expect the higher cost growth that the data reflect.

Conversely, in accommodating budgetary environments, there may have been less pressure to assume risk to maintain number of program starts, so DoD Components may have had more realistic program start rates and cost estimates. With realistic initial estimates and low risks, we would expect lower cost growth.

These data (along with prior results from McNicol and Wu, 2014) further support caution about starting programs with overly optimistic program cost baselines and contract cost targets during periods when budgets are contracting or low, as in the current environment.

Schedule growth is lower than cost growth in development. Overall median schedule growth (B/C to IOC) since 1981 for active and completed programs is running at 1 percent while schedule growth on only active programs has ranged from 0 percent in 1997 to about 15 percent in 2015. In contrast, MDAP program- and contract-level cost growth in development tends to run in the 20–45 percent range, depending on what measures, data, and adjustments are included. Thus, there are indications that the DoD generally may prioritize schedule over cost, which makes sense given that our primary mission is equipping the warfighter against existing threats, but the data and results on schedule growth are mixed.

Operationally suitable programs are fairly likely to be operationally effective, too. An examination of the coincidence between DOT&E test results shows that major programs often tested as operationally effective when they tested as operationally suitable, but the converse was not true. In other words, we have a number of effective systems that have suitability issues (e.g., safety, interoperability, availability, maintainability, and reliability), but systems that address these suitability issues tended to also be effective against threats. (*See detailed analysis and discussion starting on p. 20.*)



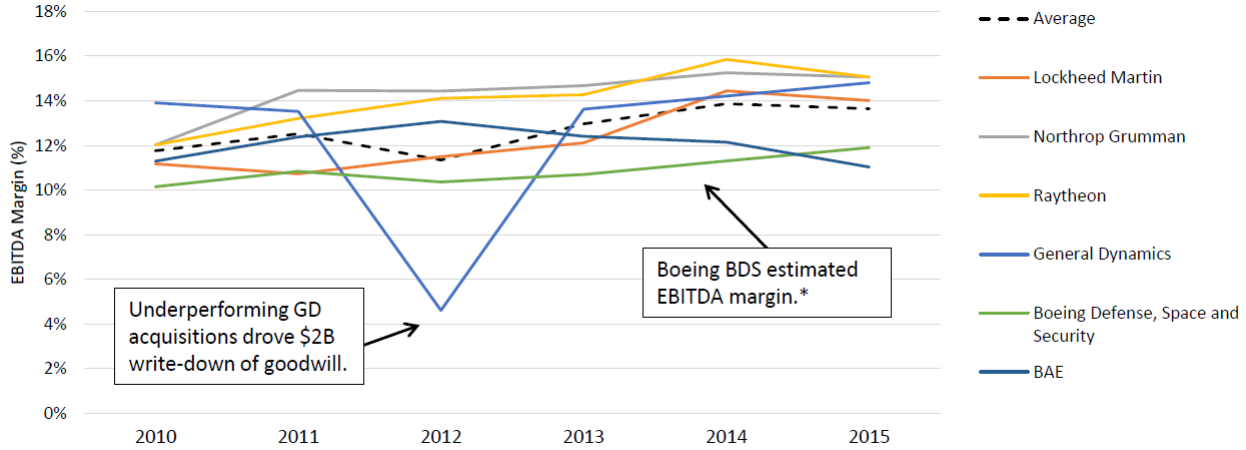
Labor, health-care, fuel, and maintenance costs appear to drive O&S cost estimates. DoD-wide, these factors correlate closely with O&S cost estimate changes reported in 2001–2014 SARs after adjusting for inflation. With some differences, these are also the dominant correlate types of factors for growth in O&S estimates by DoD Component and commodity. In nearly all cases, growth in system service life or quantity did not correlate with growth in O&S cost estimates. Thus, dynamics in these factors appear to be important for controlling O&S costs, and we found these dynamics can cause estimates to vary significantly from year to year (i.e.,

457 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

actual annual growths varied widely from about +/−15 percent since 2001). (*See detailed analysis and discussion starting on p. 95.*)

Bid-protest sustainments remain low despite increased filings. Despite corporate bid protests to GAO nearly doubling to about 1,300 per year, competitive source selections have increased by half and protests average only about 2.5 percent of solicitations (and about 0.25 percent of contract awards). As for outcomes, the number of sustainments by GAO has remained statistically flat at about 30 per year (see Figure H-20)—about 2 percent of filings. Thus, the increased number of protests appears to reflect, in part, external industry strategies or competitive pressures from the declining DoD budgets rather than poor DoD source-selection performance. These results are commensurate with the Congressional Research Service's recent analysis of bid-protest rates (Schwartz and Manual, 2015). *(See further discussion starting on p. 125.)*

Figure H-20. Number of Protests Sustained by GAO (FY 2001–2015)



Source: GAO

Prime defense contractors remain profitable. We monitor operating margins of our prime contractors to ensure that the net effect of our cost-control efforts—combined with other issues such as sequestration—are not negatively affecting the health of our industrial base. In addition to the operating margin data published in our 2014 annual report (USD(AT&L), 2014a, pp. 77–79), Figure H-21 plots the trends in earnings before interest, taxes, depreciation and amortization (EBITDA) since 2010 for the six largest DoD prime contractors. Generally, these

458 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

primes have performed consistently or slightly better against this measure since before BBP 1.0 was initiated in 2010. We will examine lower tiers on the industrial base in subsequent reports.

Figure H-21. Historical EBITDA Margin of the Six Largest DoD Primes (CY 2010–2015)

SOURCE: Company 10-K reports (Bloomberg).
NOTES: EBITDA are earnings before interest, taxes, depreciation and amortization. Years refer to corporate fiscal years (coinciding with calendar years).

ACKNOWLEDGMENTS

The analysis in this report could not have been performed without authoritative structured data archives in the DoD and GAO. The analysis was primarily conducted by Dan Davis, Ken Munson, Douglas J. Buettner, and Philip S. Anton, with much-appreciated assistance and contributions from Joseph Beauregard, Gary R. Bliss, Caroline Chien, Ellen Chou, Karen Cook, Margaret Cregan, Brian Davidson, Terence Emmert, Adrienne Evertson, Randall Fisher, Alan Fu, Susan Gates (RAND), Lynne Giordano, Larry Klapper, Matthias Maier, Andrew Monje, Philip D. Rodgers, Lisa Romney, Garry Shafovaloff, Thomas Sheehan, Nancy Spruill, René Thomas-Rizzo; E. Andrew Long and Catherine Warner (DOT&E); and Edward Goldstein, Jeanette S. McKinney, and Ralph O. White (GAO). Philip S. Anton, Dan Davis, Ken Munson, and Douglas J. Buettner were the primary writers, with very helpful reviews and comments provided by Philip D. Rodgers, Gary R. Bliss, Michael Glennon, Claire Grady, Susan Raps, and Kenyata Wesley. Benjamin Tyree and Michael Shoemaker cheerfully provided excellent editing on a very compressed schedule.

DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

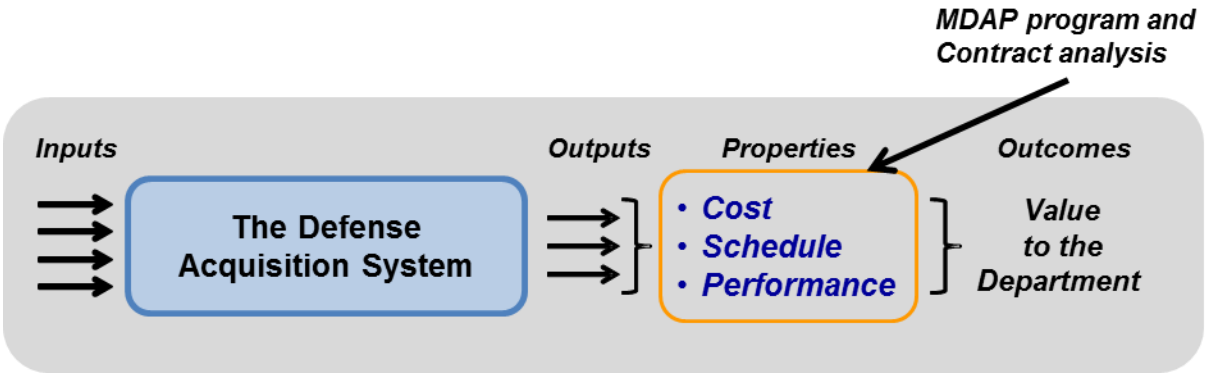
1. The Acquisition Landscape and Performance Measures

Our acquisition system—its institutions, offices, laboratories, workforce, managers, executives, and industrial partners—conducts research, provides a wide range of services, develops and produces new goods and weapon systems, and sustains these capabilities for warfighters and other operators. The performance of that system is measured relative to its outputs and outcomes of interest. Identifying internal policies, processes, workforce, and management capabilities that bear positively or negatively on those measures requires data and analysis to avoid speculative or cyclical policy choices based on current conventional wisdom and untested hypotheses.

The Defense Acquisition System

Institutional performance is all about acquiring value as efficiently (cheaply) as possible. Value to the DoD stems from the immediate benefits (i.e., technical performance) of the goods and services acquired in a responsive time (schedule) compared to the costs to the taxpayer. Hence, measures of cost, schedule, and performance serve as the basis for measuring the effectiveness and efficiency of the acquisition system in converting inputs to outputs (see Figure 1-1). The subsequent operational benefits of the acquired capabilities to address threats and fill capability gaps is more difficult to measure objectively with available data, and we will continue to explore ways to efficiently obtain such data on outcomes.

How Internal Functions and Processes Affect Performance



The acquisition system can be measured at two fundamental levels: (1) the major outputs and outcomes of the system, and (2) the key functions, responsible entities, and institutions responsible within the system to achieve those outputs and outcomes. The most readily available and measurable outcomes assessed throughout the report are cost and schedule performance, but some readily available information on technical performance is analyzed also.

Decomposing the acquisition system into major functional responsibilities enables analysis of how elements of the system affect ultimate outcomes. Intermediate outputs and outcomes of key institutional functions may correlate with cost, schedule, and performance outcomes, but others may be too small or difficult to discern from available data. Nevertheless, a functional decomposition facilitates an understanding of how well the defense acquisition system performs, based on management principles and intermediary outputs and outcomes. As this work moves forward, our greatest challenge remains identifying the relationships between and among factors the DoD can affect (policies, contract terms, incentives, workforce capacity and skills, etc.) and the outcomes sought. This report is a continuing step in that process.

462 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

Much of our analysis is statistical, focusing on institutional outcomes and their trends, rather than on single acquisitions and outliers (see Appendix A for a detailed discussion of the statistical methodologies). The objective is to see how well we are doing, learn from these generalities, and change our policies and tradecraft as we seek to improve outcomes. Many of the results continue leveraging readily available data on collections of programs and contracts and examining them from different groupings and perspectives. We continue looking for statistically significant differences on samples large enough to avoid an overgeneralization from case studies.

Figure 1-1. Output Measures for the Defense Acquisition System

PHASES OF ACQUISITION

This report assesses how our institutions perform—primarily by using existing oversight data aggregated to look for broader performance and trends. Because of their size and the risks involved, most readily available data are on MDAPs and their measurable outcomes rather than on smaller programs and the full breadth of contracted services. Still, these data provide partial insights on the acquisition of both goods (i.e., production of the weapon systems themselves) and services (i.e., development and testing of those weapon systems)—albeit primarily on major weapon systems. Also, we have begun to include data and analysis on contracted services where available (notably in the Superior Supplier Incentive Program results).

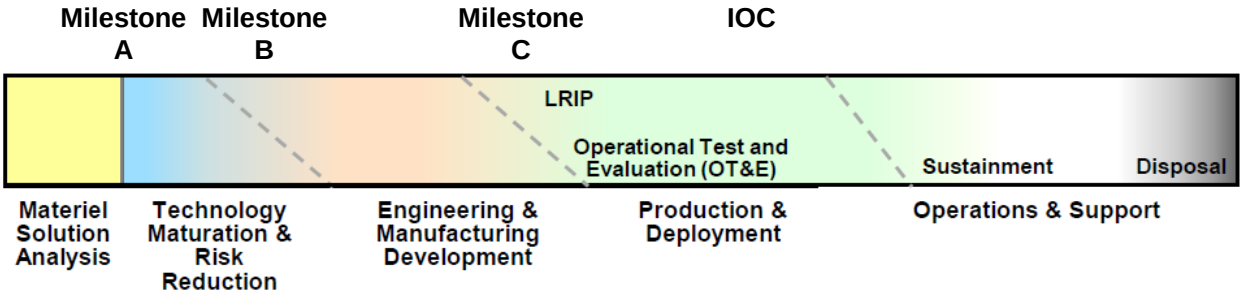


Figure 1-2 depicts a simplified program lifecycle and the portion where we currently have the best data for analysis—namely, for development and production up to full operational capability. Since structures and reviews are tailored to match program specifics in individual cases, this is a notional overview. For example, a program that uses mature technology may not need much technology or engineering development and might jump from the Material Solution Analysis directly to MS C, bypassing MS A and B.

While we have some data that reflect partially on the performance in other phases (e.g., early research, analysis of alternatives, early risk reduction, and sustainment), operation and support

463 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

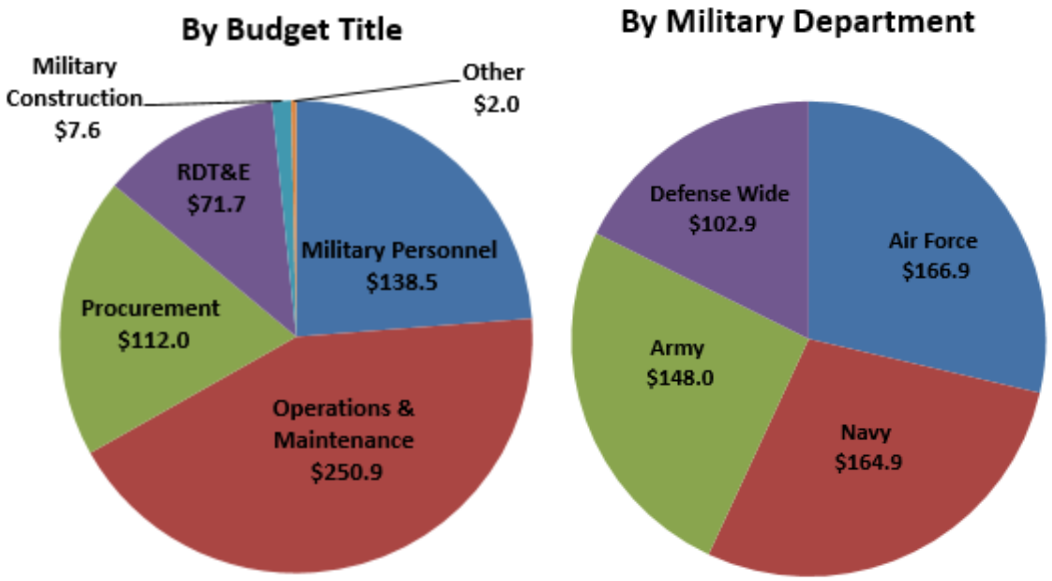
are reflected at best by early estimates and subsequent updates based on testing results and inflationary changes.

Figure 1-2. Typical Phases of Acquisition Programs

IOC = Initial Operational Capability
NOTE: This figure abstracts key elements from the example program models in the DoD Instruction 5000.02 (USD(AT&L), 2015a).

FOLLOW THE MONEY: ANALYSIS OF SPENDING

The defense acquisition system acquires goods and services to support our military forces—both now and in the future—while fulfilling our responsibility to prudently use taxpayer dollars. The DoD budgets and accounts for expenditures in various ways, each providing useful perspective on the purpose of the largest expenditures.



Spending by Comptroller Budget Accounts

Broken down by budget accounts reported by the Under Secretary of Defense (Comptroller) (USD(C)), the President's budget (PB) request for FY 2017 (including funds beyond the base DoD budget for Overseas Contingency Operations [OCO]) asks for (among other things) $112.1 billion for Procurement (including OCO) and $71.8 billion for RDT&E (see Figure 1-3 and USD(C), 2016a). Of this $183.9 billion, 40 percent ($72.7 billion) is for programs designated as MDAPs or MAIS, which provide the bulk of the readily available program data for analysis in this year's report (see USD(C), 2016b). In addition, the PB 2017 also requests $250.9 billion for Operations and Maintenance (O&M) and $ 138.8 billion for Military Personnel. A sizable portion of O&M also is spent on contracts for goods and services; thus, this portion is also part of the defense acquisition system. The OCO total for PB 2017 across these accounts is $58.8 billion (USD(C), 2016a).

Figure 1-4 shows how defense budget accounts have changed over time and compares these to PB 2017. As reported last year, DoD budgets oscillate in a pattern that repeats about every 24 years (plus inflationary changes and noise). The current budget is on the second half of the falling portion of the general pattern. Future budgets, of course, are hard to predict, but these patterns show some structure in recent budgetary ups and downs.

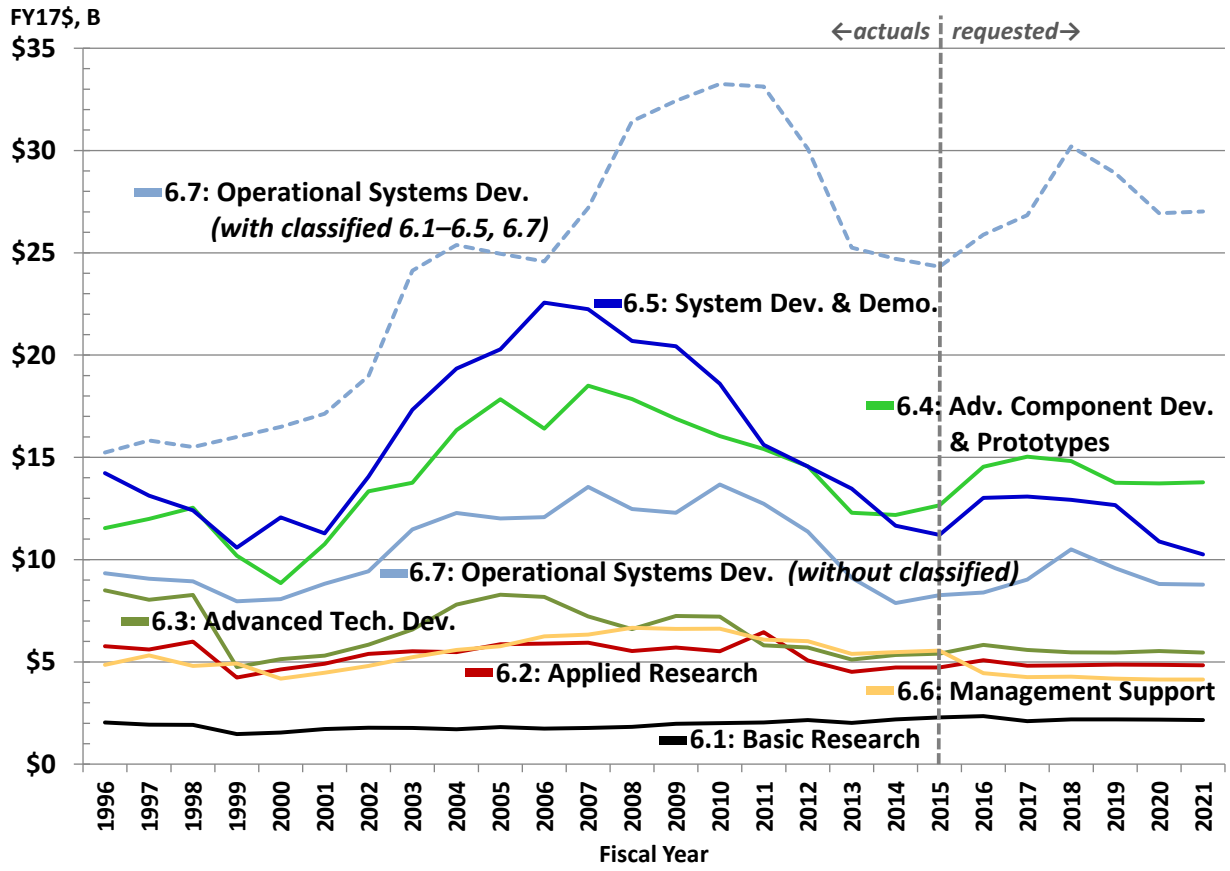
Figure 1-3. Defense Budget Breakouts PB 2017 (billions of 2017 dollars)

NOTE: OCO dollars are included.

Figure 1-4. DoD Funding by Budget Accounts: Historical and PB 2017 (FY 1962–FY 2021)



NOTE: OCO is shown in fiscal year actual budgets up through FY 2017. Budget amounts are adjusted for inflation and reported in billions of CY 2017 dollars (CY17$B).

465 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

RDT&E Budgets

Figure 1-5 shows the breakdown of DoD RDT&E funding and budgets by budget activity, going further back than in last year's report. This provides a detailed picture of how these accounts have fared historically—especially during the past budgetary surge and subsequent decline. Here the science and technology BAs (6.1–6.3) are relatively flat or returned to their pre-2001 levels. Accounts for Advanced Component Development and Prototypes (BA 6.4) and Operational Systems Development (BA 6.7, for existing systems) are projected to come down from their peak but remain higher than the levels in the 1990s. The System Development and Demonstration (BA 6.5) budget for new systems in the DoD's product "pipeline" is projected to decline to its lowest level in this time period. While BA 6.4 and 6.7 levels are not coming down as far, the low levels of BA 6.5 funding reinforce the DoD's concerns that we risk losing technological superiority in multiple operational domains.

Figure 1-5. Recent and Projected DoD RDT&E Funding as of PB 2017 (FY 1996–2021)

NOTE: Levels before FY 2016 are actual appropriations as reported in DoD Comptroller R1 exhibits; their totals closely match the RDT&E totals in the Comptroller's Green Book (USD(C), 2016c). OCO is shown in FY budgets up to FY 2017. Budget amounts are adjusted for inflation and reported in billions of FY 2017 dollars (FY17$B). The blue dashed line reflects the published total 6.7 budget, which includes total classified BA 6.1–6.5 and 6.7. The solid line is BA 6.7 minus published totals for classified programs included in BA 6.7 reports (i.e., without the distorting effects of the classified totals).

466 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

Note that further analysis of the content of these accounts reveals that USD(C) reports RDT&E totals for BAs 6.1–6.5 with BA 6.7, causing a distorting effect when comparing the relative magnitude of these RDT&E activities. Figure 1-5 shows BA 6.7 with and without the classified totals, which were not broken out in our prior reports. This provides a more accurate comparison of the relative magnitude of the RDT&E account trends since FY 1995.

Contractual Spending by Product Service Code Portfolios

Almost all of what we acquire comes through contracts with industry. Thus, a different way to understand what the DoD acquires is to examine contract obligations by type rather than budget account.

The contracting community uses a categorization called *product service codes* (PSCs) to track what is procured under Federal contracts.[12] The Federal Procurement Data System—Next Generation (FPDS-NG) records all awards and modifications for every contract worth (or anticipated may become worth) at least $3,000, so this taxonomy affords us a way to quickly look across all DoD external (contracted) spending.

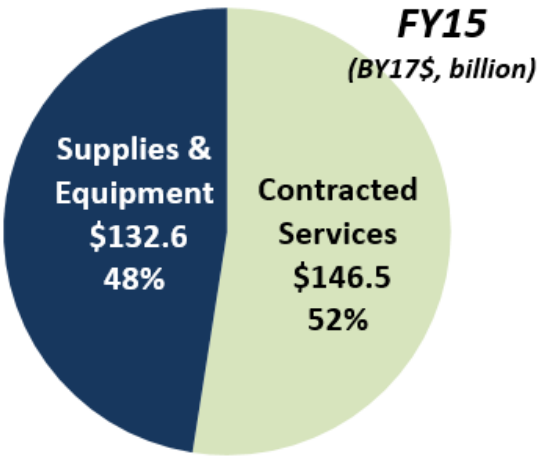
At the top level, spending (obligations in this case) is split between *products* (also referred to as *supplies and equipment*) and *contracted services*.[13] Figure 1-6 shows that in FY 2015, just over half (52 percent) of contract obligations were for contracted services. These data provided some perspective but may be misleading if you do not consider how the data are defined and what they included. For example, while the acquisition community generally considers RDT&E as part of developing a physical system, contract PSCs identify research and development (R&D) as a service (i.e., it is dominated by tasks that do not produce physical end items of supply). Maintenance on weapon systems is also often structured as a contracted service. Also contract obligations often include multiple types of work, but only one PSC is reported per obligation. In addition, the data include OCO, which is spending above the base defense budget and could be affecting the magnitudes and percentage split between contracted products and services.

[12]See the *Product and Service Codes Manual* published by the General Services Administration (2011). PSCs are recorded in the FPDS–NG to categorize what each Federal contract acquires.

[13] The Federal Acquisition Regulation defines a *service contract* as "a contract that directly engages the time and effort of a contractor whose primary purpose is to perform an identifiable task rather than to furnish an end item of supply" (see FAR, Section 37.101). Because the DoD often refers to the military departments (i.e., Army, Navy, and Air Force) as "Services," this report capitalizes "Services" when referring to military departments but uses lower-case "services" when referring to contracted services.

467 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

Figure 1-6. Total DoD Contract Obligations Split Between Goods and Services (FY 2015)



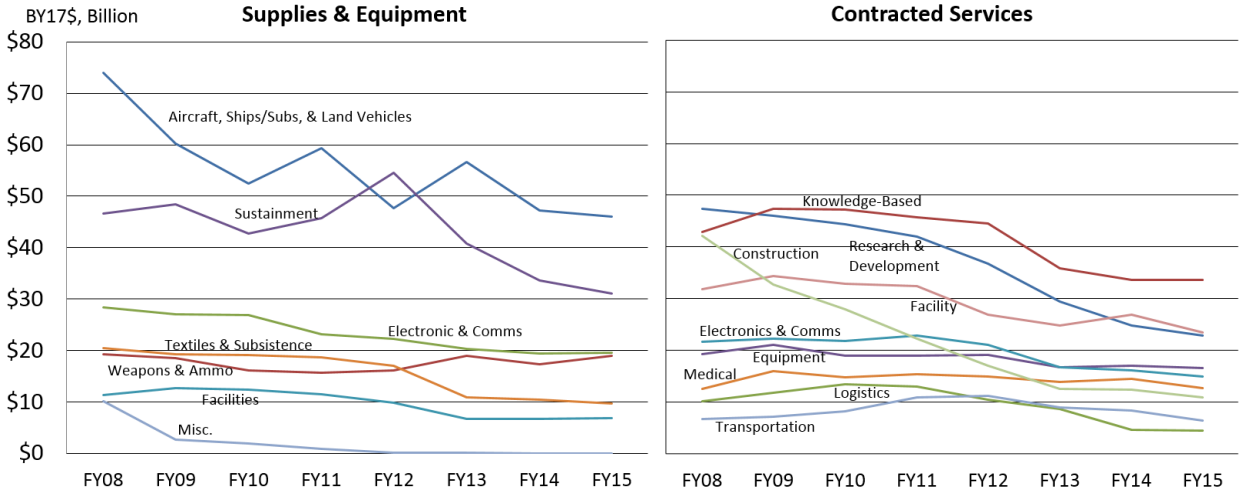


Figure 1-7 shows a further breakdown of all DoD contract obligations by groupings developed to aggregate PSCs into meaningful major portfolios. Here we see some contracting portfolios have remained relatively flat over the years while others are declining with the recent budget cutbacks.

Figure 1-7. Total DoD Contract Obligations by Portfolio Group (FY 2008–FY 2015)

NOTE: FPDS-NG data on all DoD obligations (including OCO). Obligations for contracted services in this period ranged from 57 percent in FY 2010 to 52 percent in FY 2015. All numbers are in billions of adjusted base-year (BY) 2017 dollars.

468 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

On Measuring Performance

Scope of Outcomes: Programs or Their Constituent Contracts

Our analyses often examine two main types of performance data:

- **Program-level data**—describing measurements across the entire program (e.g., growth in planned total funding from MS B baseline as reported in the SARs and MARs, including past actual funding, current funding requests, planned funding in the FYDP, and estimated needed funding beyond the FYDP to the end of the program). Data sources include the SARs, MARs, DOT&E's BLRIP reports, oversight data, the Contractor Performance Assessment Reporting System (CPARS), and review documentation.
- **Contract-level data**—describing measurements on one of the many contracts that constitute a program (e.g., the total cost growth from original negotiated contract target cost for an early lot of units procured). Data sources include Earned Value (EV) Central Repository, FPDS-NG, GAO bid-protest data, and cost data reports.

Program-level measures show how well the acquisition system developed the ability to produce the overall program against original baselines despite quantity changes, while providing insight into whether cost growth may have been a factor in quantity changes.

Contract-level measures provide early indicators of potential program-level issues by examining performance when the DoD contracts for specific work from industry. Nearly all the actual research, development, and production on weapon systems are performed by industry partners through contracts with the DoD. Thus, examining performance at the contract level provides detailed and potentially useful indicators of performance that eventually will be seen at the more aggregate program level.

This report often switches between these types of data as we examine different types of institutions (e.g., DoD-wide or military departments) and different phases of acquisition (e.g., development or early production).

While contracts are the key execution elements of a program (i.e., most goods and even services are provided by contractors), they have different baselines (e.g., contract cost targets) set at different times than the program's MS B baseline. Performance on individual contracts can be measured earlier than their effects might show up in program-level measures. However, because there often are numerous contracts within a program, and program baselines are not equivalent to contract cost targets, an individual contract performance may not necessarily reflect the performance revealed in program-level measurements. *Thus, it is important to recognize what type of data is discussed at each point in the report.*

Also, care must be taken to note whether cost data have been adjusted for inflation. Often the available program-level budget data we used have been adjusted for inflation (i.e., reported in "base-year" [BY] dollars), but some contract-level cost-growth data have not been adjusted (i.e., are reported only in "then-year" [TY] dollars, and insufficient temporal information was

469 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

available for us to adjust the reported figures for inflation). Thus, partly because of inflation, the program-level cost-growth figures in this report may be lower than those for some contract-level analyses.

Avoiding Maturity Bias in Testing for Recent Improvements

A primary reason for systematically measuring our performance is to determine objectively whether we are improving (i.e., whether our efforts are helped by recent policy and processes changes such as WSARA of 2009, three iterations of BBP[14], major efficiency drives, and continued investments in the acquisition workforce training and hiring). By their nature, recent programs and contracts have less cost and schedule growth because they are newer and have not had time to realize any growth. Unfortunately, waiting until they are complete will take many years—sometimes decades. This is but one challenge in comparing performance (other variables in the portfolio include shifting commodity mixes, budgetary changes, multiple parallel policy and process changes, etc.) and is a key analytic concern.

Rather than wait for the completion of programs and contracts before measuring their performance, we take the middle ground of controlling for immature programs in many of our analyses. The cost community generally has found that programs and contracts with large cost or schedule growth will begin seeing and reflecting it in their estimates by the time they have executed about 30 percent of their originally planned schedule. Thus, analyses in this report that control for maturity exclude newer programs and contracts that have not yet reached this point. This, of course, is not the final word, but it does allow us to reflect much of the anticipated performance problems and get a reasonable sense of recent performance.

Additional methods include examining incremental (marginal) growth rather than just total growth since inception. Our program-level analyses, for example, examine biennial change as a way of seeing if growth is added (or removed) on top of original estimates. If recent programs or contracts are worsening, we should be able to see that in the marginal change data.

Measuring Performance on Contracts

Price, schedule, and technical performance are key contract outcomes of interest. Ultimately, the *cost* to the contractor of providing a good or service relates in various ways to the *price* paid by the government. Thus, we often examine cost, price, or both (when possible). In most cases and where noted, contract price and cost data are adjusted for inflation. This allows us to distinguish real price and cost growth performance independent of inflationary effects. As for technical performance data, they are reported to the program office and are not generally available in the Office of the Secretary of Defense (OSD) for analysis.

[14] See USD(AT&L), 2010, 2013a, and 2015d.

470 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

Analysis of Work Content Growth and Cost-Over-Target

In other datasets, we do not have profit or fee data but can break down total cost growth into two broad elements of *work-content growth* and *cost-over-target*. Work-content growth is simply the change in the contract budget base (CBB), which reflects the contract target cost since contract initiation. Cost-over-target is the latest PM estimate at completion (EAC) minus the latest CBB, all divided by the original CBB. Unless otherwise indicated, all these contract cost data are reported in TY dollars and are thus *not* adjusted for inflation.

Note that contract targets themselves are not pure, unbiased estimates of project cost. In addition to expected project scale (size) they also reflect other contract terms, such as the share lines, incentive terms, as well as market contestability and the general negotiating environment. Thus, in part they are the result of bidding strategies.

471 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

2. Acquisition System Outcomes and Trends

A key to improving acquisition is learning from our successes and failures. Without looking at results of past actions, we have no feedback to inform whether our hypotheses and beliefs pan out in the complicated world of defense acquisition. Objectively examining the relative effectiveness of DoD acquisition Components and institutions while attempting to distinguish which factors and variables affect outcomes not only allows us to identify successes and failures, but also begins to lead us to specific lessons we can try to replicate—and control points we can exploit.

The following analyses examine key outcomes of cost, schedule, and technical performance of MDAPs across the DoD and by Components, commodities, and prime contractors—measured at program and contract levels. Combined, these analyses provide insight into potential cause-and-effect relationships, focusing attention on problems as early as possible, clarifying misunderstandings, and informing assessments and learning.

For our analyses of program data, note that the MDAPs examined are in varying states of maturity—from early programs that may or may not develop future problems, to mature programs adding new capabilities to existing systems, to completed programs.

We often use readily available EV data for our analyses of major MDAP contracts. This includes the six largest contracts per MDAP (prime, associated, or for government-furnished equipment) valued at over $40 million (TY dollars) but usually not firm-fixed-price contracts—see Title 10 of United States Code (U.S.C.) Section 2432. This also may include other EV-reporting contracts for MDAPs. These contracts may be for development or production. Unless noted, all datasets consist of all readily available cases rather than a statistical sampling from a larger set. In some analyses when we are trying to ascertain the general tendency of the population, we remove statistical outliers using standard tests; and these instances are noted. Otherwise, we include all data, including outliers. Also, we often report medians because this is a better measure of central tendency or “average” for skewed distributions than arithmetic means, which exaggerate the effect of outliers.[15]

[15]Part of the skewing in the distribution of cost change is the mathematical boundary of cost change because cost cannot decrease more than 100 percent, but it can increase more than 100 percent.

472 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

COST-RELATED FUNDING GROWTH AND DEFENSE ACQUISITION EXECUTIVES

Policy and execution decisions by DoD executives should bear (in part) on the effectiveness of the overall acquisition system during their tenures. This is particularly true for the program structure and associated baselines set at MS B, against which future cost performance is measured. Such decisions include changes to the defense acquisition system policies and procedures (e.g., through changes in departmental regulations); approvals, certifications, and exemptions within that system; institutional organization, policies, and processes; incentives; personnel selection, training, and mentoring; guidance and execution on larger programs, including acquisition strategies and choices; and myriad other effects. More specifically, the acquisition executives chair the boards that review programs at major milestones, guiding both program directions and specific approaches to contracting. Therefore, in our annual reports we track the performance of programs started under different acquisition executives to help reinforce accountability and provide an initial look for possible trends for further analysis.

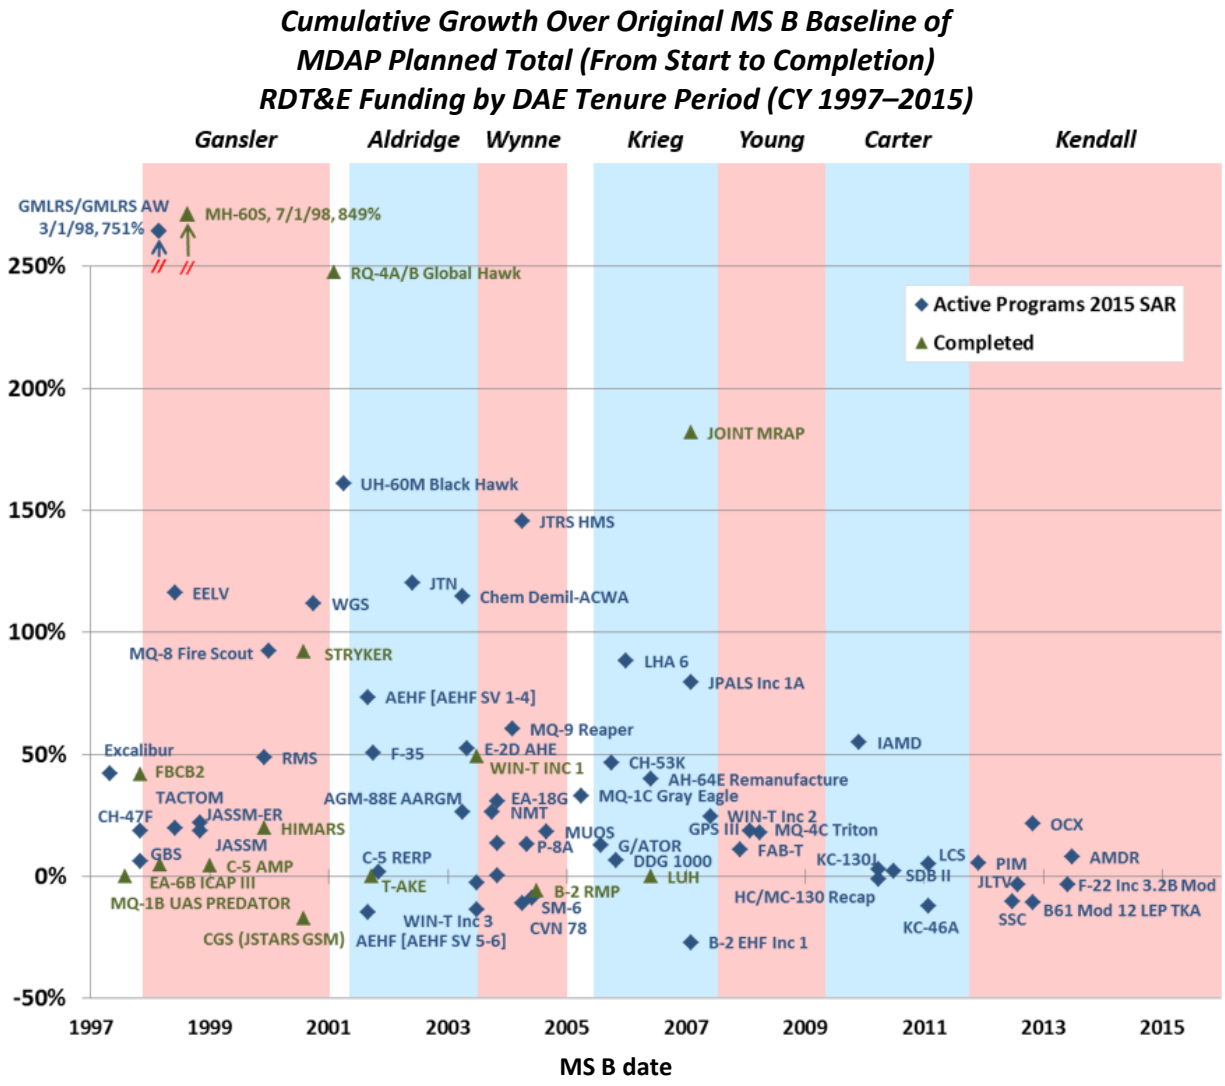

Figure 2-1 and Figure 2-2 show growth in planned total funding against original baselines for development and procurement as reported to Congress in the SARs on active and completed MDAPs. Note that SAR funding data reflect what the PM currently estimates will be needed in total by the end of the program for the current program configuration, including past actual funding, the current budget request, planned funding in the FYDP, and planned funding beyond the FYDP to the end of the program. Growth is measured against the baseline set at the original MS B and can be positive or negative.

These figures also show the DAE at the time of the MDAP's MS B approval; this infers influence through the DAE's policies and could include direct influence if the DAE was the MDA for the program. Later in the report we show similar charts for the programs started under different SAEs in the three military departments. We use total needed program funding instead of contract cost growth for these charts since needed funding is measured directly against the MS B baseline set by the DAE (see the discussion starting on p. 66).

Caution is warranted, however. These charts neither reflect the effectiveness of subsequent oversight or major program changes by later DAEs during execution oversight, nor do they report statistical analysis that controls for other internal and external variables that could have led to program success or problems. Also, as we mention above, each measure has its strengths and weaknesses, so attributing performance to a single measure is subject to the limitations of that measure. For example, some programs may appear to be performing well in terms of total needed RDT&E funding but may be having problems reflected in other measures (e.g., total needed procurement funding, estimated operational costs, and cost growth on one of the program's major contracts). Thus, a combined examination of available data is important before reaching conclusions.

473 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

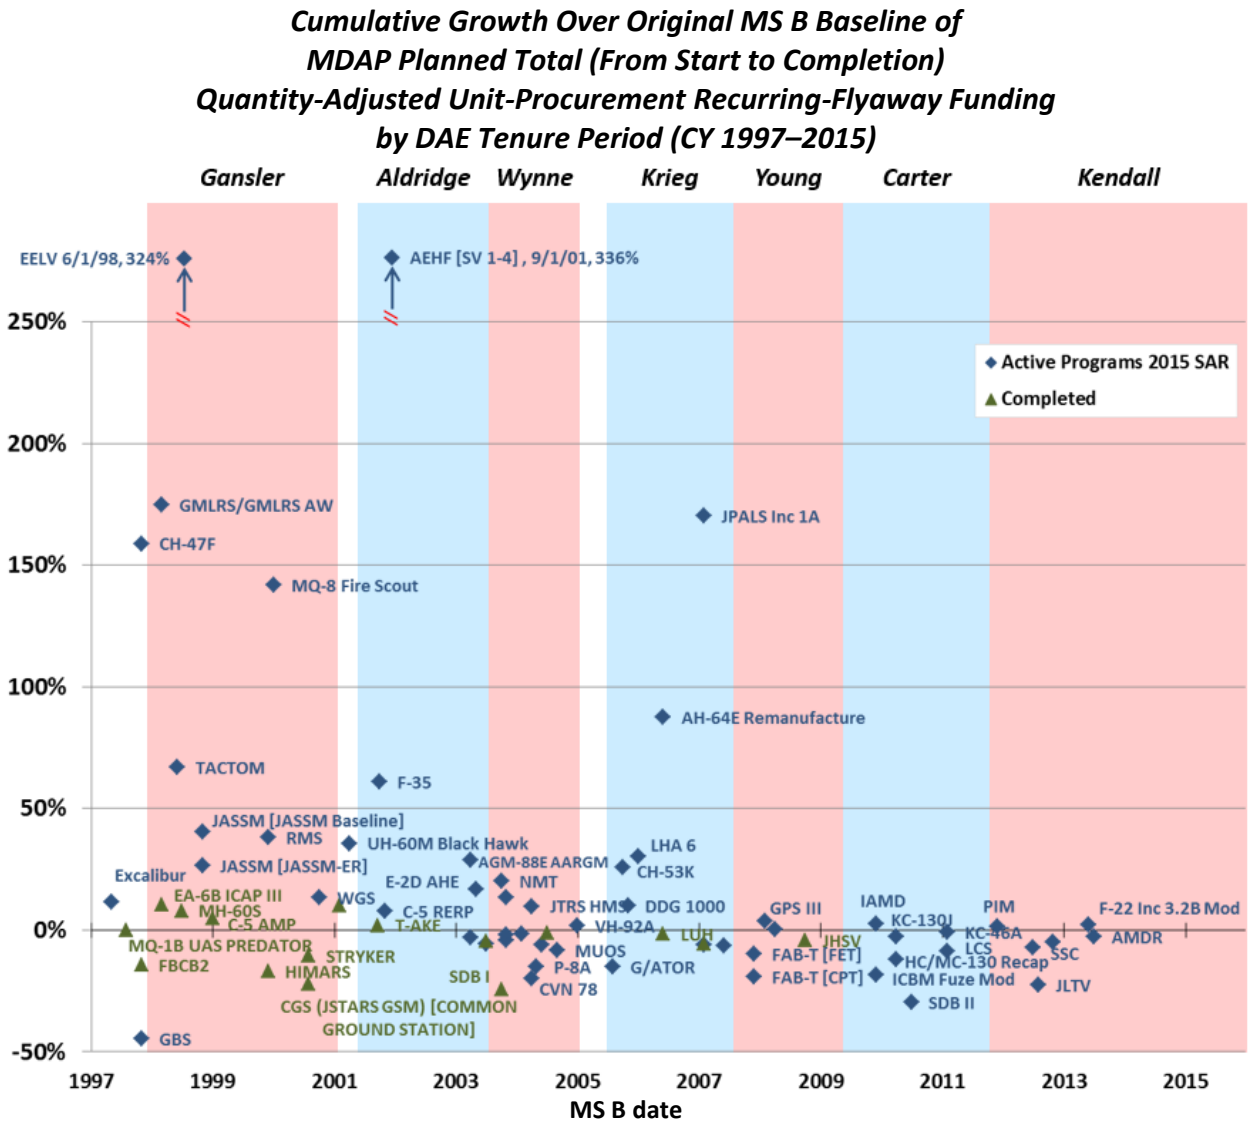

Figure 2-1. Program Cost-Related Development Performance Baselined in DAE Periods

NOTE: This shows total RDT&E funding growth independent of procurement funding and quantity changes; it reflects any work-content changes. These are percentage changes after adjusting for inflation from original MS B baseline of actual past and estimated future funding as reported in each program's latest SAR. Total RDT&E is an insightful measure because it is necessary regardless of quantity. White bars between DAE shaded regions represent periods with no confirmed executive. Not shown are relatively new programs that have not spent at least 30 percent of their original EMD schedule. Program abbreviations are defined in Appendix F starting on p. 159.

OPERATIONAL PERFORMANCE OF ACQUIRED SYSTEMS

While most of this report discusses outcome measures of cost and schedule, this section summarizes some readily available independent assessments of operational performance of weapon systems.

Operational Testing Results

Definitions

One measure of technical performance of acquired systems is how they rate, as a group, in operational effectiveness and suitability as assessed by DOT&E.[16] Operational *effectiveness* is defined in the *Joint Capabilities Integration and Development System (JCIDS) Manual* (CJCS, 2015) as: "Measure of the overall ability of a system to accomplish a mission when used by representative personnel in the environment planned or expected for operational employment of the system considering organization, doctrine, tactics, supportability, survivability, vulnerability, and threat." Operational *suitability* is a composite evaluation that considers a system's safety, interoperability, availability, maintainability, and reliability. Operational effectiveness and suitability are not measured solely on the basis of system requirements (e.g., Key Performance Parameters [KPPs] and Key System Attributes [KSAs]). Rather, measurements are accomplished through an evaluation that includes the system under test and all interrelated systems (including weapons, sensors, command and control, and platforms) needed to accomplish a combat mission in expected environments.

Reliability is a measure of the probability that the system will perform without failure over a specific interval, under specified conditions. *Materiel availability* is the measure of the percentage of the total inventory of a system operationally capable, based on materiel condition, of performing an assigned mission. *Operational availability* is the measure of the percentage of time that a system or group of systems within a unit are operationally capable of performing an assigned mission and can be expressed as *uptime*/(*uptime* + *downtime*). *Maintainability* is the ability of the system to be brought back to a state of normal function or utility. Maintainability is normally expressed as Mean-Down-Time, Mean-Time-to-Repair or a calculation of ease of maintainability. *Supportability* is the ability of the system to identify and/or predict failures down to a certain subsystem level within a given percentage of accuracy. *Survivability* is intended to ensure the system maintains its critical capabilities under applicable threat environments and may include reducing a system's likelihood of being engaged by hostile fire, through attributes such as speed, maneuverability, detectability, and

[16] DOT&E is independent statutorily from the acquisition organizations and is responsible for, among other things, reporting the operational test results for all MDAPs to the Secretary of Defense, USD(AT&L), Service Secretaries, and Congress. Operational test and evaluation is "the field test, under realistic combat conditions, of any item of (or key component of) weapons, equipment, or munitions for the purpose of determining the effectiveness and suitability of the weapons, equipment, or munitions for use in combat by typical military users; and the evaluation of the results of such test" (10 U.S.C., Section 139(a)(2)(A)).

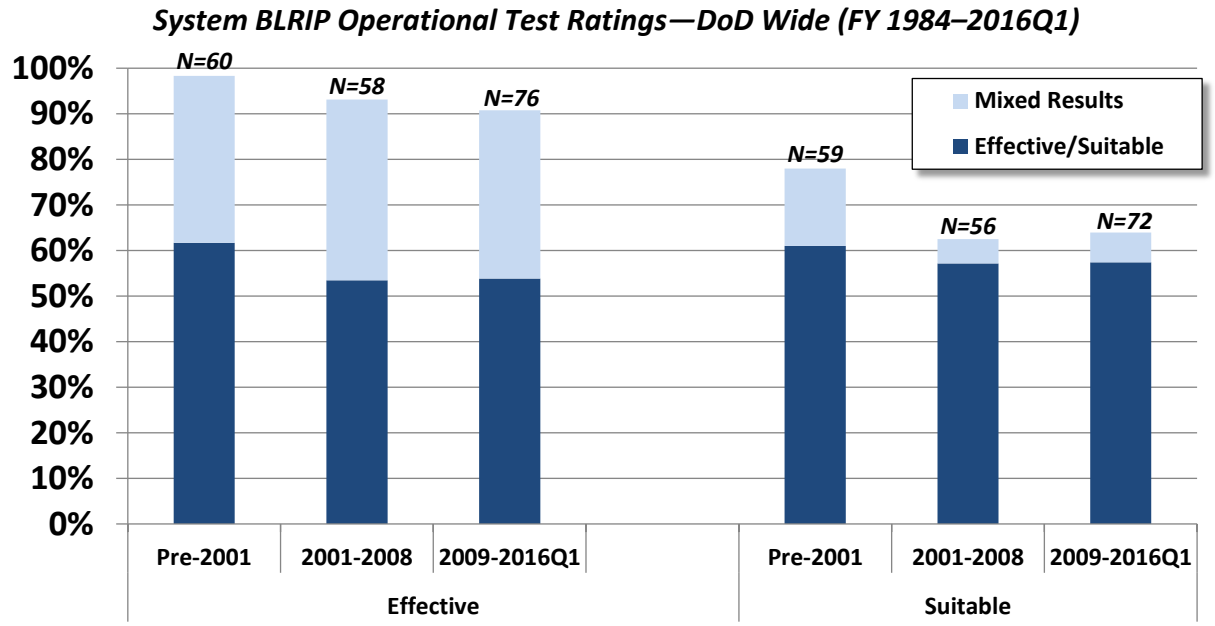
476 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

countermeasures; reducing the system's vulnerability if hit by hostile fire, through attributes such as armor and redundancy of critical components; enabling operation in degraded electromagnetic, space, or cyber environments; and allowing the system to survive and continue to operate in, or after exposure to, a Chemical, Biological, Radiological, or Nuclear (CBRN) environment, if required (CJCS, 2015).

We also discuss below the conditional probability of being effectiveness given test results for test adequacy, survivability, and lethality. The performance levels for these metrics are defined in each system's requirements documents.[17]

Developmental testing occurs throughout the earlier phases of a program's acquisition. It is intended to provide feedback to designers to verify performance and to discover and correct issues so that, by the time of operational testing on production representative test articles, major performance issues should be rarely discovered.

Note that in some cases results were not determined by DOT&E and thus were excluded from our data plots. In addition to new program evaluations, the number of programs in each sample also varies from last year because we now restrict our plots to DOT&E BLRIP summary data to improve consistency.



Trends in Operational Testing of Effectiveness and Suitability

The following figure shows no statistically significant trends (up or down) in DOT&E's assessments of operational performance of weapon systems across the DoD. Given the relative infrequency in which programs come up for operational testing, we grouped ratings into three sets of periods: FY 1984–2001, FY 2001–2008, and FY 2009 through the first quarter of FY 2016. Generally, it appears that performance dropped somewhat since FY 2001 compared to prior years (e.g., in the number of systems rated fully effective and the number of partially suitable systems). This perceived drop may be due in part to an overall trend of more complex, multi-mission systems. These changes nevertheless are not statistically significant. In other words, statistically the DoD's newly acquired systems perform in operational tests about as well as they always have through FY 1984 to present. In our ability to acquire quality systems, there is no degradation (or improvement) dramatic enough to be measurable statistically considering the relatively few programs in question.

[17] These are defined as follows. The *DoD Test and Evaluation Management Guide* defines *test adequacy* as having the amount of data and realism of test conditions sufficient to support the evaluation of the critical operational issues (COIs). 10 U.S.C. Section 2366(e)(3) defines realistic *survivability testing* as "…testing for vulnerability of the system in combat by firing munitions likely to be encountered in combat (or munitions with a capability similar to such munitions) at the system configured for combat, with the primary emphasis on testing vulnerability with respect to potential user casualties and taking into equal consideration the susceptibility to attack and combat performance of the system." 10 U.S.C. Section 2366(e)(4) defines realistic *lethality testing* in the case of a major munitions program or a missile program (or a covered product improvement program for such a program), as "…testing for lethality by firing the munition or missile concerned at appropriate targets configured for combat."

Figure 2-3. System Operational Test Performance

Source: DOT&E BLRIP reports.
NOTE: Differences are not statistically significant due to the low sample sizes (infrequent evaluations). Sample sizes differ between Effective and Suitable for some DoD Components because effectiveness and suitability could not be determined in all cases.

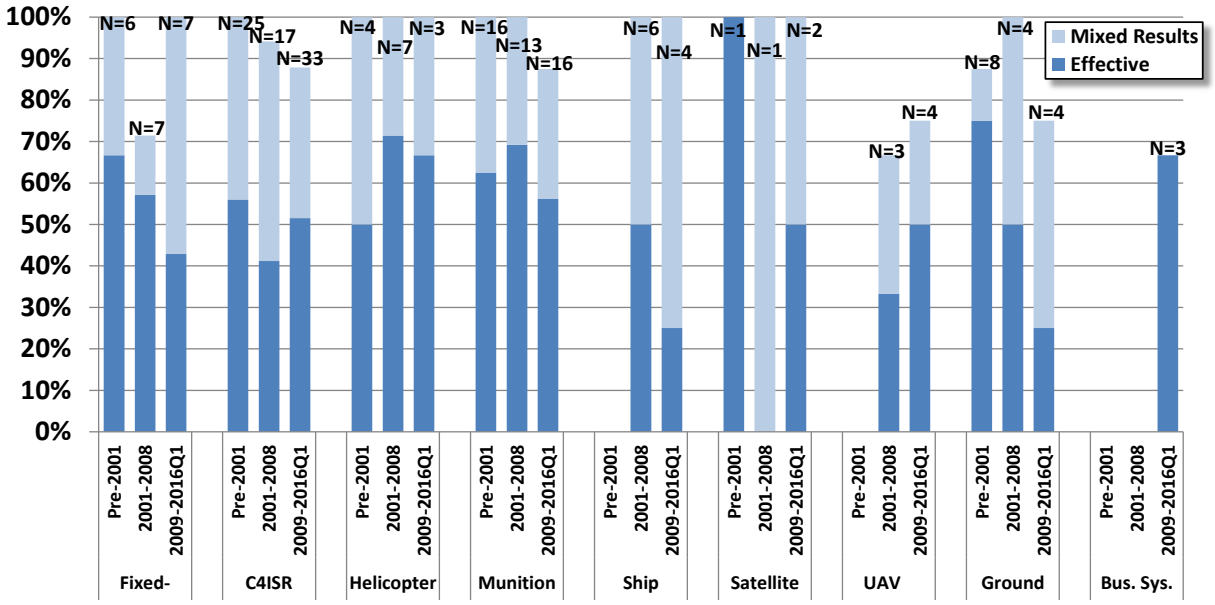
Causes. DOT&E also identifies why some programs are not rated as fully suitable due to a failure to meet the required reliability threshold (see Table 2-1). The categories and unclassified number of occurrences remain too small for a meaningful breakout by DoD Component, but the table gives some sense of the more dominant causes cited to date. The three high-frequency causes (i.e., inadequate design margins, system management, and software faults) are special-interest items for further analysis in next year's annual report and for systemic correction.

478 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

Table 2-1. Causes of Failure to Meet Required Reliability Threshold in Operational Testing (FY 1984–2016Q1)

Cause	System Count	Description
Part Quality (random failures)	2	Part failing to perform its intended function before its expected "end-of-life" limit is reached (random failures)
Inadequate Design Margins	23	Failures from engineering requirements, inadequate design (e.g., tolerance stack-up), unanticipated logic conditions (sneak paths), inadequate design margins for the environment, etc.
Manufacturing Anomalies	1	Failures not related to inherent part reliability but which result from anomalies in the manufacturing process
System Management	27	*Requirements management*: - incorrect or insufficient implementation or interpretation of requirements, processes or procedures; - imposition of "bad" requirements (e.g., missing, inadequate, ambiguous or conflicting); OR *Interface and environment management*: - failure to provide the resources required to design and build a robust system
Wear out	0	Wear-out-related failure mechanisms due to basic device physics
No defect	0	Reported failures that cannot be reproduced upon further testing. These may or may not be an actual failure; however, they are removals and, therefore, count toward the logistic failure rate
Induced Human Factors	3	Resulting from an externally applied stress. Examples are electrical overstress and maintenance-induced failures (i.e., dropping, bending pins, human factors, etc.). Can be design engineering requirements and design related.
Software Faults	16	Failures of a system to perform its intended function due to a software fault caused by inadequate engineering requirements or design.

Source: DOT&E BLRIP reports.
NOTE: These are unclassified results so far but do not include determinations for all programs since 1984. Not all types of causes in each category are exhibited by the programs.



Operational Testing of Effectiveness and Suitability by Commodity

The following figures show DOT&E's assessments of operational test performance of weapon systems by commodity types. Figure 2-4 and Figure 2-5 show effectiveness and suitability ratings, respectively, for BLRIP operational tests by commodity type. This year we split out Business Systems from the Command, Control, Communications, Computers, Intelligence, Surveillance, and Reconnaissance (C4ISR) category (where it was reported in our prior annual reports). While there are some differences, they are not statistically significant given the small sample sizes.

Correlations Between Summary Test Ratings

This year we included the following statistics on the correlation between suitability and effectiveness as well as the relationship between these high-level measures and their lower-level measures (e.g. suitability and its lower-level elements of reliability, availability, and maintainability).

Table 2-2 shows whether programs that tested effective also tended to be suitable (and vice versa). Here we see that a program was fairly likely to test as *effective* if it tested as *suitable*, but the converse was not true (i.e., we had a number of effective systems that had problems with safety, interoperability, availability, maintainability, and reliability. However, systems that address these suitability issues also tended to be effective against threats). Ninety-four percent of suitable programs (and 100 percent of partially suitable programs) tested at least partially effective. Only about one-seventh of not-suitable programs were not rated as effective. Conversely, only about two-thirds of effective or partially effective programs were rated as at least partially suitable, and about four-sevenths of not-effective programs were rated as having "not suitable" results.

Table 2-2. Correlation Between System Effectiveness and Suitability During Initial Operational Tests (FY 1997–2016Q1)

Counts:

	Suitable	Partially Suitable	Not Suitable	Not determined
Effective	64	7	30	5
Partially effective	39	11	21	3
Not effective	6	—	8	—
Not determined	1	—	—	1

Observed Conditional Probabilities:

Probability that:	***Given that the system is found to be:***			
	Suitable	**Partially Suitable**	**Not Suitable**	**Not determined**
Effective	58%	39%	51%	56%
Partially effective	35%	61%	36%	33%
Not effective	5%	—	14%	—
Not determined	1%	—	—	11%
	Effective	**Partially Effective**	**Not Effective**	**Not determined**
Suitable	60%	53%	43%	50%
Partially suitable	7%	15%	—	—
Not suitable	28%	28%	57%	—
Not determined	5%	4%	—	50%

NOTE: When columns in a category do not sum to 100%, there are small round off differences in the values of the observed conditional probabilities.

481 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

Correlations Between Summary Test Ratings and Subordinate Abilities

Next, we examined how predominant certain subordinate abilities are for the summary test ratings of effectiveness and suitability.

Table 2-3 shows the observed conditional probability estimates that a system was found to be operationally effective against tested threats given the adequacy of the test plan itself in operational test and evaluation (OT&E) and live-fire test and evaluation (LFT&E) as well as the system's survivable and lethal ratings in LFT&E.[18] Similarly, Table 2-4 shows the observed conditional probabilities that a system was rated as suitable given its reliability, availability or maintainability test results. As shown in Table 2-3, it is less clear how effectiveness ratings are affected by a test's adequacy and the system's survivability ratings during testing, but lethality ratings have a strong influence on effectiveness (e.g., no systems were rated as effective if they did not have at least partially adequate lethality). However, the results in Table 2-4 clearly show a strong correlation between suitability and the lower-level test results for reliability, availability and maintainability.

Table 2-3. Observed Operational Test Effectiveness Conditional Probabilities (FY 1997–2016Q1)

Observed probability that:	*Given that the system is found to be:*			
	Test adequacy in OT&E	**Partially adequate test in OT&E**	**Test not adequate in OT&E**	**Not assessed in OT&E**
Effective	60%	26%	—	—
Partially effective	33%	65%	—	—
Not effective	7%	7%	—	—
Not determined	0%	3.2%	—	100%
	Survivable in LFT&E	**Partially survivable in LFT&E**	**Not survivable in LFT&E**	**Not assessed in LFT&E**
Effective	72%	10%	23%	55%
Partially effective	23%*	90%	46%	38%
Not effective	5%*	—	31%	6%
Not determined	—	—	—	2%
	Lethal in LFT&E	**Partially lethal in LFT&E**	**Not lethal in LFT&E**	**Not assessed in LFT&E**
Effective	83%	60%	—	51%
Partially effective	17%	40%	100%	40%
Not effective	—	—	—	8%
Not determined	—	—	—	1%

* There are 6 systems that failed cyber security testing that are included in these numbers. DOT&E is currently revising how it tracks cyber security testing.

NOTE: When columns in a category do not sum to 100%, there are small round off differences in the values of the conditional probabilities.

[18] Generally, inadequate test plans are not approved, and if during the test something was not executable, the system performance for the requirement is not reported.

482 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

Table 2-4. Observed Operational Test Suitability Conditional Probabilities (FY 1997–2016Q1)

Observed	*Given that the system is found to be:*			
Probability that:	**Reliable**	**Partially Reliable**	**Not Reliable**	**Not Assessed**
Suitable	91%	62%	9%	25%
Partially suitable	5%	38%	10%	8%
Not suitable	4%	—	78%	8%
Not determined	—	—	3%	58%
	Available	**Partially Available**	**Not Available**	**Not Assessed**
Suitable	81%	20%	17%	42%
Partially suitable	7%	60%	3%	12%
Not suitable	12%	20%	78%	32%
Not determined	—	—	3%	14%
	Maintainable	**Partially Maintainable**	**Not Maintainable**	**Not Assessed**
Suitable	74%	60%	22%	41%
Partially suitable	9%	20%	5%	12%
Not suitable	16%	20%	73%	27%
Not determined	1%	—	—	20%
	Reliable, Available, and Maintainable	**Reliable and Available**	**Reliable and Maintainable**	**Available and Maintainable**
Suitable	92%	92%	91%	84%

NOTE: When columns in a category do not sum to 100%, there are small round off differences in the values of the conditional probabilities. The "Not Assessed" ratings are those cases where there was no suitability judgement made due to a lack of sufficient data to measure the requirements value.

COST PERFORMANCE: OVERALL

Nunn-McCurdy Program Breaches

Each MDAP is required by law to submit a SAR to Congress 45 days after the annual PB submission and under various other circumstances (see 10 U.S.C., Section 2432). A SAR reflects what is included in the PB as well as a comprehensive summary of MDAP cost, schedule, and technical performance (requirements) measures. Historical SAR data serve as the primary sources for much of our program-level analysis due to their relative availability and comprehensiveness.

Common program cost measures[19] such as PAUC[20], which includes both RDT&E and procurement, and Average Procurement Unit Cost[21] (APUC), which includes only procurement, are codified in statute. The statute also requires that programs exceeding certain thresholds (measured by PAUC or APUC changes relative to their original and current program baselines)

[19] Here, "cost" is synonymous with the total amount of funding because it reflects the prices paid on contracts as well as program execution costs. Later, when we discuss contracts, we will distinguish contract prices from their underlying contractor costs and margins (profits and fees).

[20] 10 U.S.C., Section 2432(a)(1), defines PAUC as "the amount equal to (A) the total cost for development and procurement of, and system-specific military construction for, the acquisition program, divided by (B) the number of fully configured end items to be produced for the acquisition program."

[21] 10 U.S.C., Section 2432(a)(2), defines procurement unit cost as "the amount equal to (A) the total of all funds programmed to be available for obligation for procurement for the program, divided by (B) the number of fully configured end items to be procured."

483 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

must go through a rigorous reexamination and certification to Congress along a variety of specified criteria. This process commonly is referred to as the "Nunn-McCurdy" process, named for the original sponsors of the legislation dating back to 1982 (see Schwartz, 2010, for an extensive overview of the process).

Two types of breaches are called out in the Nunn-McCurdy process: *significant* and *critical*. A significant breach is the lower threshold and is intended to warn Congress that a program is experiencing significant unit-cost growth relative to its baseline. A critical breach signifies the cost growth is even higher, triggering the formal reexamination and certification process mentioned above. The criteria for a significant breach are 15 percent from the current baseline, or 30 percent cost growth in APUC or PAUC from the original baseline. A critical breach occurs when the program experiences 25 percent cost growth from the current baseline, or 50 percent cost growth from the original baseline.

As with last year's report, we continue to report Nunn-McCurdy statistics based on our official list of breaches from 1997 through June 2016 (see Table 2-5). Recall that the numbers of breaches per year are slightly different than in our 2013 and 2014 reports.[22] It is important to note that the NDAA for FY 2006 made changes to the Nunn-McCurdy statute by adding the requirement to report unit-cost growth from the original baseline in addition to the current baseline. This additional requirement caused a large spike in 2005 when 11 programs had to report preexisting significant breaches. Thus, for historical comparisons, we need to compare current performance against those since 2006 because 2005 is a boundary condition and the years before 2005 were operating under different statutory rules.

Figure 2-6 shows the critical Nunn-McCurdy yearly breach rates and counts. The statistically significant downward trends since 2009 of non-quantity-related critical breaches (shown) and for all critical breaches continued through the second quarter of CY 2016, inclusive. For the trend analysis, we used the breach rates instead of counts to control for changes in portfolio size between years. We also controlled for program maturity and the recency of past breaches. Immature MDAPs that had not yet executed 30 percent of their originally scheduled time between MS B and MS C were removed from the dataset since they would likely bias the breach numbers so they would be artificially low. Also, any MDAPs that had a critical breach within the past 3 years were removed from the denominator of this measure since they are immature relative to their new baselines, and we have yet to see a program breach a second time before this period. Thus, these adjustments provide a more conservative (harder) test and higher percentages by removing the bias from programs that are naturally less likely to breach by nature of their newness.

[22] Our prior reports used quarterly SARs, whose dates may not align with the exact breach reporting dates to Congress. We also used to report breaches by SAR years, which do not align completely with calendar years because SARs can include information from the beginning of the next calendar year. In addition, canceled programs may not have a final SAR, and programs stop reporting at 90 percent of cost expended or quantity delivered.

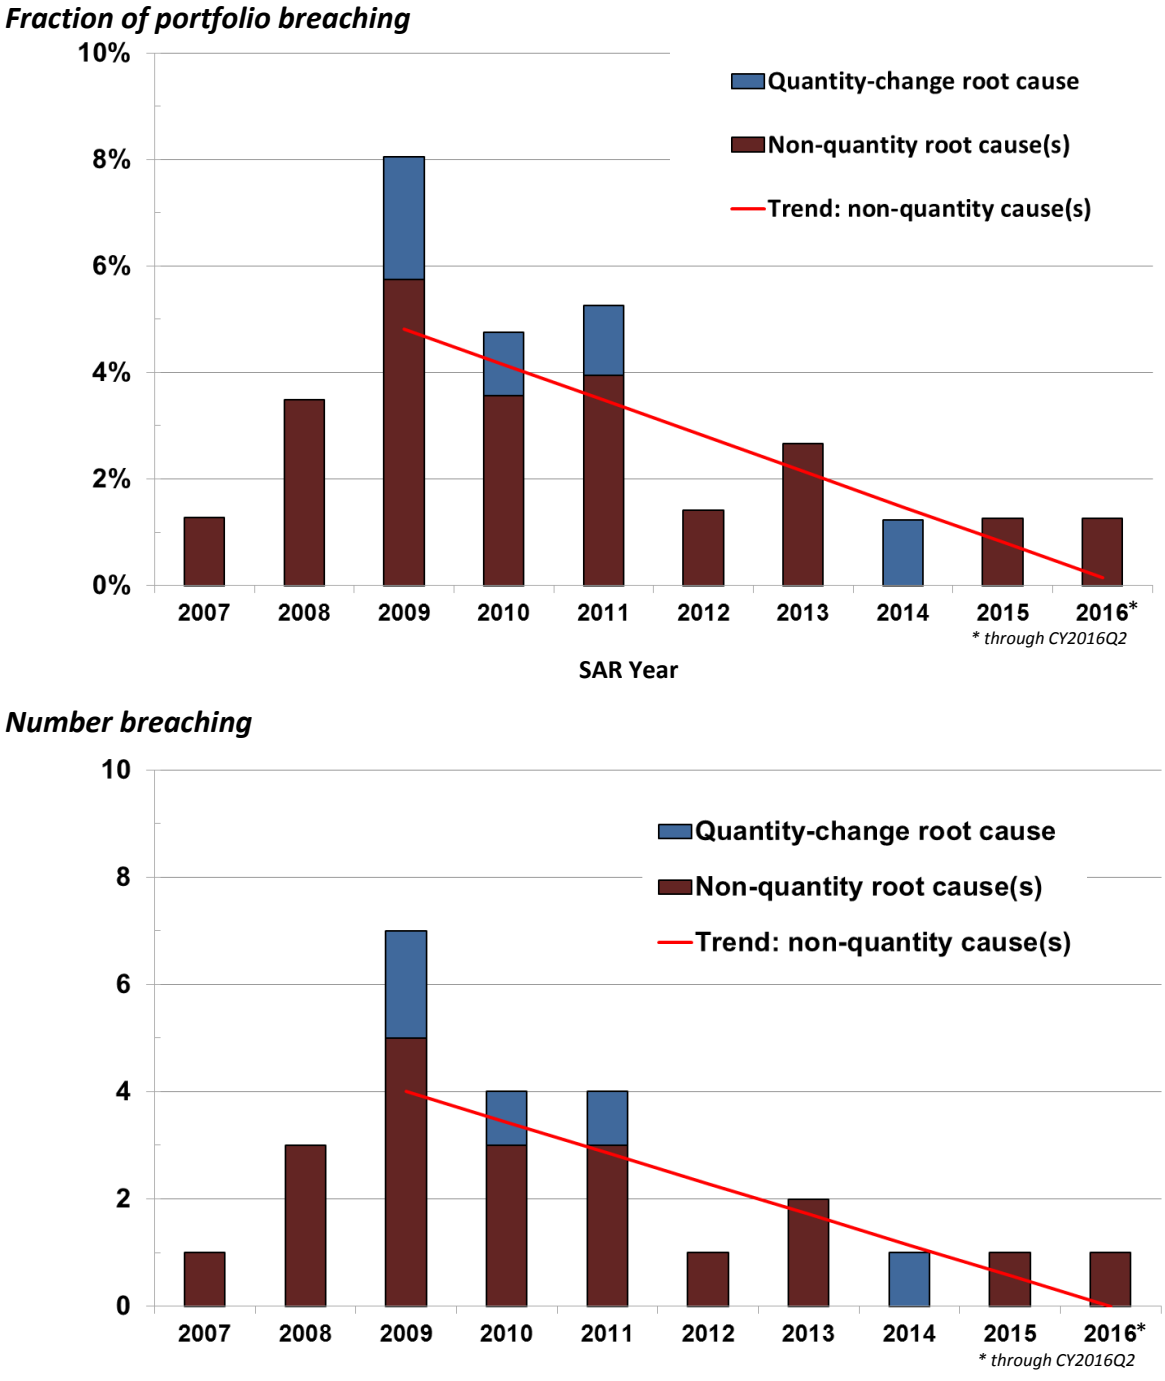
2009	• Apache Block III (AB3) • ATIRCM/CMWS • DDG 1000 • E-2D AHE • F-35 • RMS • WGS	• C-130 AMP
2010	• Chem Demil-ACWA • EFV[b] • Excalibur • RQ-4A/B UAS Global Hawk	• C-27J • Inc1 E-IBCT[b] • JLENS • NPOESS
2011	• AIM-9X Block I[b] • C-130 AMP[b] • JLENS[c] • JTRS	
2012	• EELV	
2013	• JPALS Inc 1A • VTUAV	• AWACS Block 40/45 Upgrade • JTRS HMS
2014	• JSOW[b]	• WIN-T (Inc 2)
2015	• RMS[b]	
2016Q2	• OCX	

Programs that declared a significant breach and subsequently a critical breach in the same SAR year are listed only as critical breaches. Programs that declared multiple significant breaches in the same SAR year are listed only once.

* Programs in purple shading (2006–2015 for critical; 2005–2015 for significant) breached against the original baseline as per the FY 2006 NDAA. Programs in blue shading (1997–2005 for critical; 1997–2004 for significant) breached according to prior criteria that allowed rebaselining. Eleven programs that did not have a breach prior to the new FY 2006 criteria had significant breaches as a result of this legislative change. The FY 2006 NDAA also permitted the following 25 programs to revise their original baselines to equal their current baseline estimates as of January 6, 2006, without declaring a critical breach: AEHF; AMRAAM; ASDS; Black Hawk Upgrade; Bradley Upgrade; C-17A; CH-47F; EELV; F-22A; FCS; FMTV; Global Hawk; GMLRS; Javelin; JSOW; H-1 Upgrades; Longbow Apache; LPD-17; MH-60R; Minuteman III Guidance Replacement Program; NPOESS; SBIRS High; T-45TS; Trident II Missile; V-22.

a Following a declared breach, the program was terminated rather than certified.

b Breach resulted from a decision to terminate the program.



c Breach resulted from a decision to terminate procurement phase; EMD units were completed.

d The DoD did not submit a December 2008 SAR to Congress due to a change in administration. The VH-71 breach was reported in the March 2009 SAR, but the breach occurred in the 2008 reporting period.

NOTE: Program abbreviations are defined in Appendix F starting on p. 159.

485 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

Figure 2-6. Critical Nunn-McCurdy MDAP Breaches (SAR Years 2007–2016Q2)

NOTE: Breaches due to quantity changes are based on PARCA root-cause analysis or review of information from the program's DoD Component. JSOW has been recategorized as quantity related (a change from last year's report). Since PARCA was not established until WSARA of 2009, it is unknown whether quantity changes were a root cause of breaches before 2009. There is a statistically significant downward trend in both total critical breaches and non-quantity-related critical breaches since 2009. Cost breaches are after adjusting for inflation. Since it usually takes a few years before a program might breach again, we removed programs from the portfolio count that have breached recently to avoid the potential bias towards an artificially low breach rate. Also not shown are relatively new programs that have not spent at least 30 percent of their original EMD schedule.

486 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

Causes of Recent Breaches

Here we discuss the causes of recent Nunn-McCurdy breaches. There was one critical breach each year from 2014 through the second quarter 2016 (with one due to quantity changes) and one significant breach in 2014 (see Table 2-6). Note that the 2016 count is tentative since the calendar year is not yet complete.

Table 2-6. Causes of Recent Nunn-McCurdy Breaches (CY 2014–2016Q2)

SAR Year	Causes
2014	**JSOW (*Critical*).** The Navy reported that the critical breach on the JSOW Unitary variant AGM-154C is the result of the termination of procurement at 3,185 units now that more effective weapons are available against current and evolving threats. Original 1992 Acquisition Program Baseline (APB) quantity was 7,800; the current 2009 APB quantity was 7,000 units.
	WIN-T, Increment 2 (*Significant*). The Army reported that this program breached due to cost increases from an 8-year extension of the procurement schedule due to Configuration Steering Board direction to transfer total Army requirements from Increment 3 to Increment 2 in conjunction with a reduction of less expensive nodes attributed to the revised Army modernization strategy. Additionally, there was an increase in costs caused by a 2-year extension of the procurement schedule due to reduced funding in FY 2021–FY 2028 identified by the Army's Long-Range Investment Requirements Analysis.
2015	**RMS (*Critical*).** RMS was canceled in March 2016 (after producing 10 out of 54 planned vehicles) due to unsatisfactory progress on system reliability and availability. Essentially, the government pursued build-to-print production of an immature laboratory prototype and lacked a clear understanding of the end-to-end operational mission thread for employing the vehicles. A combination of factors affected reliability, including obsolescence of underlying design and technology, age-related test vehicle failures, and system complexity. In addition to an earlier decrease in quantity (from dropping RMS from the Navy's anti-submarine warfare mission) and an unrealistic cost estimate for the 2006 APB, the root-cause analysis for the 2009 breach indicated that the program office's failure to deal effectively with the reliability issues was mainly due to an insistence on contracting for the hardware and engineering services based on built-to-print terms where the government accepted responsibility for the RMS design (see earlier details from the director of PARCA [DPARCA], 2010c).
2016 through Q2	**OCX (*Critical*).** This program breached on June 30, 2016, due to three root causes. First, the program was driven by intense schedule pressures from a perceived impending gap in the GPS constellation (which later lessened due to legacy systems lasting longer than anticipated); these pressures led to contract award prior to Milestone B and the program accepting systems engineering shortcuts. Second, both the Government and the prime contractor underestimated the cost to fully implement information-assurance requirements. The Government did not recognize information assurance as a driving factor and therefore did not include it in the risk reduction phase, and the contractor did not understand how the requirements applied to numerous commercial-off-the-shelf (COTS), free-and-open-source-software products, and reused code. Finally, there was poor performance both by the DoD and the prime contractor, Raytheon. The Government lacked software expertise and failed to act early on data indicating poor contractor execution. The contractor did not execute to plan (deferring requirements and inconsistently following their processes) and had poor configuration management.

487 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

Root Causes of Critical Breaches Since 2010

Developing systems beyond the current state-of-the-art often results in problems specific to each effort, resulting in the saying that programs succeed by employing well-established tradecraft but fail for rather unique reasons. Despite this, it is useful to abstract the failures into categories to identify commonality that might be rectified systemically. It is especially useful to conduct such reviews independently and to differentiate root causes from proximal causes. Table 2-7 summarizes such reviews on all statutory and discretionary root-cause analyses to since the PARCA office was set up in January 2010 (DPARCA, 2010a–g, 2011a–e, 2012a–c, 2013, 2014a–b, and 2016), including detailed breakouts of the management performance issues. Generally, the common root cause areas remain the same as those discussed in last year's annual report (USD(AT&L), 2015b).

Acquisition Improvements

Finally, despite the differing details of individual breaches, it is useful to discuss how recent program causes relate to ongoing efforts to incrementally improve acquisition by addressing specific issue areas (e.g., through BBP initiatives and principles).

The Joint Standoff Weapon (JSOW) critical breach in 2014 was from elimination of distant out-year production and resulting termination. The emergence of more cost-effective munitions obviated the need for the JSOW units predicted at the tail-end of the program buy. Thus, the cause is more one of an inability to predict the pace of future threat changes than a flaw in initiation or execution. The BBP effort to address technical superiority supports such decisions to evolve and react to threat changes.

The Warfighter Information Network-Tactical (WIN-T), Increment 2, significant breach in 2014 was due to production extensions from requirements changes and realization of long-term affordability limitations. While a breach factor, the imposition of the long-term affordability policy in BBP and associated corrections for WIN-T, Increment 2, is a positive sign that the DoD is working to take long-term affordability analysis seriously, which should result in early decisions and reduced sunk costs.

The RMS critical breach reported in the 2015 SAR was due to a termination for unsatisfactory progress on system reliability and availability. BBP is attempting to address the kind of prototype and mission thread issues experienced by RMS by improving how, when, and whether we use early prototyping and improving our understanding of threats and operational needs. Merely replicating immature prototypes can deliver new capabilities to the field quickly, but like rapidly acquired systems can often come with the results of limited engineering on the robustness of the system during operation (and possibly also limited utility for other missions).

489 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

The OCX critical breach was due to intense schedule pressures, underestimation of the costs to fully implement information-assurance requirements, and poor performance both by the DoD and the prime contractor. BBP directly addresses the third cause by seeking to improve the acquisition workforce capabilities (especially in software development expertise) and pursuing more effective contractor performance incentives. The second cause was aggravated by shortfalls in software and cybersecurity expertise in the program office, but the major contributing factor was that full implementation of cybersecurity requirements was new to both the buying command and the prime contractor.

In principle, our improvement initiatives such as BBP should continue to raise the cost consciousness of the DoD and sustain the downward trend in recent breach rates, but there is more to do. We have been working to improve the quality, training, and staffing levels in the acquisition workforce, especially of key leaders such as our PMs and PEOs. We have seen anecdotal progress in improved execution, but it will take continued investment, focus, and time for these effects to be realized in future Nunn-McCurdy breach data.

Breaches by Commodity

Table 2-8 below summarizes a different analysis of Nunn-McCurdy breaches by commodity. In this case, we do not “double count” programs that have breached multiple times. This allows us to compare the types of programs that have poor cost performance (as evidenced by crossing any Nunn-McCurdy threshold) to those that have never breached during this period.

As in prior years, helicopter programs showed an abnormally high breach rate, as do the four chemical demilitarization programs. The 100 percent breach rate for space-launch is not statistically meaningful given that only one program is in the dataset.

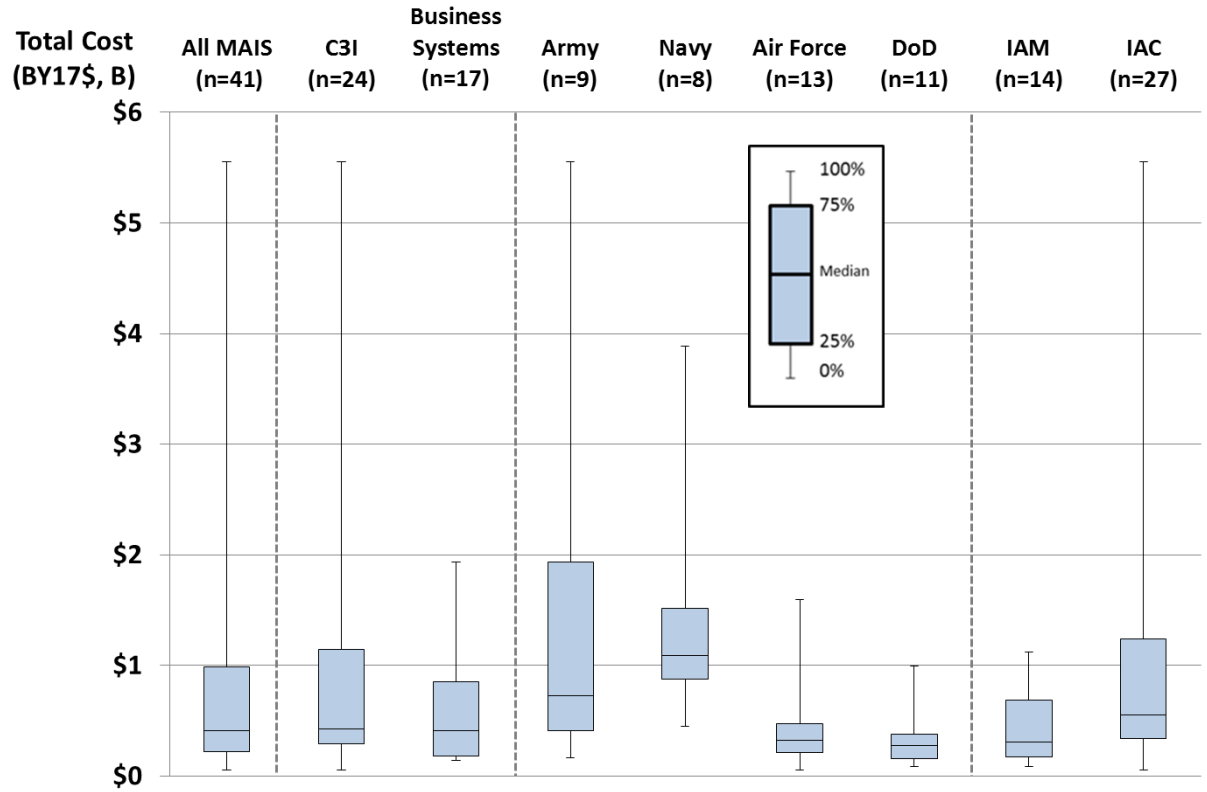
Missile Defense	8	1	13%	—	1
Total	**189**	**58**	**31%**	**18**	**40**

NOTE: Compares number of programs that have crossed any Nunn-McCurdy threshold to those that have never crossed a threshold. Breaches are determined using "base-year" dollars (i.e., adjusted for inflation). These commodity types are slightly different from those reported last year. For example, sensors logically belong in the C4ISR category, and unmanned aerial vehicles (UAVs) are broken out from aircraft to help reveal how they have fared.

MAIS and Business Systems

This section evaluates the performance of MAIS, including business systems. MAIS are ACAT IA programs that either meet a specified budgetary threshold[23] or are designated by the Secretary of Defense (or designee) as a MAIS (e.g., due to risk or other concerns) (see 10 U.S.C., Section 2445a). Title 10 mandates various reports and baselining mechanisms for MAIS. Figure 2-7 shows the current dollar size of the MAIS programs reported in at least one MAR in 2011–2015.[24] At least half of the MAIS programs have original total baselines below about $500 million (except in the Navy), while others can cost billions of dollars.



[23]For example, one MAIS threshold is $378 million in FY 2000 dollars for total lifecyclelife-cycle costs (see 10 U.S.C., Section 2445 for details and other thresholds).

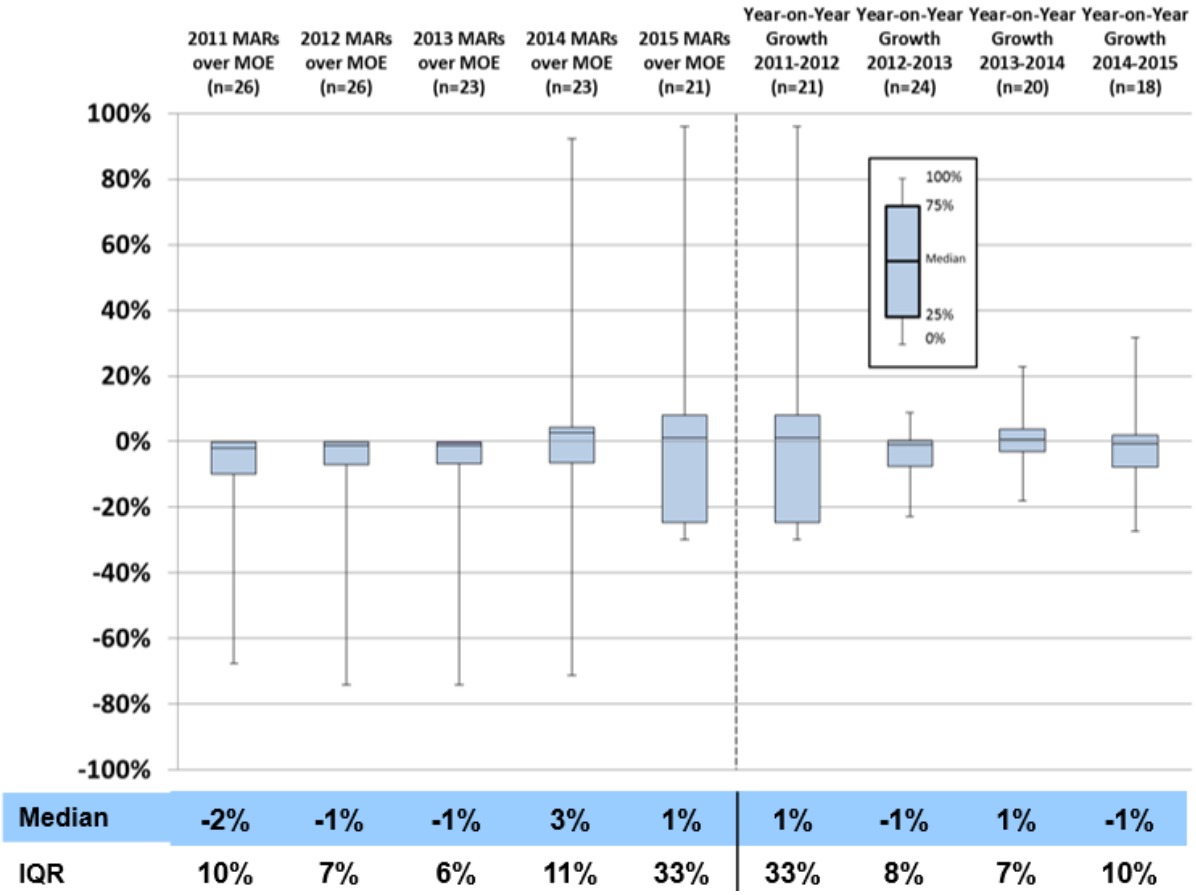
[24]MARs are the MAIS equivalent of SARs and are provided to Congress to satisfy the requirement in 10 U.S.C., Section 2445b.

491 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

Figure 2-7. Major Information System Sizes

Size Distributions (by Dollars) of Active MAIS Programs (MAR Years 2011–2015)

	All MAIS (n=41)	C3I (n=24)	Business Systems (n=17)	Army (n=9)	Navy (n=8)	Air Force (n=13)	DoD (n=11)	IAM (n=14)	IAC (n=27)
Median	$0.41	$0.42	$0.41	$0.72	$1.09	$0.32	$0.28	$0.31	$0.55
IQR	$0.77	$0.86	$0.67	$1.52	$0.64	$0.26	$0.21	$0.51	$0.91



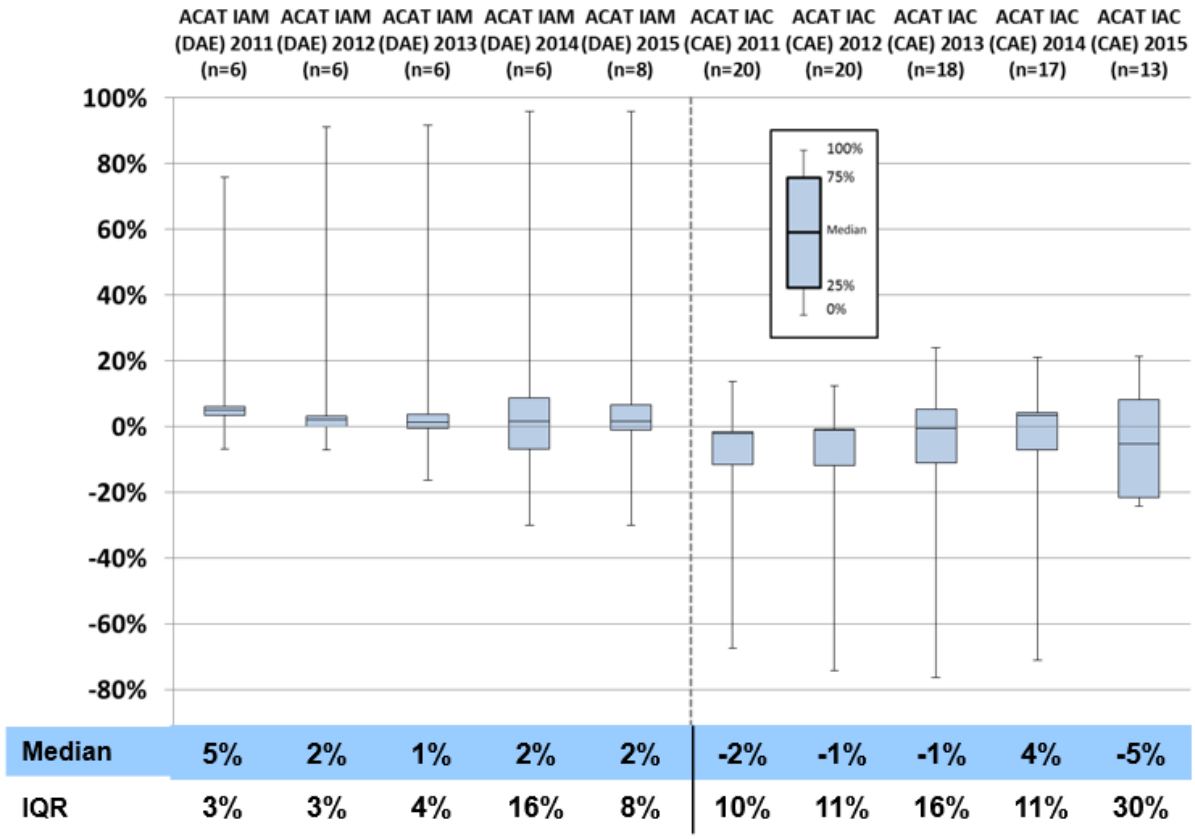
NOTE: Boxes show second quartile, median, and third quartile; bars show first and fourth quartiles, minimum, and maximum. The interquartile range (IQR) is the difference between the 75th and 25th percentile; IQR is analogous to variance by conveying a sense of the variability in the distribution. Immature programs that have not completed at least 30 percent of their original EMD schedule time were excluded to help control for maturity.

492 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

Figure 2-8 shows the funding growth from original baselines as reported in the 2011–015 MARs. We weighted results by program spend (dollars) and controlled for program maturity (a program is relatively mature when it passes 30 percent of the planned or actual time from FFO to FDD). Total funding growth from original baseline dropped to 1 percent at the median in 2015. Median year-on-year funding growth also dropped and ran negative between 2014 and 2015.

Figure 2-8. Program Cost-Related Performance: Information Systems

Cumulative Growth from Original Baseline and Annual Changes of Planned Total (From Start to Completion) Funding for Active MAIS (Weighted by Program Spend; MAR Years 2011–2015)



NOTE: The IQR is the difference between the 75th and 25th percentiles. Immature programs that have not completed at least 30 percent of their original EMD schedule time were excluded to help control for maturity. Original baselines are from the MAR original estimate.

493 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

Figure 2-9 compares MAIS funding growth from original baselines based on whether USD(USD(AT&L)) or designee is the Milestone Decision Authority (i.e., "IAM" programs) or oversight has been delegated to the DoD Component Head or the Component Acquisition Executive[25] (i.e., for "IAC" programs). Again, we control for program maturity and weight by program spend (dollars). The median growth for currently active IAM programs has remained flat at 2 percent while the variation tightened with an IQR of 8 percentage points. The median for the portfolio of active IAC programs dropped from 4 percent in 2014 to −5 percent in 2015, although the IQR increased to 30 percentage points.

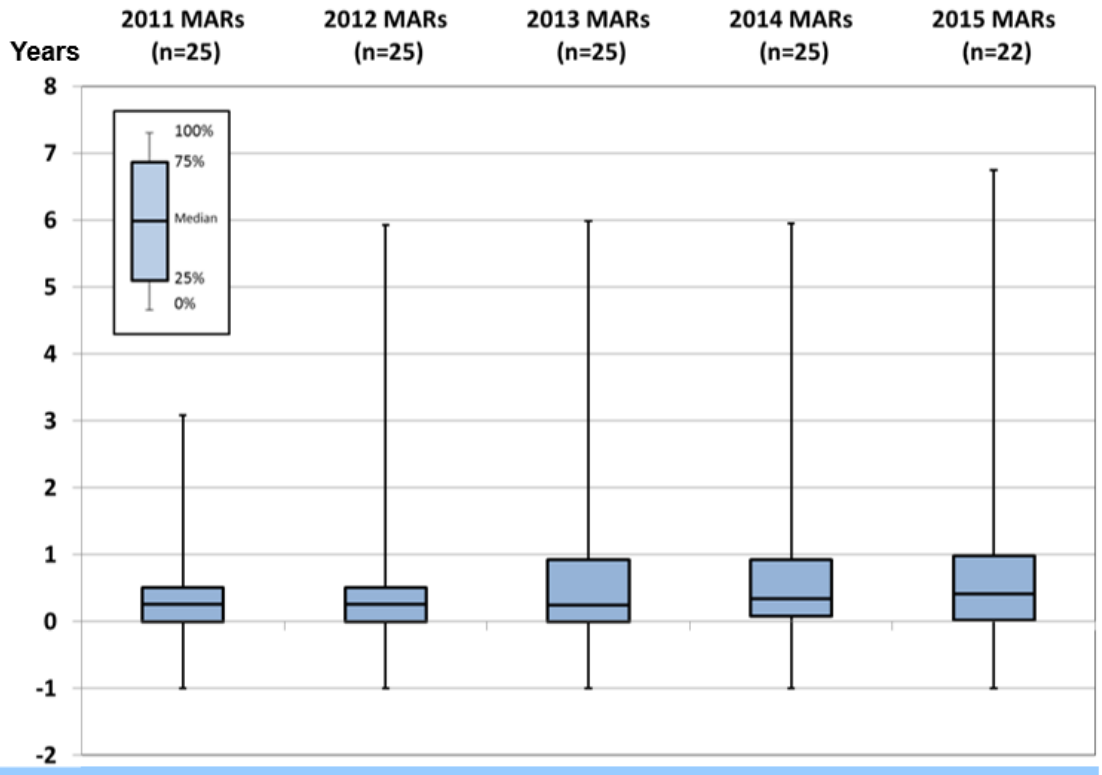
Figure 2-9. Program Cost-Related Performance: Information Systems by Decision Authority

Cumulative Growth From Original Estimate of Planned Total (From Start to Completion) Funding for Active IAM and IAC MAIS (Weighted by Program Spending; MAR Years 2011–2015)

Median	5%	2%	1%	2%	2%	-2%	-1%	-1%	4%	-5%
IQR	3%	3%	4%	16%	8%	10%	11%	16%	11%	30%

NOTE: Total funding includes O&M and Working Capital Fund. Boxes show second quartile, median, and third quartile; bars show first and fourth quartiles, minimum, and maximum. The IQR is the difference between the 75th and 25th percentiles. Immature programs that have not completed at least 30 percent of their original EMD schedule time were excluded to help control for maturity.

[25] In the military departments, the SAE is the Component Acquisition Executive.



494 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

These data showing low funding growth supports anecdotal assertions that, unlike MDAPs, MAIS may be changing their scope to match available funds and schedule thresholds. We currently do not have centralized data to measure requirement changes across MAIS to test this hypothesis. If true, however, examinations of performance relative to baselines would not be as meaningful as they are on MDAPs (where general capabilities are assumed to be relatively stable).

With respect to schedule growth, MAIS have shown a slight increase from about 3 months in 2011 to 5 months in 2015 at the median (see Figure 2-10). The variation across the portfolio has also increased with an IQR increasing from 6 months of schedule growth in 2011 to about a year in 2016.

Figure 2-10. Program Schedule Growth: Information Systems

Active MAIS Cumulative Planned Schedule Growth to FDD From Original Estimates (MAR Years 2011–2015)

	2011 MARs (n=25)	2012 MARs (n=25)	2013 MARs (n=25)	2014 MARs (n=25)	2015 MARs (n=22)
Median	0.25	0.25	0.25	0.33	0.42
IQR	0.50	0.50	0.92	0.84	0.96

NOTE: Original estimates are those reported in the first MAR for each MAIS. Schedule period is from MS B or FFO to FDD. Boxes show second quartile, median, and third quartile; bars show first and fourth quartiles, minimum, and maximum. The IQR is the difference between the 75th and 25th percentiles. Immature programs that have not completed at least 30 percent of their original EMD schedule time were excluded to help control for maturity.

495 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

COST PERFORMANCE: DEVELOPMENT

Planned Program Funding Growth: Development

We now examine MDAP development cost-related performance at the program level, using total RDT&E funding growth as the metric. Program "cost" (e.g., as defined for PAUC and APUC) is synonymous with the total amount of funding because it reflects the prices paid on contracts as well as program execution costs. Generally, RDT&E must be funded regardless of how many units are produced. In that sense, they are a fixed cost for the DoD to arrive at the point where we can procure and field a capability. Thus, for RDT&E, we track total funding growth rather than by units produced (e.g., as for PAUC and APUC) to avoid confusing the effects of even small quantity changes with growth in RDT&E. Since we measure growth compared to initial baselines, this measure can show significant increases when a program originally was planned to involve little RDT&E but received even modest additions to address changing threats or operational needs. Still, this approach provides a means for measuring total RDT&E funding control relative to original plans.

While examining total RDT&E funding from each program's original baseline estimate is important to capture the overall growth since inception, it may not be the best choice for gaining insight into *recent* cost-growth management. When we analyze a program from inception, we are forced to carry all growth until the program or phase of the program ceases to be active. Programs currently executing well but that had a one-time increase in the distant past can appear to be poor performers in the long term. Therefore, we also measure biennial changes in total planned and actual RDT&E funding.

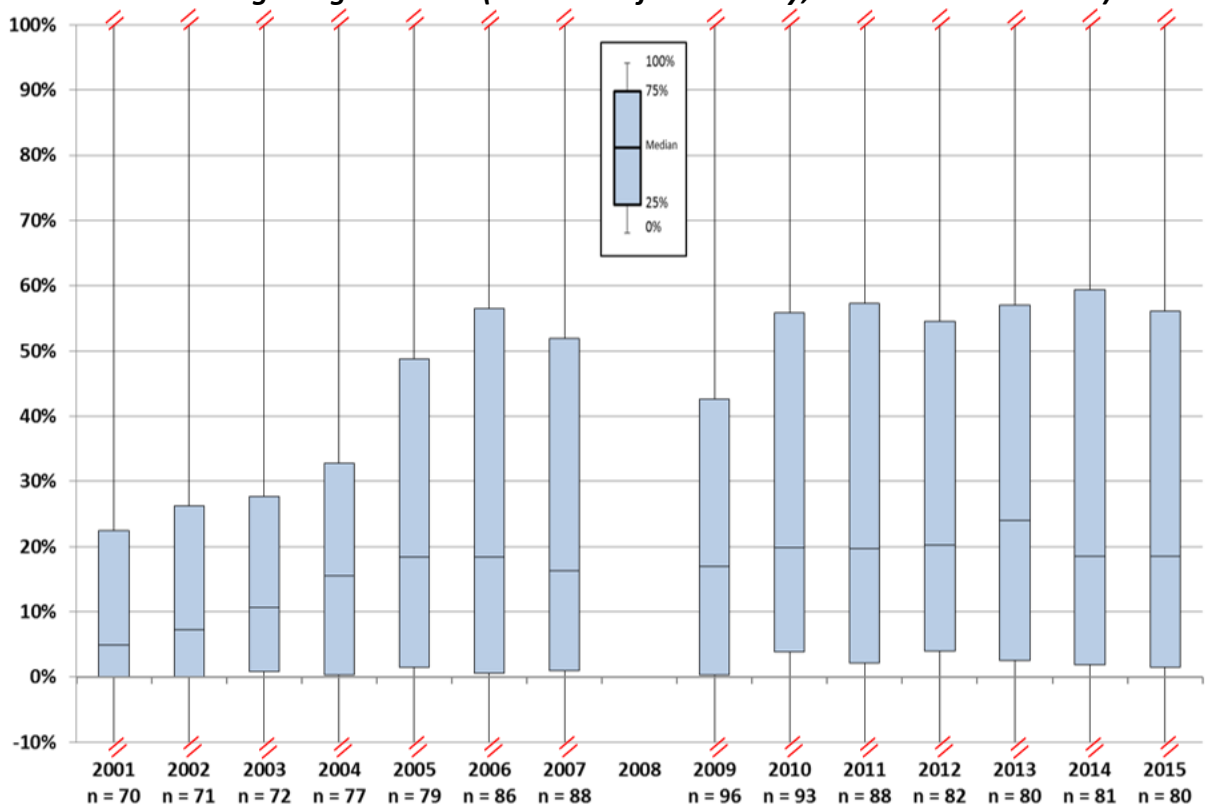


Figure 2-11 shows total cumulative RDT&E funding growth over original MS B baseline for each year's MDAP portfolio. This is the most conservative measure since it ignores any revised original baselines set after Nunn-McCurdy breaches. For each analysis, we first show the main portion of the distribution (between −10 percent and +100 percent growth) followed by a separate figure showing all outliers (especially those with growth greater than 100 percent). Medians are the lines within each box. Gray-shaded columns in the table beneath each chart were periods with very low sample counts because SARs for all active programs were not made in those years due to new Presidential administrations. The "x" markers above the box mark the five largest instances of program funding growth (although outliers above 100 percent only appear on the outlier charts). These outlier charts are controlled for program maturity only. Notably, the data show considerable (and sometimes seemingly conflicting) differences between the medians and the arithmetic means. This is because the data are highly skewed, and a single but very large outlier can have a large effect on the mean while not affecting the median.[26] In these cases, the best measure of central tendency is the mean.

[26] Part of the skewing in the distribution of cost change is the mathematical boundary of cost change because cost cannot decrease more than 100 percent but can increase more than 100 percent.

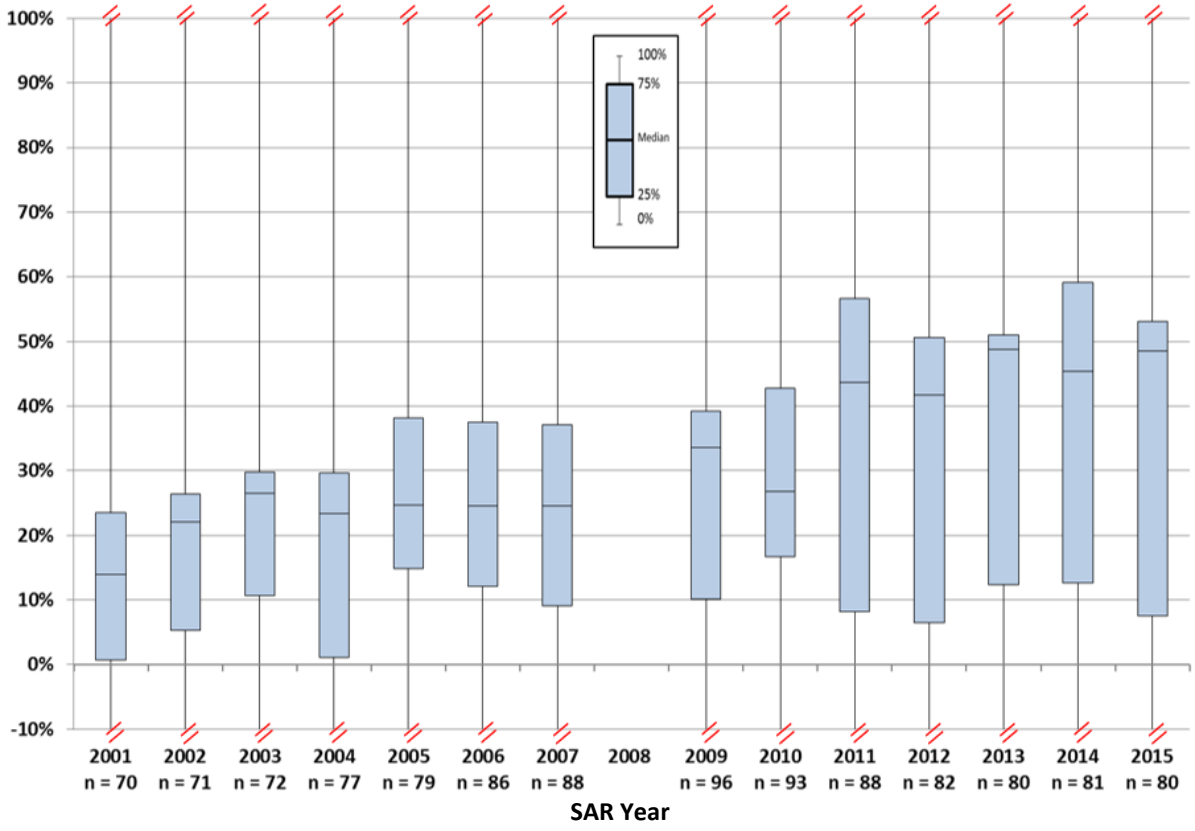
Trends	***Generally lower than 2009-2015***			***No trends across these years***											

NOTES: This shows total RDT&E funding growth independent of procurement funding and quantity changes; it reflects any work-content changes. These are percentage changes after adjusting for inflation from original MS B baseline of actual past and estimated future funding as reported in each program's latest SAR. Relatively new programs that have not spent at least 30 percent of their original EMD schedule are not shown. Boxes show second quartile, median, and third quartile; bars show first and fourth quartiles, minimum, and maximum. The IQR is the difference between the 75th and 25th percentiles.



As with last year's results, growth has been statistically flat since the earlier years of 2001–2004, when the set of MDAPs active at that time had lower total RDT&E at the median. In contrast to the results on a program basis, Figure 2-12 showing results on a dollar basis (i.e., weighted by program size in dollars) and controlling for maturity (i.e., removing programs that have not executed at least 30 percent of their original EMD schedule from MS B to MS C). Here growth has been statistically increasing since 2001. In other words, larger programs (in terms of spending) have systematically larger total RDT&E funding growth, and that growth has been

497 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

increasing. Thus, our outlier programs also are our largest by spending, and they are increasing. The F-35, for example, constitutes about 20 percent of the dollars in the current MDAP portfolio and thus has a large effect when weighted by program size (dollar basis). However, the F-35 median total funding growth is very close to the median of the rest of the portfolio. Thus, it is not driving the value upward but will tend to affect whether the median changes in the future. Also remember that here we are measuring growth against the original MS B baselines independent of any revised original baselines (due to program reconfigurations from Nunn-McCurdy breach).

Figure 2-12. Program Cost-Related Performance: Development (Weighted by Program Size in Dollars)

Boxes show second quartile, median, and third quartile; bars show first and fourth quartiles, minimum, and maximum. The IQR is the difference between the 75th and 25th percentiles.

498 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

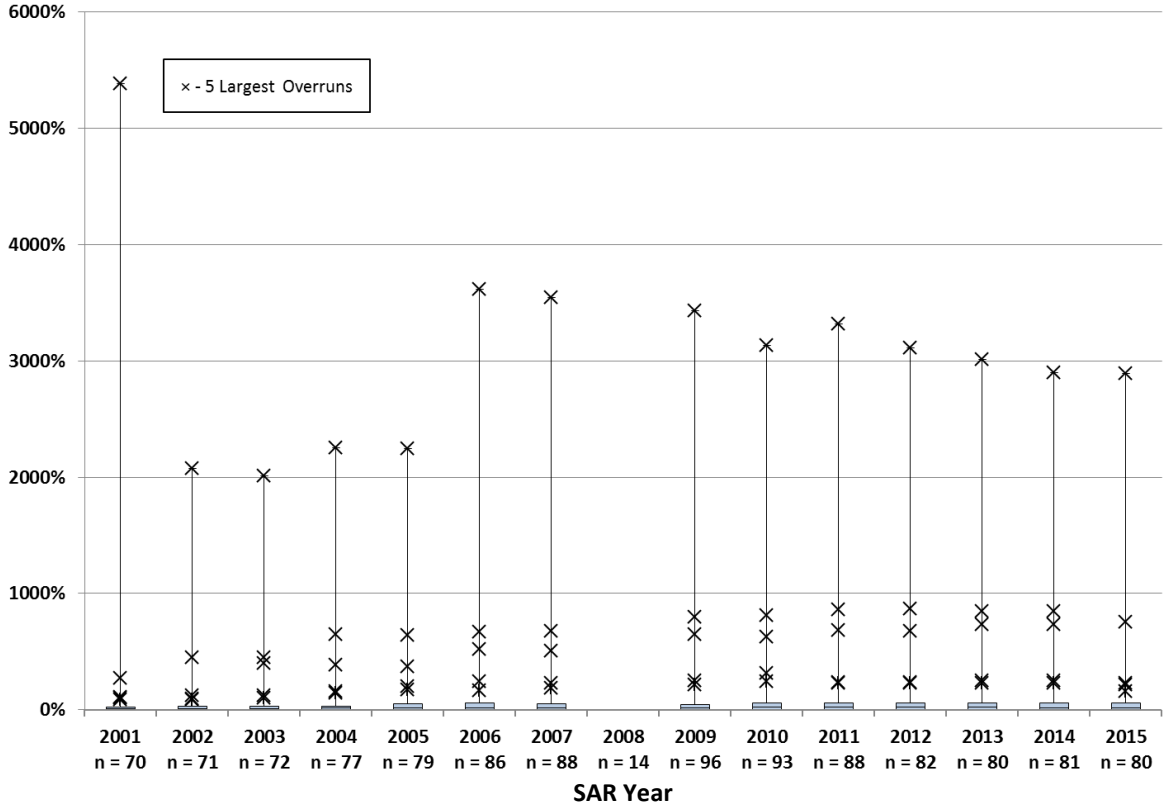

Figure 2-13 shows the outliers that are off the chart in Figure 2-11 and Figure 2-12. While C-130J remains the largest outlier, this year AIM-9X and UH-60M entered the top five because MH-60S and RQ-4A/B Global Hawk are no longer active. These outliers have very large growth percentages but are not representative of the overall MDAP portfolio. These extreme growths are not due to measurement error and so were not excluded from the analysis. Still, they do skew the aggregate data, which is an important fact for determining how to measure and discuss funding growth across a program population. Similar skewing is observed in various complex commercial projects (see, for example, Flyvbjerg et al., 2002). Much of the funding growth from original MS B baselines are from prior years since recent marginal funding growth in RDT&E has moderated significantly at the median.

Understanding *why* a program may exhibit such a large percentage increase in RDT&E funding requires an individual examination of each case. For example, in Figure 2-13, the C-130J remains the highest outlier since 2002. This program originally was envisioned as a nondevelopmental aircraft acquisition with a negligible RDT&E effort planned. Several years into the program, a decision was made to install the Global Air Traffic Management system, adding several hundred million dollars to development and causing the total development funding growth recently to climb upward of 3,000 percent. This is an example of a major change in the program rather than poor execution, although significant program changes like this are not necessarily the reason for all extreme cases of funding growth.

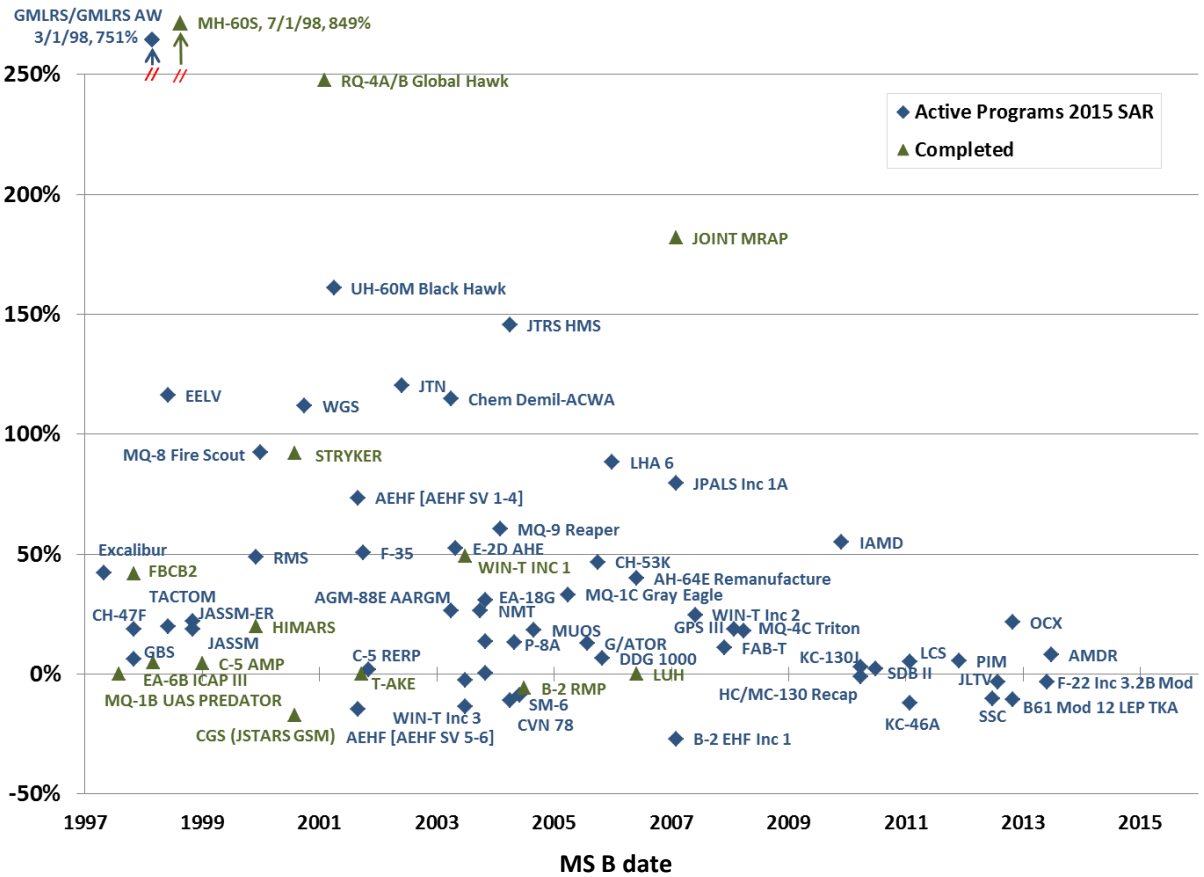
X's mark the growth for the five largest outliers on each box-and-whisker chart. Program abbreviations are defined in Appendix F starting on p. 159.

503 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING



Program Funding Growth by Start Date: Development

A different way to examine program performance is to ask whether recently started MDAPs are controlling RDT&E better or worse than completed and active older MDAPs. This is important since we found in our 2013 report that MDAP contracts that start off well continue to do better, and this is commonly believed to also hold at the program level.

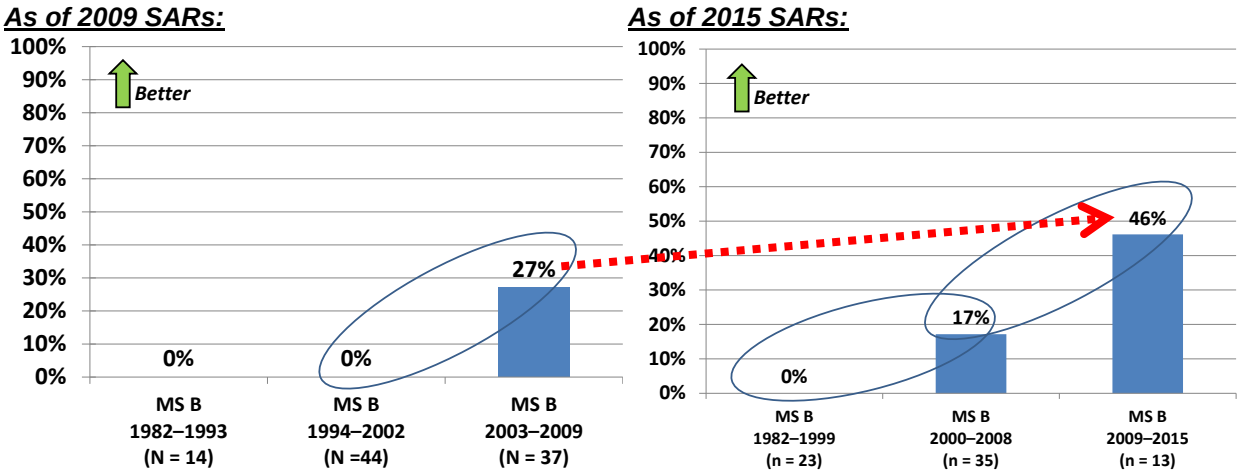
Figure 2-17 plots total RDT&E funding growth (past and planned) relative to the original MS B baselines of all currently active and completed MDAPs by their original MS B date. As before, we controlled for maturity by removing newer programs.

Figure 2-17. Program Cost-Related Performance: Development

Cumulative Growth Over Original MS B Baseline of MDAP Planned Total (From Start to Completion) RDT&E Funding (Controlled for Maturity; CY 1997–2015)

NOTE: This measures total RDT&E funding growth independent of procurement funding and quantity changes; it reflects any work-content changes. These are percentage changes after adjusting for inflation from original MS B baseline of actual past and estimated future funding as reported in each program's latest SAR. Not shown are relatively new programs that have not spent at least 30 percent of their original EMD. Program abbreviations are defined in Appendix F starting on p. 159.

504 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING



There is an apparent recent improvement in Figure 2-17, but it is not statistically significant when testing back to 1997; the variation explained by any potential trend (i.e., the R^2) was too low.

However, we did find that recent programs are, in fact, improving when using a proportion test comparing programs started since 2009 to earlier programs. Figure 2-18 shows the result of separating the active MDAPs based on program start date (i.e., their original MS B date) as of the 2015 SARs. After deleting immature programs (i.e., those that are too new to know the magnitude of potential problems), we find that the recent proportion of active MDAPs showing reductions (negative funding growth from original MS B baseline) in total RDT&E is higher statistically at 46 percent for the period since 2009 than at 17 percent for the prior period of 2000–2008. This result is somewhat weaker than last year, when the recent bin was 57 percent instead of 46 percent, but one program last year just below zero has risen to just above zero, and another program left the sample size (now 13).

To help test whether this is just a result of any remaining maturity bias, we conducted the same proportion test using earlier 2009 SARs and the same time windows shifted earlier. While the later proportion (2003–2009) was significantly higher at 27 percent than the then-prior 9 years (1994–2002) at zero percent, the reduction magnitudes were lower than what we see now in the 2015 SARs. Thus, while the proportions show some maturity bias, there is evidence that the overall levels in 2015 are higher than in 2009 and that recently started MDAPs are controlling development funding better.

Figure 2-18. Reductions to Planned Program Funding: Development

Proportions of Active MDAPs With Reductions Since Original MS B Baseline in Cumulative Planned Total (From Start to Completion)
RDT&E Funding (Program Basis; Controlled for Maturity)

NOTE: This reflects total RDT&E funding growth independent of procurement funding and quantity changes; it reflects any work-content changes. Statistically significant differences between adjacent periods are marked with an oval. A program shows a reduction if current total RDT&E funding is under original MS B baseline. Relatively new programs that have not been through at least 30 percent of their original EMD schedule are not included to help control for low maturity.

505 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

Conceptually, various factors may be at work here. Recent initiatives (e.g., WSARA 2009; BBP initiatives, including Should-Cost and improved contractor cost control) may indeed be leading to better-structured, better-managed, and more cost-effective programs. These factors should lead to reductions in RDT&E (whether motivated initially by budgetary pressures or as a result of savings or avoidance realized), and data at the contract level later in this chapter show we indeed are reducing RDT&E growth significantly. Also, we might be seeing reductions due to budget cuts with content adjustments. For example, engineering and design requirements may be moderating, enabled by actions from the PM and Configuration Steering Boards and reinforced by affordability analysis. In addition, baselines themselves may be more realistic recently for any number of reasons—better data for cost estimating, more realistic assumptions, lower risk taking at inception, or less optimistic setting of baselines by program MDAs. Recall, for example, that analysis in last year's report inferred a downward trend in risks on early production contracts but not on development contracts (see USD(AT&L), 2015b, pp. 109–114). (Note that we discuss baseline realism below starting on p. 92 as a possible driver of budgetary effects on cost growth.) We cannot directly identify causes of the changes, but we are encouraged that more programs project total needed funding below baselines.

CYCLE TIMES AND SCHEDULE GROWTH: DEVELOPMENT

Warfighting capabilities must not only have the needed technical performance but must be delivered in a timely fashion to address operational threats. Thus, the acquisition system must be responsive in time while addressing cost and technical performance. Cycle time—between the identification and fielding of a need—therefore continues to be an area of concern in our BBP initiatives and elsewhere.

Note that we measure cycle time and schedule growth in various ways to gain insight into schedule-related performance. One is whether we include recent programs that are still active or have not yet achieved the metric's end point (e.g., IOC). Including all programs provides some insight into recent trends but may involve some level of maturity bias (i.e., may not reflect final results). Another metric difference is whether we measure differences in years or percent. The latter provides perspective on the relative magnitude of the change compared to the total length, but note that percent scales differ below and above zero. The lowest negative value is −100 percent, while the largest positive value approaches infinity. Thus, −10 percent and +10 percent are not true inverses, and statistics such as the arithmetic mean can be misleading when both negative and positive values are present in the distribution.

MDAP Cycle Time: MS B or C to IOC

We analyzed planned and actual cycle times for the 100 MDAPs that reported achieving IOC (or some similar benchmark) in the SARs since 1997. Table 2-9 summarizes the average portfolio cycle time for these MDAPs. For MDAPs without an MS B/II, we used MS C/III dates. Not included are some MDAPs with complicated schedule reports where there were no clear or consistent IOC-related dates.

506 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

Cycle times for these programs that achieved IOC grew across the portfolio by about 10 percent (8 months for a nominal 7 year program) compared to original plans. Note that most of the shortest programs were started at MS C (i.e., used mature technology), but some programs that started at MS B also had short EMDs and probably leveraged relatively mature technology. Also, the six longest programs (shown) all began at MS B and involved EMD.

Table 2-9. Average Portfolio Cycle Time (from MS B/C to IOC) for MDAPs Past IOC (1997–2015 SARs)

	Median	Mean	Count	IQR	Standard Deviation	Min	Max
	(years)	*(years)*	*(n)*	*(years)*	*(years)*	*(years)*	*(years)*

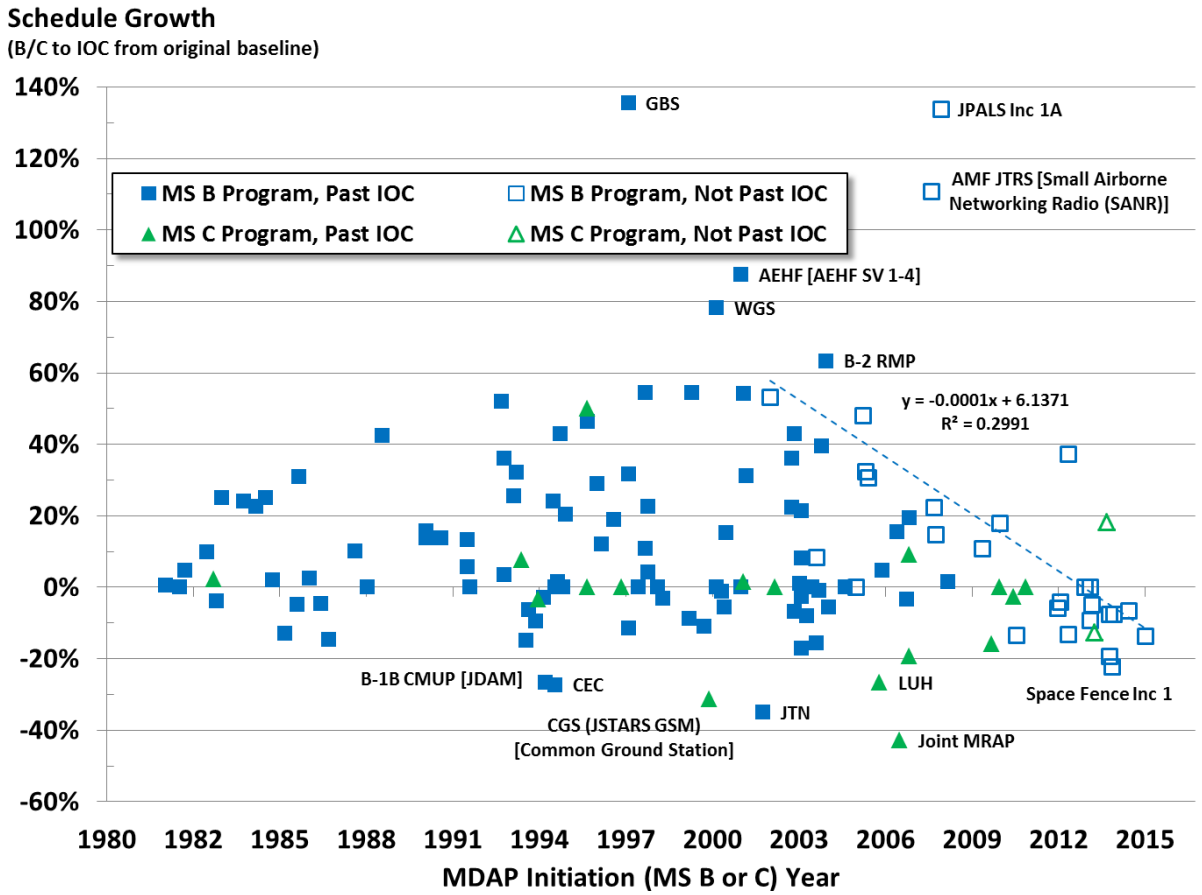
F-35 [F-35 Aircraft]	MS B	13.8
AEHF [AEHF SV 1-4]	MS B	13.8
MQ-8 Fire Scout	MS B	14.2
F-22	MS B	14.5
Excalibur	MS B	14.6
ATIRCM/CMWS [ATIRCM QRC]	MS B	14.8

NOTE: The 1997–2015 SARs include MDAPs with Milestone B/C dates as early as FY 1979 and IOC dates up through FY 2015. Programs abbreviations: Joint Tactical Network (JTN).

MDAP Schedule Growth: MS B or C to IOC



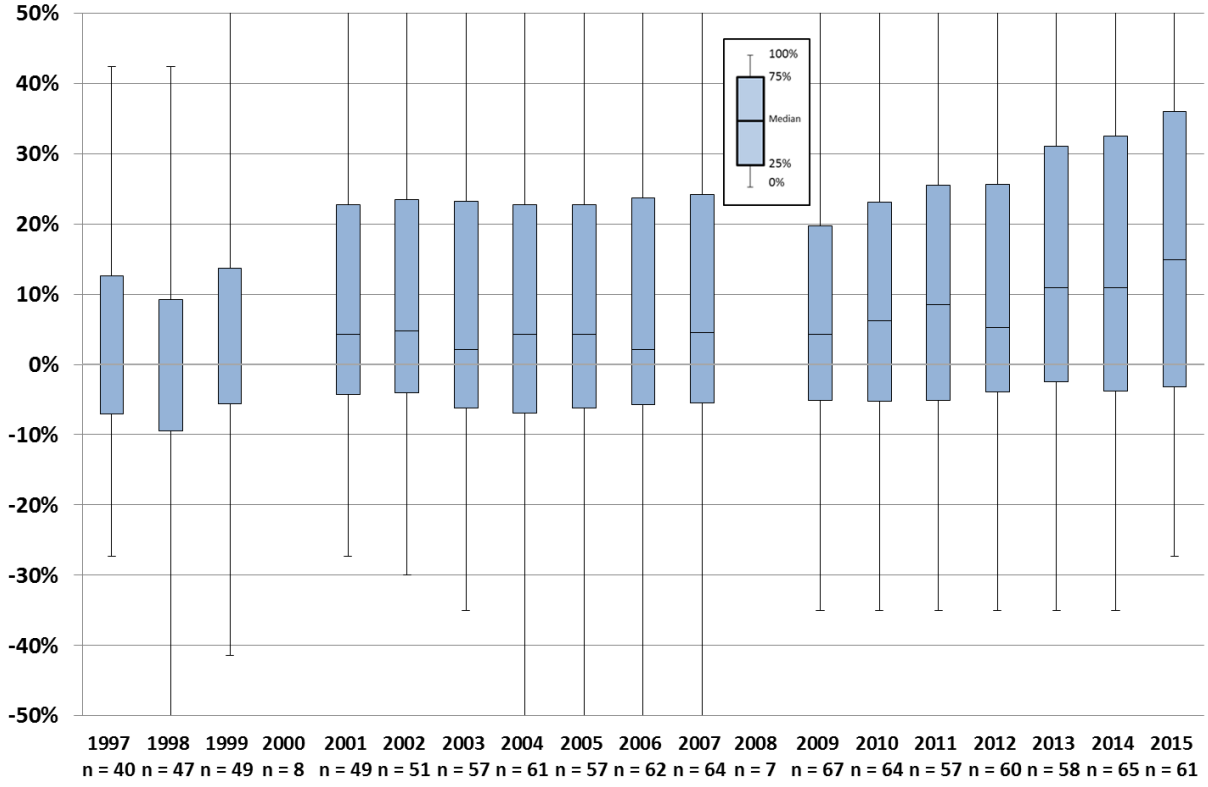
We now assess MDAP cycle time and schedule growth from CY 1997–2015 using SAR data. This includes two types of MDAPs: Programs that had an MS B, and programs with more mature technology that did not have an MS B but instead started at MS C.

Figure 2-19 shows the schedule growth (MS B/C to IOC relative to original baseline) by program start date (MS B or C). Across all MDAPs since 1981 (active and completed), there was no statistically significant trend in B/C to IOC schedule growth when plotting by program start (MS B or C). The overall median was 0 percent for these programs as of the 2014 SARs, but this overall median increased to 1 percent as of the 2015 SASs. This increase between 2014 and 2015 was largely driven by growth in the following programs: OCX, DDG 1000, JLTV, and LCS MM (despite an 18 percentage point drop in PAC-3 MSE).

507 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

We did find a statistically significant downward trend for recent MS B programs that have not yet passed IOC (see the open blue boxes and the downward line on the right side of Figure 2-19). It explains about 29 percent of the variation in the data, but it is unclear whether this trend is due to a maturity bias for these newer programs or whether recent programs are performing better on schedule.

Figure 2-19. MDAP Schedule Growth from MS B or C to IOC (Original Baseline; CY 1981–2015)



NOTE: The only statistically significant trend is for MS B programs not past IOC; it has a downward trend with an R-squared of 29 percent (i.e., explains 29 percent of the variation). It is unclear whether this trend is due to program immaturity bias or better schedule performance on recent programs. Program abbreviations are defined in Appendix F starting on p. 159.

When just looking at active programs being reported in annual SARs since 1997, we found an increasing trend in median B-to-IOC schedule growth when weighing all programs equally (see Figure 2-20). Schedule growth in CY 2015 was statistically higher than it was in 1997–1999 and 2004–2005. However, when we weigh longer programs more than shorter programs (analogously to the way we weigh cost growth by program dollar size), the portfolio medians have been flat (recall Figure H-10). Thus, schedule growth generally appears to be concentrated on shorter programs. We also found that shorter programs tended to have higher schedule-growth percentage variation than longer programs (i.e., schedule growth in percent versus cycle time is heteroskedastic).

508 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

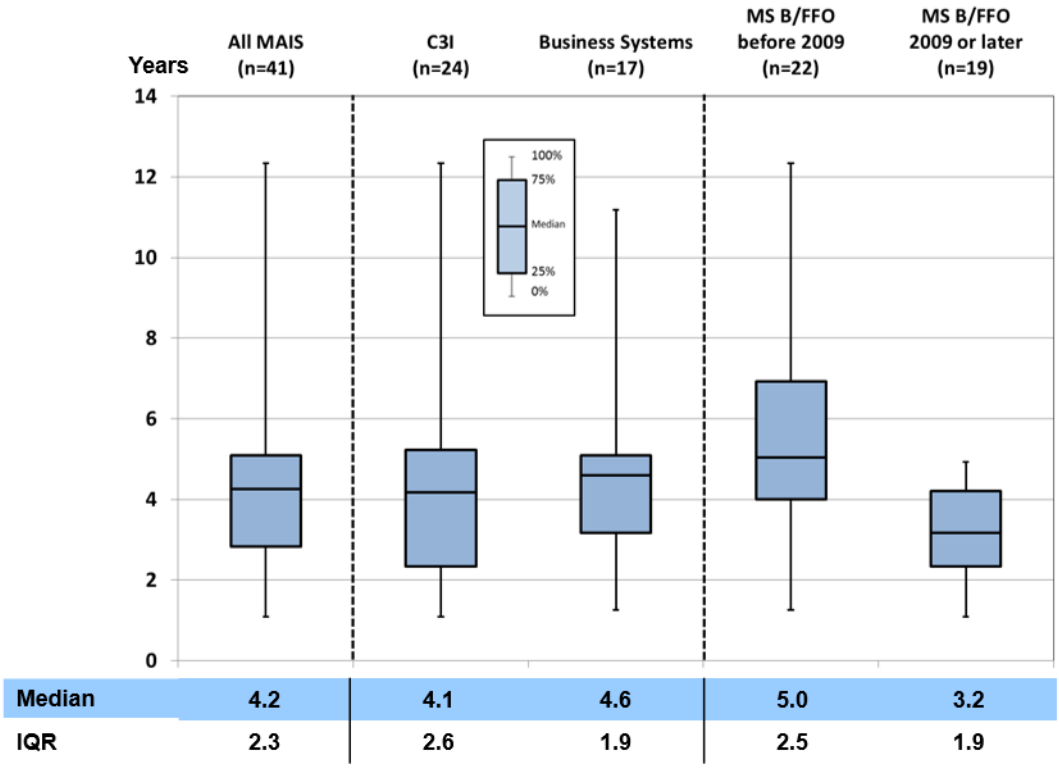
Finally, we examined (but do not show) planned B-to-IOC schedule lengths by MS B date for different commodities (ballistic missile defense, C4ISR, fixed-wing aircraft, ground vehicles, rotary wing aircraft, munitions, satellites, ships, and UAVs). Only satellites had a statistically significant downward trend (with an R-squared of 44 percent) due primarily to three programs from the early 1980s that had much longer planned B-to-IOC schedules.

Figure 2-20. Median MDAP Schedule Growth for Active Programs (MS B to IOC From Original Baseline; SAR Years 1997–2015)

Median	0.0%	0.0%	0.0%		4.3%	4.8%	2.1%	4.3%	4.3%	2.1%	4.5%		4.3%	6.2%	8.5%	5.2%	10.9%	10.9%	14.9%
IQR	20%	19%	19%		27%	27%	29%	30%	29%	29%	30%		25%	28%	31%	30%	34%	36%	39%
Mean	1.6%	0.0%	3.2%		8.2%	11.0%	9.2%	7.7%	9.1%	9.7%	10.7%		10.4%	12.8%	14.4%	14.6%	16.8%	20.1%	22.1%
Std Dev	16%	18%	18%		20%	25%	26%	28%	29%	28%	29%		26%	27%	28%	29%	29%	37%	35%
Trends	***Lower than 2010-2015***			***No statistically significant trend from 1999-2014. 2015 higher than 1997, 1998, 2004 and 2005.***															

NOTE: Includes active programs regardless of whether they have achieved IOC. Program basis weighted each program equally. There were no complete SARs in 2000 and 2008 due to changes in administration. Growth in CY 2015 is statistically higher (at the 5 percent level of significance) than that in 1997–1999 and 2004–2005.

Interestingly, schedule growth levels in development are lower than cost growth in development. Overall median schedule growth since 1981 for active and completed programs is running at 1 percent, while schedule growth on only active programs has ranged from 0 percent in 1997 to about 15 percent in 2015. In contrast, MDAP program- and contract-level cost growth in development tends to run in the 20 percent to 45 percent range, depending on what measures, data, and adjustments are included.



509 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

MAIS Cycle Times

Figure 2-21 shows MAIS cycle time since 2011 as the number of years for each MAIS from MS B (or the date of FFO) to the FDD in the original estimate (i.e., the first MAR for the MAIS). Similar to last year's results, MAIS programs with MS B or FFO before 2009 had a median cycle time of 5 years; since then, the estimated median cycle times dropped to just above 3 years.[27] In other words, before 2009, half of the MAIS were planned with cycle times longer than 5 years. Since 2009, that estimate has dropped significantly, and no program is planned to take longer than 5 years since MS B or FFO. This may to be a direct result of the legal requirement for Critical Change Reports if the 5-year period is breached. Whether the DoD achieves these estimates and it improves acquisition performance are yet to be determined. Recall that the median schedule growth on all currently reporting MAIS since their original estimate is about 3 months (see Figure 2-10).

Figure 2-21. Program Length: Information Systems

Active MAIS Originally Planned Cycle Time from MS B or FFO to FDD (2011–2015 MARs)

	All MAIS (n=41)	C3I (n=24)	Business Systems (n=17)	MS B/FFO before 2009 (n=22)	MS B/FFO 2009 or later (n=19)
Median	4.2	4.1	4.6	5.0	3.2
IQR	2.3	2.6	1.9	2.5	1.9

NOTE: Original estimates are those in the MAIS' first MAR. Included are the latest data on programs that appeared in at least one MAR from 2011 through 2015. Boxes show second quartile, median, and third quartile; bars show first and fourth quartiles, minimum, and maximum. The IQR is the difference between the 75th and 25th percentiles. Immature programs that have not completed at least 30 percent of their original EMD schedule time were excluded to help control for maturity.

[27]Many MAIS increments have an MS B but not MS A, so we have more consistent data using MS B. For comparison, 5 years since MS A or FFO (not MS B as shown here) to FDD is the statutory threshold beyond which a certification of variance is required. The end points of the 5-year period have changed over the years, but it is currently from MS A or Preferred Alternative Decision to FDD.

510 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

The optimal cycle time cannot be predetermined absent information on the system in question. In some cases, long cycle times may be a concern given how fast information technology advances. On the other hand, setting arbitrary schedule deadlines may incentivize undesirable management decisions and risky shortcuts, causing failures to meet end user needs and possibly increasing costs for subsequent upgrades.

COST PERFORMANCE: PRODUCTION

Program Production Funding Growth (Quantity Adjusted)

Now examining production at the program level, the following figures summarize the unit procurement funding growth across the MDAP portfolio from the original MS B baseline and biennial changes. These use recurring unit flyaway funding data reported in the SARs and are adjusted for quantity changes since the MS B baseline.

These program-level data are for measures that (unlike PAUC and APUC) are fully adjusted for any changes in procurement quantity. These results help compare procurement unit costs at the initially estimated quantities, extrapolating data if quantities have been reduced. This approach provides a superior way of comparing what the units would have cost if we had not changed quantities by, essentially, measuring the shift in the procurement cost-versus-quantity curve from planned to actual.[28] In other words, we measure changes in procurement cost at the currently planned quantity to be purchased (often lower than the initial) *and* assume that the original planned quantity still was being purchased. This approach allows us to examine on a unit basis the cost of the capability to acquire those units regardless of whether we increased or decreased quantity. Of course, quantity decreases may be due to unit-cost increases, and this approach will show such cost increases clearly.

Similar to the prior RDT&E results, growth distributions in production are highly skewed, with arithmetic means higher than the medians. As noted elsewhere for the contract-level data, the overall magnitudes of production funding growth are not nearly as large as those for RDT&E. There also is considerable variability in the production funding growth across the MDAP portfolio.

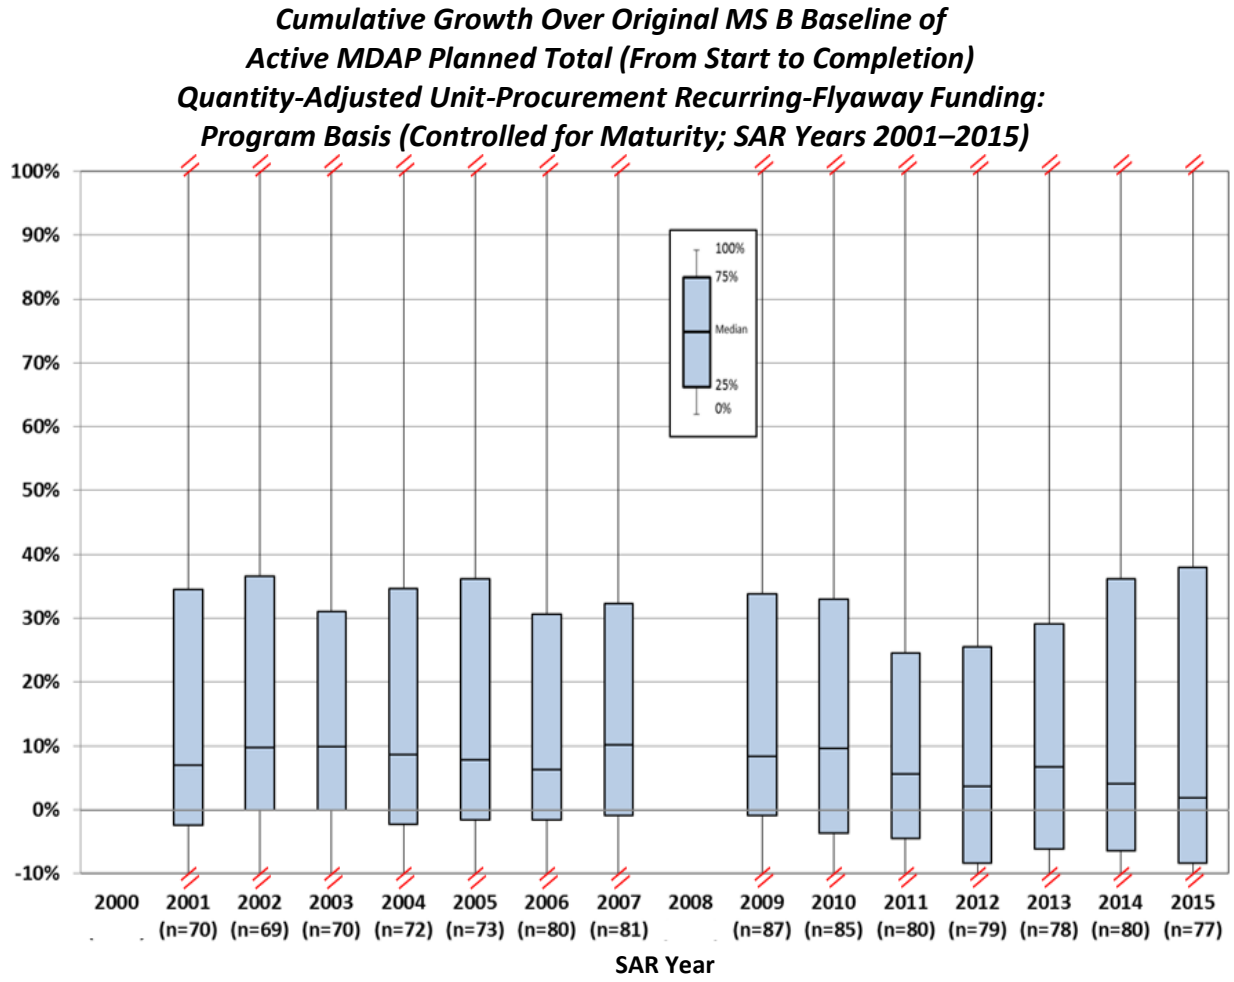


Figure 2-22 shows quantity-adjusted procurement cumulative unit-funding growth over original MS B baseline for each year's MDAP portfolio on a program basis (controlled for program maturity). As with last year's results, growth has been statistically flat since at least 2001, although the median has dropped in 2014 and 2015 and now runs about 2 percent—the lowest value measured in the years 2001–2015. Figure 2-23 shows that on a dollar basis (i.e., weighted by program size in dollars), the quantity-adjusted unit-funding growth since 2009 is statistically

[28]This basic approach for quantity adjustment is one of the standard techniques employed by the cost analysis community—see, for example, the discussions in Hough (1992), Arena et al. (2006, pp. 5–6), and Younossi et al. (2007, pp. 13-14).

511 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

lower than in prior years (2001–2007). Moreover, 2015 is statistically lower than 2014, with a median that was cut in half and now runs 4 percent, which like the program basis is the lowest value measured in the years 2001–2015. Given these are based on budget data, one would be concerned that this might just reflect budgetary pressures on programs, but these procurement measures are adjusted for any quantity changes, so regardless of the budget changes they should be reflecting actual reductions in unit costs.

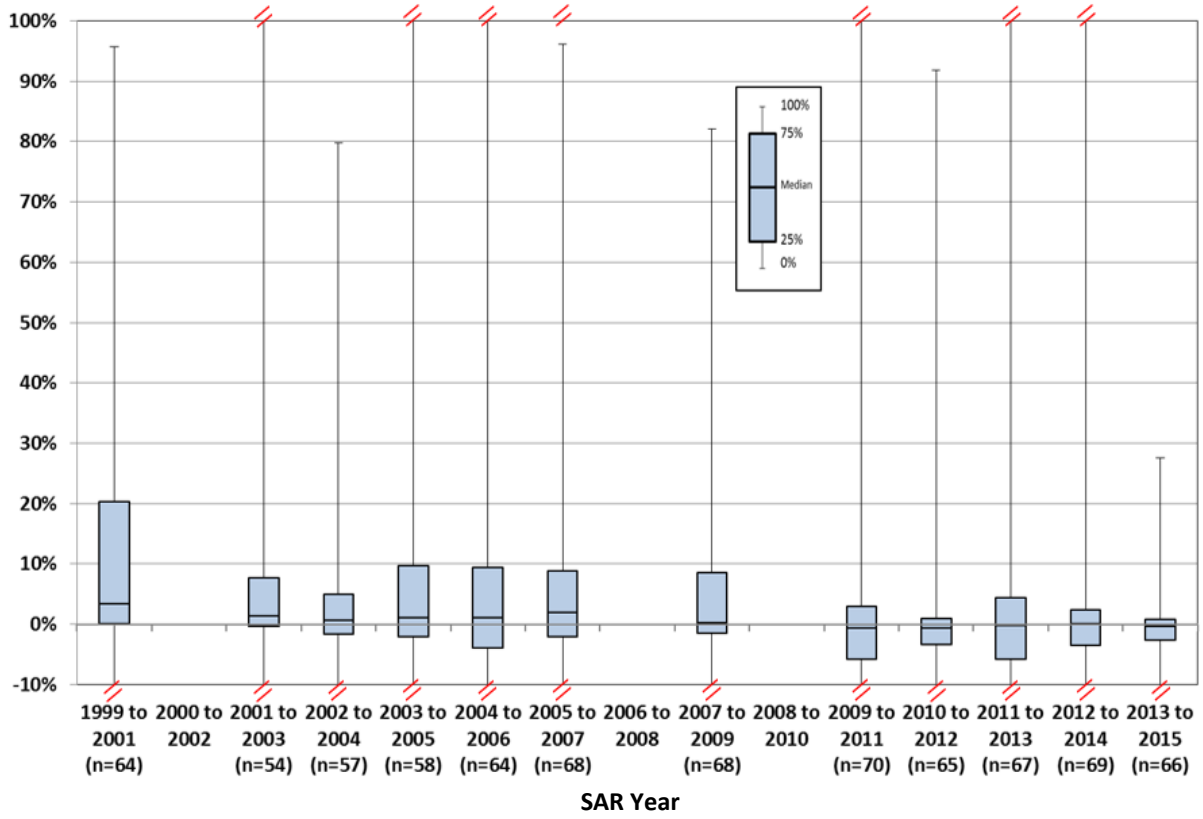
514 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING



Biennial Funding Changes: Production

Figure 2-25 shows biennial changes in total quantity-adjusted unit procurement funding (actual and planned), controlling for program maturity. The most recent biennial period of 2013–2015 and the two periods 2009–2011 and 2010–2012 are statistically lower than the years 2001–2009. Thus, the most recent period has shown an improvement. Figure 2-26 shows total quantity-adjusted unit procurement funding, but on a dollar basis. On a dollar basis, the years 2009–2015 are lower than prior years. In both bases, the median unit funding growth has been zero or less since 2009, but the variation (as measured by IQR) has improved (tightened) by half from 2014 to 2015.

518 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

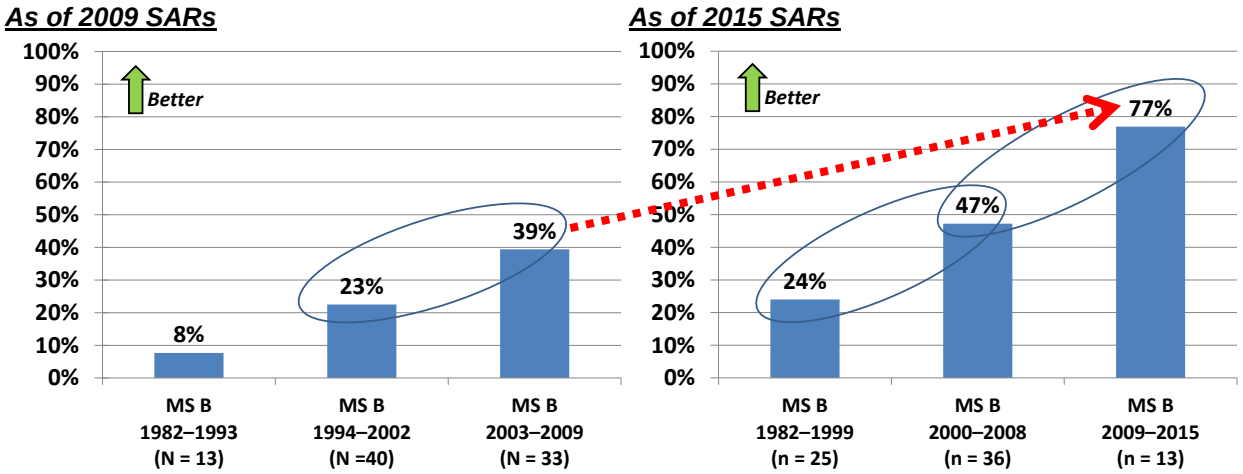
Program Funding Growth by Start Date: Production

Finally, as for development, we examine program procurement performance based on initiation date. Figure 2-28 plots quantity-adjusted procurement unit funding growth of all active and completed MDAPs by their original MS B date. As before, we controlled for maturity by removing newer programs.

Figure 2-28. Program Cost-Related Performance: Procurement

NOTE: This shows growth in unit recurring flyaway funding after adjusting for quantity changes; it is independent of RDT&E funding but reflects any work-content changes. These are percentage changes after adjusting for inflation and any quantity changes from original MS B baseline of actual past and estimated needed future funding as reported in the programs' latest SARs. Relatively new programs that have not spent at least 30 percent of their original EMD schedule are not shown. Program abbreviations are defined in Appendix F starting on p. 159.

Again, there is an apparent recent improvement, but it is not statistically significant when testing back to 1997; the variation explained by any potential trend (i.e., the R^2) was too low.



519 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

However, as in development, we did find in production that recent programs are, in fact, improving when using a proportion test comparing programs started since 2009 to earlier programs. Figure 2-29 shows the result of separating the portfolio of active MDAPs based on program start date (i.e., their original MS B date). After deleting immature programs (i.e., those that are too new to reveal the magnitude of potential problems), we find that the proportion of active MDAPs showing quantity-adjusted unit procurement reductions (negative funding growth from original MS B baseline) is significantly higher at 77 percent since 2009 than the 47 percent for 2000–2008. Last year, the results were similar at 79 percent and 44 percent, respectively.

To help test whether this is just a result of any remaining maturity bias, we conducted the same proportion test using earlier 2009 SARs. While the proportional differences were also significant, the percentages were lower than what we see now in the 2015 SARs. Thus, as in development, there is evidence that this is not just a maturity bias; MDAPs started since 2009 are performing better in production at controlling cost. This may be a result of our affordability caps on MDAP production costs. In addition, the Should-Cost BBP initiative was introduced in 2010.

Figure 2-29. Reductions to Planned Program Funding: Procurement

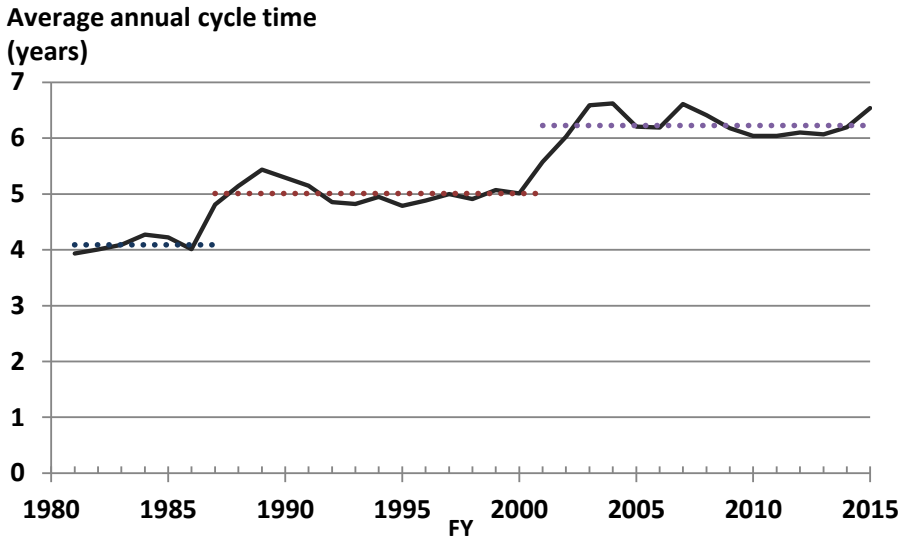
Proportions of Active MDAPs With Cost-Related Reductions Since Original MS B in Cumulative Planned Total (From Start to Completion)
Quantity-Adjusted Unit-Procurement Recurring-Flyaway Funding
(Program Basis; Quantity Adjusted; Controlled for Maturity)

NOTE: This shows growth in unit recurring flyaway funding after adjusting for quantity changes; it is independent of RDT&E funding but reflects any work-content changes. Statistically significant differences between adjacent periods are marked with an oval. A program shows a reduction if current total unit funding is under original MS B baseline after adjusted for quantity changes since MS B baseline. Relatively new programs that have not been through at least 30 percent of their original EMD schedule are not included to help control for low maturity.

Conceptually, two behaviors different than those in development may be at work here if these are related to budget cuts instead of better program initiations. First, if quantity was reduced on an MDAP to accommodate budget reductions, we would see an increased unit funding. However, we adjusted unit funding for any quantity changes and still saw reductions.

520 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

Therefore, a reduction in this case would be real. Second, if the production rate decreased due to budget cuts, the learning curve theoretically would decrease, as well. Our adjustment for quantity directly compares the initial estimated learning curve against the latest curve, so we would see this as an increase, not a decrease. The reductions we see in the data are real, and they do correlate well to the management actions taken under BBP. The data do not provide a basis for conclusively assessing cause and effect, but the trend is very encouraging.



CONTRACT-LEVEL CYCLE TIMES AND SCHEDULE GROWTH: DEVELOPMENT AND EARLY PRODUCTION

Cycle Time Trends: Development Contracts

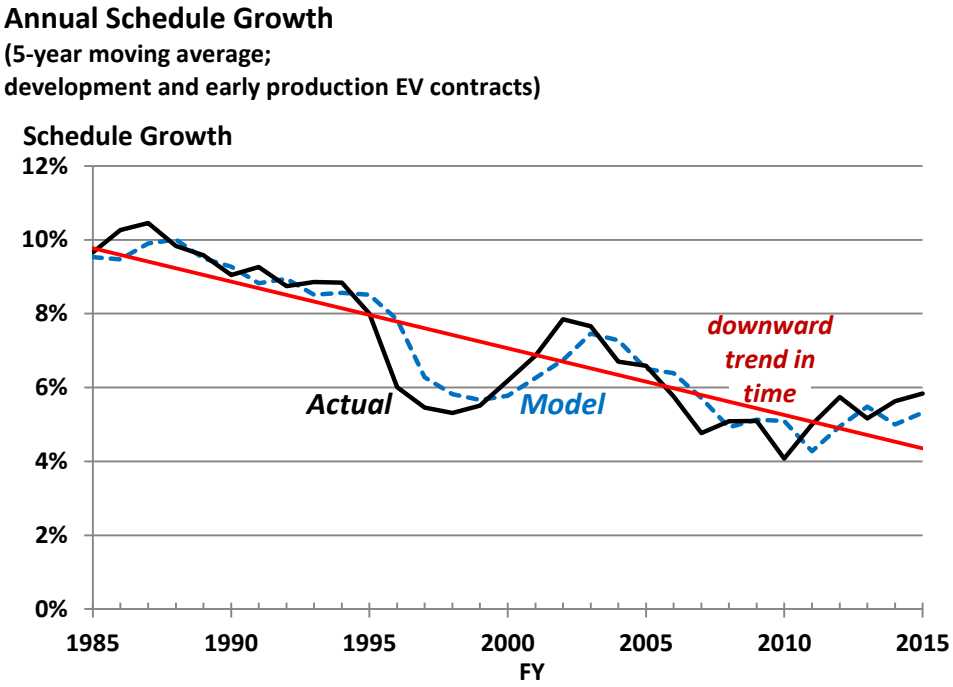
Using EV reports from FY 1981–2015, we examined planned cycle times for major MDAP development contracts. Planned cycle time in this contract analysis is defined as the annual average of the original schedule for major executing MDAP contracts in each year. These included development contracts only (unweighted by program size), approximating the time from inception to when operators first begin getting units into the hands of the operator (neglecting significant concurrency with procurement).

These data show that the average annual cycle time has increased in two steps from about 4 years in 1981 to about 5 years in the 1990s to just over 6 years since 2001 (see Figure 2-30). This "active portfolio" measure is different than measuring cycle time by contract start date, which prior analysis in last year's report showed a downward trend from 2001–2013 (although the medians was similar at about 6 years). This may be an effect of longer contracts remaining in the active portfolio. Regardless, such cycle-time measures do not reflect the realistic time associated with an effort, given the scope and maturity of available technology. Schedule growth therefore is a better metric in that regard.

Figure 2-30. Average Annual Development Contract Cycle Time (FY 1981–2015)

NOTE: 9,582 earned-value reports on 472 major development contracts for 190 MDAPs.

521 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING



Schedule Growth Trends

We analyzed schedule growth on development and early production contracts reporting EV from FY 1985–2015. These data summarize 18,470 earned-value reports on 1,123 major contracts for 239 MDAPs.

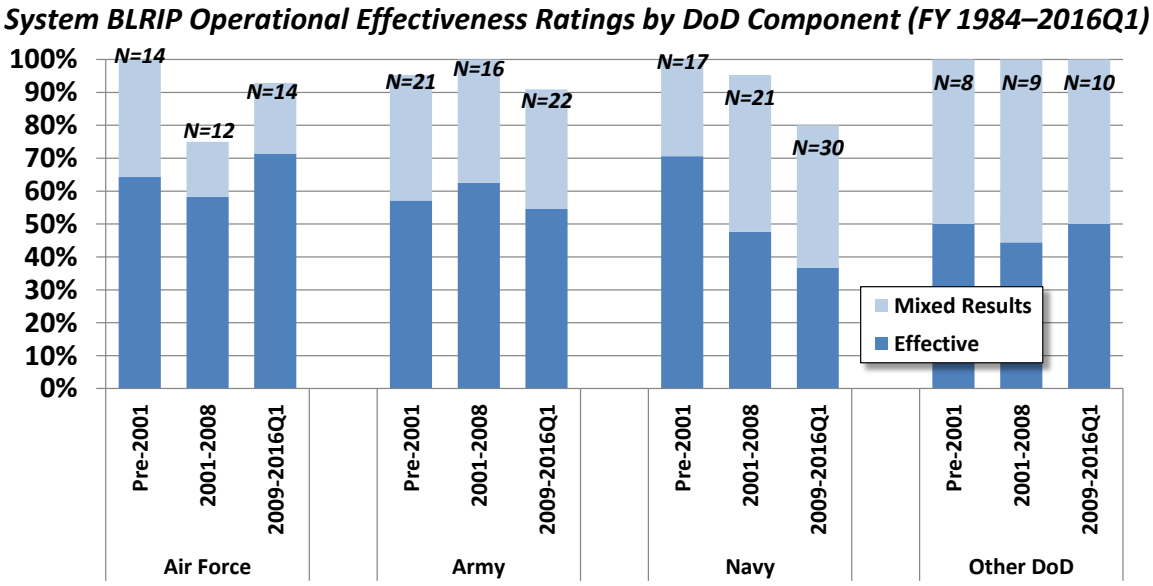
Our statistical model shows that the 5-year moving average of annual growth of contracted costs is closely modeled by a downward trend over time together with a self-correction function that adjusts for prior random deviations from this downward trend. Details on this statistical model are in the latter part of Appendix B starting on p. 148.

Therefore, we have strong longitudinal evidence of declining schedule growth on MDAP development and early production contracts over the past three decades. This contrasts with the program-level data on schedule growth from MS B/C to IOC, which showed no trend (see p. 46).

Figure 2-31. Statistical Model Fit to Actual EV Contract Schedule Growth (FY 1985–2015)

NOTE: 18,470 EV reports on 1,123 major contracts for 239 MDAPs.

INSTITUTIONAL ANALYSES: MILITARY DEPARTMENTS



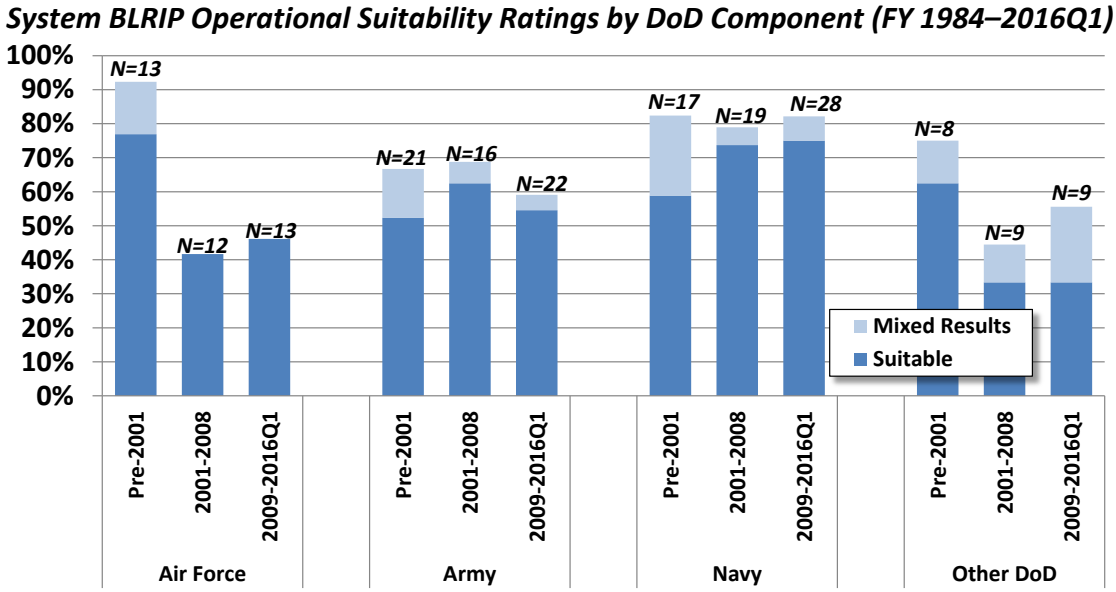
This section summarizes various acquisition performance metrics analyzed by DoD Component. Here we examined significant program-level cost growth as exhibited by Nunn-McCurdy breaches as well as contract-level cost, price, and schedule growth.

522 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

Operational Testing of Effectiveness and Suitability by DoD Component

Figure 2-32 shows effectiveness ratings for the DoD Components during BLRIP operational tests. There are no statistically significant trends in the data, although some differences can be seen. Also, DOT&E testing policies and procedures changed in FY 2000 and 2005, further complicating comparisons between these periods.

Figure 2-32. System Operational Test Performance: Effectiveness by DoD Component



Source: DOT&E reports.

NOTE: Differences are only apparent and may not be significant due to the low sample sizes (infrequent evaluations). DoD programs were Joint or other programs that are not exclusive to a single DoD Component. Sample sizes differ between effectiveness and suitability for some DoD Components because there was not always a definitive binary judgment for effectiveness and suitability in all reports.

Figure 2-33 shows suitability test results. Overall, the performance of systems across DoD Components is much lower for suitability than for effectiveness. Again, any apparent trends are not statistically significant.

523 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

Figure 2-33. System Operational Test Performance: Suitability by DoD Component

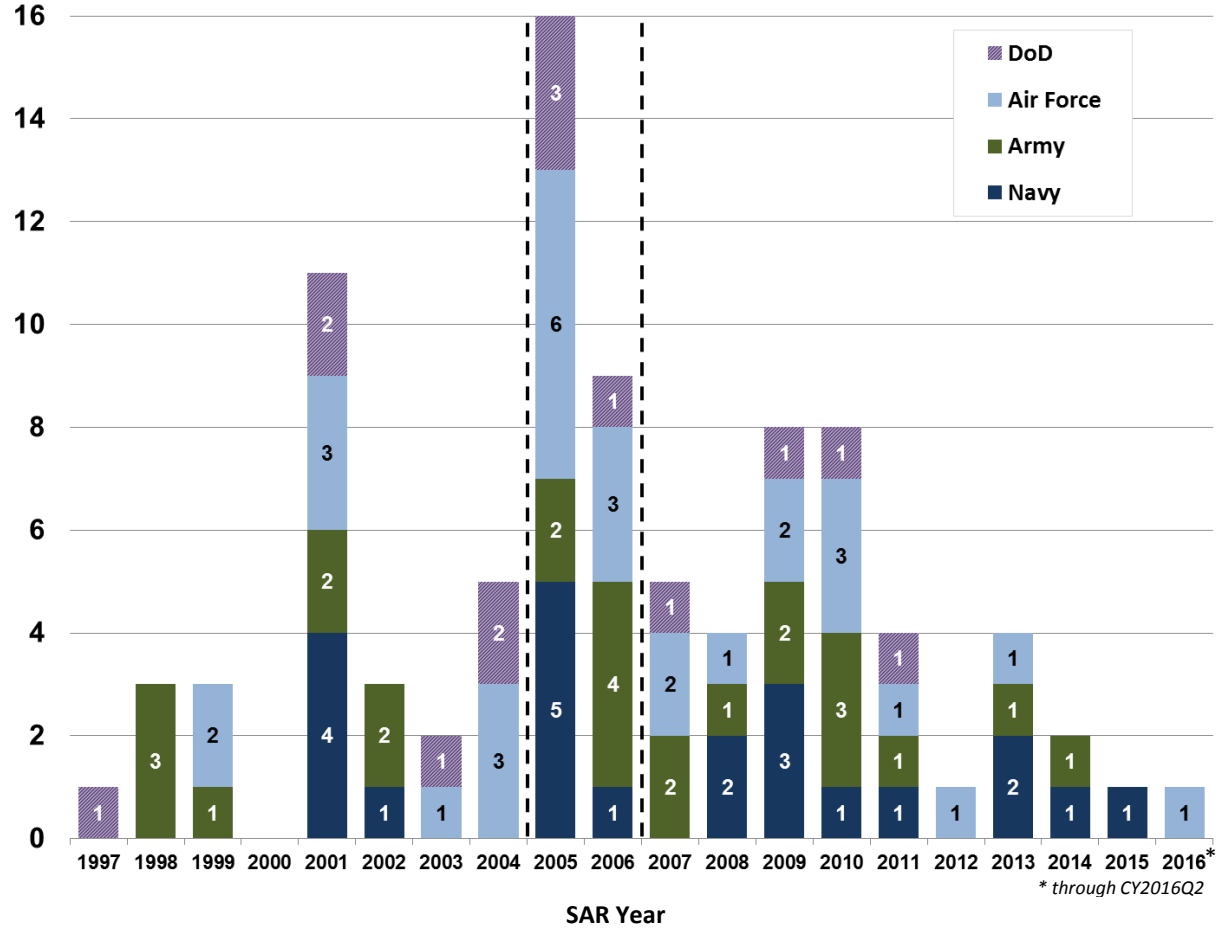
NOTE: Differences are only apparent and may not be significant due to the low sample sizes (infrequent evaluations). DoD programs were Joint or other programs that are not exclusive to a single DoD Component. Sample sizes differ between effectiveness and suitability for some DoD Components because there was not always a definitive binary judgment for effectiveness and suitability in all reports.



Nunn-McCurdy Cost Breaches

One measure of acquisition program cost performance is the Nunn-McCurdy breach rate by DoD Component. Figure 2-34 shows significant and critical Nunn-McCurdy breach numbers by year from 1997 through the second quarter of CY 2016. As introduced previously, this chart now aligns with the DoD official breach list (Table 2-5 on p. 24 above). There was one breach in each of 2015 and 2016 (through Q2): RMS in the Navy and OCX in the Air Force, respectively.

524 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

Figure 2-34. Program Cost-Related Performance: Nunn-McCurdy Breaches by DoD Component

Nunn-McCurdy Significant and Critical Breaches by DoD Component (SAR Years 1997–2016Q2)

NOTE: The criteria for breaches were changed in NDAA 2006, so the counts before 2005 are different than those since 2006, and 2005 was a transition year and not comparable to either half. Breaches are determined using "base-year" dollars (i.e., adjusting for inflation). This plot includes the number of breaches in each annual SAR cycle, which nominally equates to calendar year but may include updates early in the following calendar year from the President's Budget Request. Breaches in different years for different thresholds or baselines for the same program are included in each respective year. If a program reported both a significant and critical breach in the same year, only one breach is shown here. Nunn-McCurdy breach reporting was established in the NDAA for FY 1982, but the new official Office of the USD(AT&L) list only tracks breaches back through 1997.

525 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

Table 2-10 summarizes a different analysis of Nunn-McCurdy breaches by DoD Component. Here we do not "double count" programs that have breached multiple times. This allows us to get a sense of the tendency of programs to breach within each DoD Component.

Historically, about a third of MDAPs breached at least the significant threshold (i.e., about two-thirds have cost growth below 15 percent). At least two-thirds of programs that breach at the significant level eventually also breach the critical threshold (i.e., fewer remain at the significant level), except for Army programs, which are more evenly split between significant- and critical-breaching programs.

All breaches are listed regardless of cause. If a program had both a significant and a critical breach, it was included only in the "programs with critical breach" column.

As discussed in the earlier Nunn-McCurdy breach section, there are various causes of these breaches.

Table 2-10. Nunn-McCurdy Breaches by DoD Component

Nunn-McCurdy MDAP Breach Rates by DoD Component (SAR Years 1997–2016Q2)

Component	Total # of Programs	# of Programs that Ever Breached	Breach Rate	# of Programs with at Most a Significant Breach	# of Programs with a Critical Breach
DoD	12	7	58%	1	6
Army	56	18	32%	8	10
Navy	64	17	27%	6	11
Air Force	57	16	28%	3	13
Total	**189**	**58**	**31%**	**18**	**40**

NOTE: The list of MDAPs by DoD Component has been revised slightly since last year's report to align with the new official list. If a program had both a significant and critical breach, it was included only in the "programs with critical breach" column. The data are not adjusted for quantity or other variances. "DoD" programs are programs categorized as such in the SARs, which include Joint programs and programs (such as Chem Demil) overseen by an organization other than the Air Force, Army, or Navy. Breaches are determined using "base-year" dollars (i.e., adjusted for inflation).

526 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

Program Cost Growth and New Statutory Penalties

Section 828 of the FY 2016 NDAA (Pub. L. 114–92) enacted a new cost-growth calculation and associated penalty for each of the military departments. For each year beginning with FY 2015, the Secretary of each military department shall pay a penalty for cost overruns on the covered MDAPs of the military department. Programs and subprograms included are those with an original APB dated on or after May 22, 2009 (which is the enactment date of the WSARA of 2009). This includes, for example, the F-35 program because it received a revised original baseline due to its Nunn-McCurdy breach after the passage of WSARA.

The "overrun" is defined as the difference between the Current Estimate PAUC minus the Original Baseline Estimate PAUC, all multiplied by the current quantity to be purchased. Overruns are summed across all applicable programs and subprograms for each military department. If the cumulative overrun is positive, then the military department is penalized 3 percent of the total overrun calculated that FY. Thus, if overruns continue in future fiscal years, then there will be a 3-percent penalty each FY. Since these results are dollar weighted, large programs (by dollar) have a larger effect than smaller programs.

Table 2-11 shows the result of applying this algorithm to the December SARs from FY 2015. In FY 2015, the departments of the Air Force, Army, and Navy showed net negative overruns (i.e., underruns) of −$24.4 billion, −$0.5 billion, and −$2.8 billion. Large underruns for EELV, F-35 aircraft, and KC-46A dominated the Air Force result. The large overrun from the AH-64E Remanufacture was mostly negated by the large underruns by the Integrated Air and Missile Defense (IAMD) and MQ-1C Gray Eagle for the Army. The large underrun from the F-35 aircraft program was the dominant correction for the large overrun on E-2D AHE for the Navy.

Table 2-12 shows that, in FY 2016, all three departments improved, with lower negative overruns (i.e., underruns) of −$29.5 billion, −$3.8 billion, and −$3.9 billion. Again, large underruns for the EELV, F-35 aircraft, and KC-46A (with other underruns, including a now-underrunning F-35 engine subprogram) dominated the Air Force result. For the Army, JLTV joined IAMD and MQ-1C Gray Eagle in negating the overrun from the AH-64E Remanufacture. The change in JLTV from FY 2015 to 2016 is the result of further cost savings because of the competition for production. The large (and improving) underruns from F-35 aircraft and engine subprograms were the dominant corrections for the large overrun on E-2D AHE for the Navy.

There was no net overrun for any of the military departments in either year and therefore no military department incurred penalties. Thus, all three military departments showed net improvements across their portfolios of programs with original baselines since 2009. This result aligns with our other analysis, indicating that cost growth has improved recently, and it is the programs that started before 2009 that have higher cost growth.

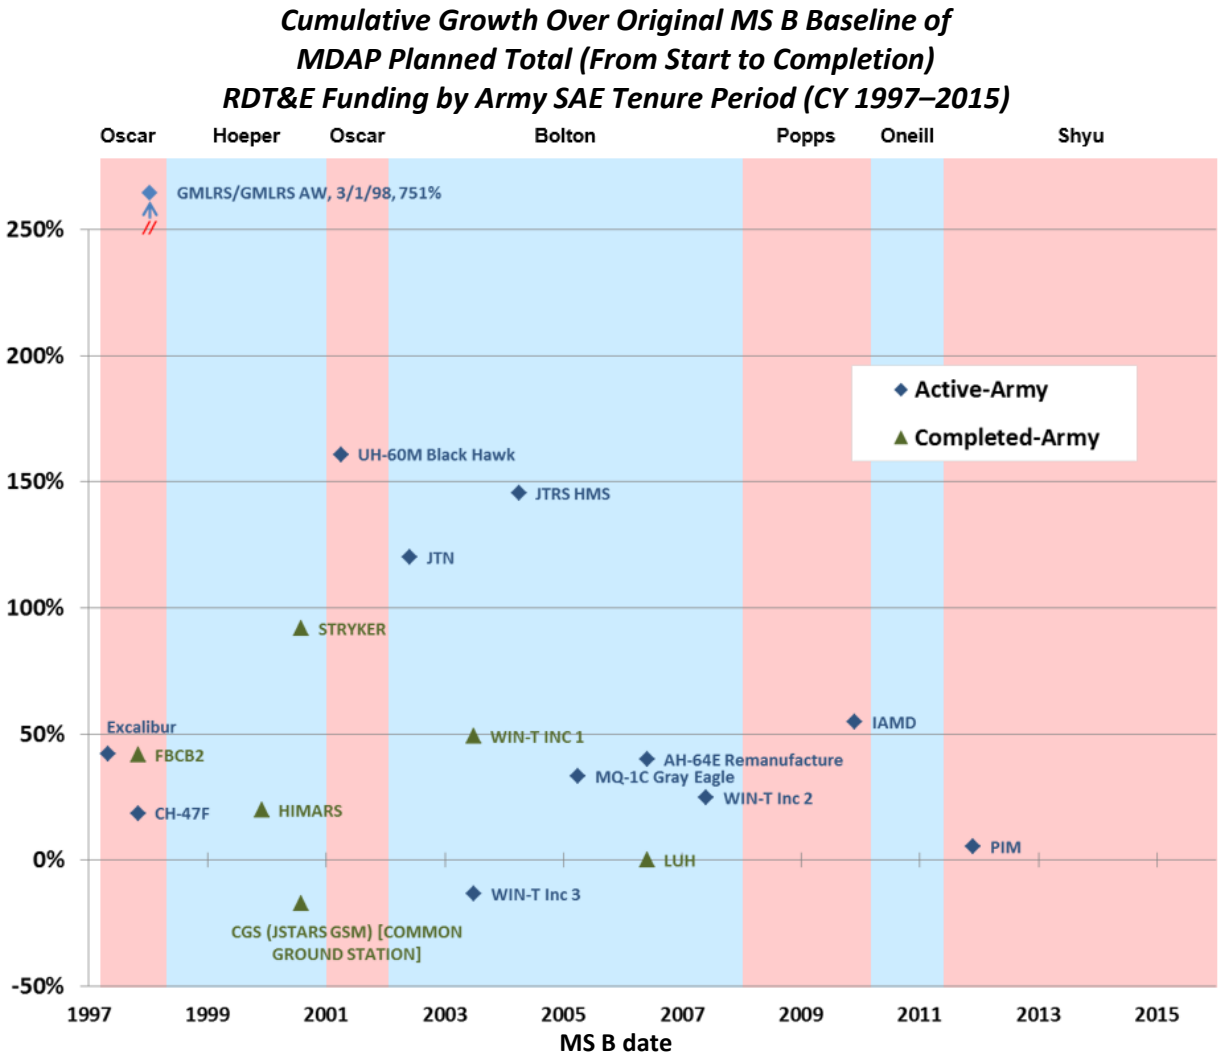
Key: Under-run / Over-run

SOURCE: December 2015 SARs.



NOTE: "Overruns" in this case are defined (by Section 828 of the FY 2016 NDAA) relative to original PAUC baselines at current total quantities. Program abbreviations are defined in Appendix F starting on p. 159.

529 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

Program Cost Growth and Service Acquisition Executives

As with the earlier plots showing DAE tenure periods, we plotted growth in MDAP planned total funding in development and procurement (respectively) for active and completed MDAPs against original baselines as reported to Congress in the SARs, identifying the person who was the SAE at the time of the MDAP's MS B approval. Figure 2-35 shows the result for Army SAEs, Figure 2-36 for Navy SAEs, and Figure 2-37 for Air Force SAEs.

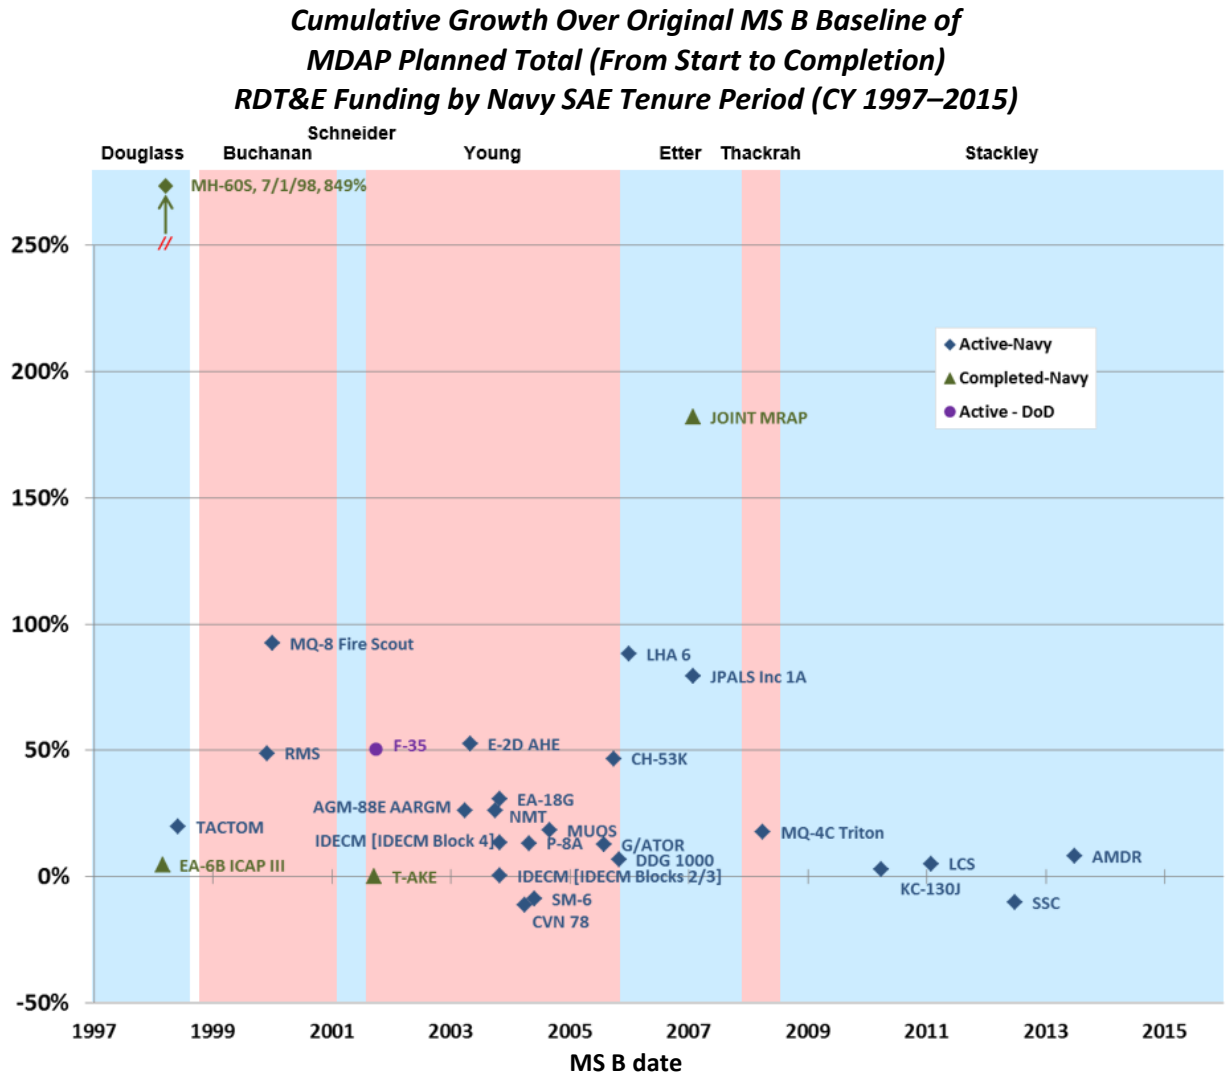


Figure 2-35. Army Program Cost-Related Development Performance Baselined in SAE Periods

NOTE: This shows total RDT&E funding growth independent of procurement funding and quantity changes; it reflects any work-content changes. These are percentage changes after adjusting for inflation from original MS B baseline of actual past and estimated future funding as reported in each program's latest SAR. Total RDT&E is an insightful measure because it is necessary regardless of quantity. Any white bars between SAE shaded regions represent periods in which there was no confirmed executive. Relatively new programs that have not spent at least 30 percent of their original EMD schedule are not shown. Program abbreviations are defined in Appendix F starting on p. 159.

INSTITUTIONAL ANALYSES: PRIME CONTRACTORS

Superior Supplier Incentive Program

As part of BBP, the three military departments and the Defense Logistics Agency (DLA) each established a Superior Supplier Incentive Program (SSIP) to incentivize contractor performance through public recognition. The basis for SSIP designations are contract performance assessments reported by the PM (or equivalent) to CPARS (DoD, 2011). Assessments rate the quality, schedule, cost control, management, utilization of small businesses, and regulatory compliance of the contractor's performance on a specific contract for a specified period. The contractor is allowed to review and comment on each assessment before it is finalized.

In past years, there were some differences between the rating methodologies adopted by each military department, but they have generally refined their approaches each year—with the 2016 SSIP process being nearly uniform. So, the comparisons are not completely equivalent between years, but it is still useful to see how a contractor's performance changes between years. Thus, the SSIP tables were arranged by company in this year's presentation to show more clearly any movement between the years. The three Services use the last three fiscal years of performance data from CPARS to rate the largest firms doing business on systems contracts within each Service (i.e., the 2016 results used FY 2013–2015 CPARS ratings). Ratings are aggregated to a business segment level for scoring. Suppliers without defined business segments are rated at the company level. The ratings are dollar weighted (i.e., contracts with larger dollar obligations in the FY carried proportionally greater contributions to the division's SSIP score for that year). The 3-year results are then time weighted (3,2,1), with the most recently rated year receiving the highest weight, and each successively less-recent year receiving less weight. Company divisions appear or drop off the list between years depending on whether they meet the cutoff criteria in the SSIP algorithm, not based on their performance.

DLA also uses CPARS data to rate their suppliers, but their algorithm may differ somewhat from the methodologies used by the military departments.

Based on the scoring results, the top suppliers are sorted into three tiers. Generally, these tiers separate the list of evaluated company divisions into thirds. In the published list, DLA orders companies alphabetically within a tier rather than ordering company divisions by their quantitative rating. The very top-performing company divisions are in Tier 1 (or Gold for DLA). The Tier 2 (or Silver for DLA) company divisions are the next highest performers. Finally, there are the Tier 3 (or Bronze for DLA) company division performers. Results from the first three SSIP releases are shown in Table 2-13 for Army suppliers, Table 2-14 for Navy suppliers, Table 2-15 for Air Force suppliers, and Table 2-16 for DLA suppliers. Note that these rankings are only for the performance of the company divisions for the specified department or agency, and only for the specified time period.

540 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

Table 2-17 summarizes the number of rating changes between 2015 and 2016. There was more movement by Air Force and DLA suppliers than by Army and Navy suppliers. The number of increases and decreases are not directly comparable, in part, because ratings are not available in both years for all listed company divisions. Generally, this is almost a "zero-sum game" because of the forced distribution of thirds between the levels (i.e., wherein if one company goes up a level then another will come down). This does not always happen, however, because companies (or their business units) can drop or appear in the ratings between years depending on changes in their contracting levels in the areas assessed.

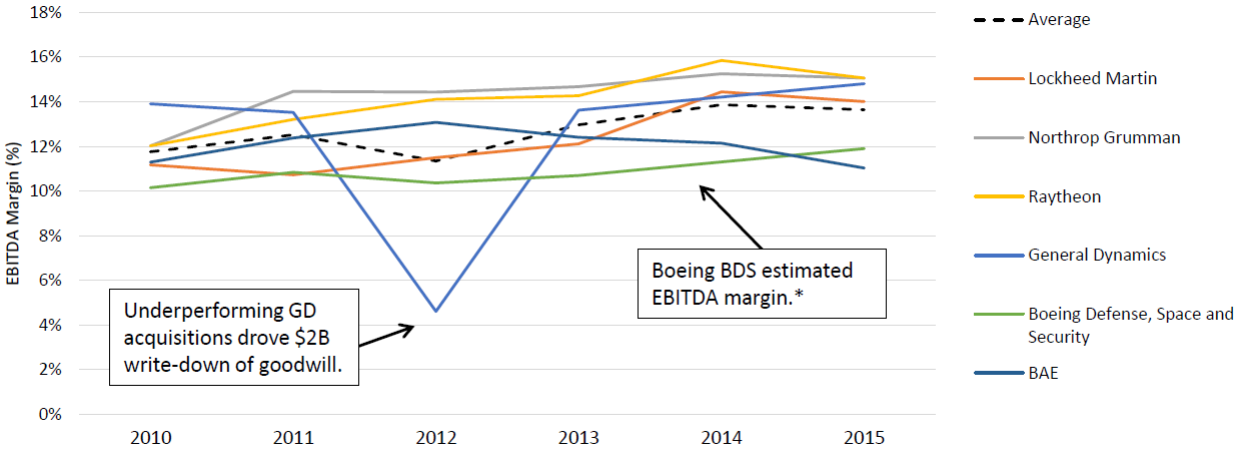
Table 2-17. Count of SSIP Rating Changes by DoD Component Between FY 2015 and 2016

DoD Component	Number of Changes			
	++	+	–	– –
Army		4	3	1
Navy		4	6	
Air Force	1	9	6	1
DLA	1	6	4	2

++ increase by 2 levels
+ increase by 1 level
– decrease by 1 level
– – decrease by 2 levels

DoD Prime Contractor Profitability

One of the initiatives in all three editions of BBP works to ensure that the DoD is paying reasonable prices by tying contractor performance and risk to profit/fee. At the individual contract level for noncompetitive awards on noncommercial items, we follow the weighted guidelines provided in statutes and regulations. Our prior annual reports included institutional analyses across populations of contracts to examine actual profits in absolute terms and relative to price- and cost-control performance.



In addition to these analyses of contract data, we have been monitoring operating margins of our prime contractors to ensure that the net effect of these efforts—combined with other issues such as sequestration—is not undermining the health of our industrial base. In addition to the operating margin data published in our 2014 annual report (USD(AT&L), 2014a, pp. 77–79), Figure 2-41 plots the trends in earnings before interest, taxes, depreciation, and amortization (EBITDA)[29] since 2010 for the six largest DoD prime contractors. Generally, these

[29] EBITDA is a measure that attempts to compare cash flow from operations between companies independent of the differences that may ensue from different capital structures as well as decision-dependent actions such as depreciation, amortization, and interest on capital and taxes (see, for example, Constable, 2012; Investopedia, 2016; Reuters, 2016). Note that while widely available, EBITDA has its limitations (see, for example, McClure, 2014).

541 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

primes have performed consistently or slightly better against this measure since before BBP took effect, providing evidence that our BBP efforts have not hurt the profit margins of these companies.

Figure 2-41. Historical EBITDA Margin of the Six Largest DoD Primes (2010–2015)

SOURCE: Company 10-K reports (Bloomberg).
NOTES: EBITDA are earnings before interest, taxes, depreciation, and amortization. Years refer to corporate fiscal years (coinciding with calendar years).

3. EXPANDED ANALYSES

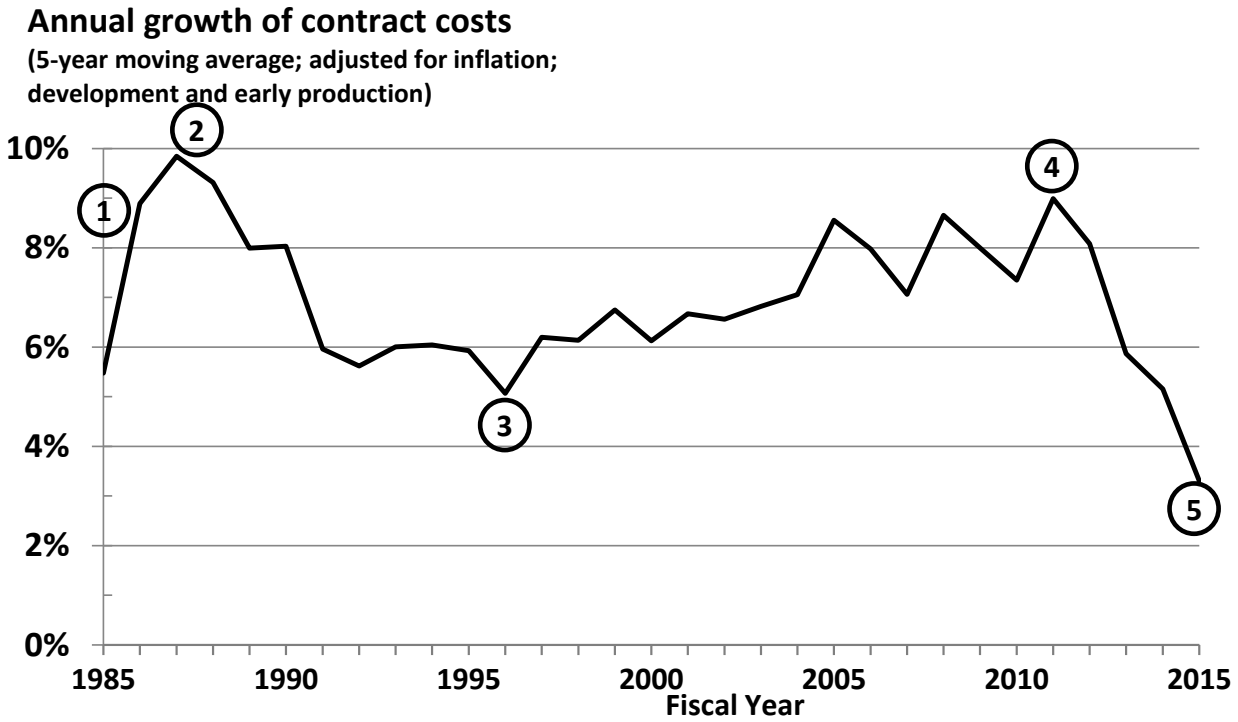
ANNUAL GROWTH OF CONTRACT COSTS FOR MAJOR PROGRAMS IN DEVELOPMENT AND EARLY PRODUCTION

Are there periods of improved cost control on defense contracts? Have recent efforts produced measurable results? What effects have external events and major policy changes had on controlling costs on major defense programs?

To help answer these questions, we examined the 5-year moving average of annual growth in total EV contract costs on major contracts[30] for the development and early production of MDAPs. Growth is in real terms (i.e., after adjusting for inflation). This different measure of growth reflects changes relative to negotiated cost targets on contracts tracked in EV reports. It includes both scope growth (i.e., work added to a contract after award) and overruns (i.e., latest estimate of cost over the latest negotiated target). Negotiated targets do not necessarily equal Government or contractor negotiation cost estimates. These contract level targets are also different than broader program-level cost estimates, baselines, and statutory measures of cost growth relative to program-level baselines, because it excludes noncontracted costs and the majority of production contracts. Nonetheless, we expect that the cost-reimbursement and fixed-price incentive contracts that this study examines should show the same trends as other measures of total program cost growth—in part because production contracts have much lower cost growth than these development and early production contracts. EV reports are typically limited to development (engineering and manufacturing phase) and early production contracts. They include fixed-price incentive and cost-reimbursement contracts but generally not firm-fixed-price contracts (which often are not appropriate until full-rate production and usually do not report EV). Each year's growth is the sum of all the changes in active contract values divided by the sum of all the original target costs. Thus, the portfolio percentage change will be closer in value to the percentage change of the larger contracts. Of final note, reports of scope changes and estimates of final cost in EV reports can be sporadic, leading to wide year-to-year changes; therefore, we used a 5-year moving average to smooth out these effects and reveal longer-term trends.

We used standard statistical modeling techniques to identify statistically significant factors that are likely causes of growth. For example, are reductions merely reflections of budgetary

[30] Major contracts include the six largest contracts (prime, associated, or for government-furnished equipment) for each MDAP valued at more than $40 million. Earned value data also are available for other MDAP contracts of at least $60 million in RDT&E or $250 million in procurement or ship construction (in FY 1990 constant dollars). Note that EV data are usually not provided for firm-fixed-price contracts, so this MDAP contract dataset has very few such contracts.



544 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

reductions, or are there measurable structural shifts from major policy changes? Is the defense system stable in dealing with external and internal spikes and shocks? Of course, proving causation is difficult, but correlation and coincidence combined with a deep understanding of defense acquisition can provide valuable insights into causes.

Annual Growth of Development and Early Production Contracted Costs

Figure 3-1 plots the 5-year moving average of annual growth in EV contracted costs on major contracts for MDAPs. It shows that BBP policy changes over the last several years appear to have produced dramatic downturns in the growth of costs on executing contracts for these programs.

Figure 3-1. Five-year Moving Average of Annual Growth of EV Contract Costs (FY 1985–2015)

NOTES: Numbered points are referenced in the discussion before the figure. The 5-year moving average of annual growth in contracted total costs is relative to *negotiated cost targets* on major contracts of MDAPs (including MAIS that are large enough to also be MDAPs) in EMD and early production that reported EV data (i.e., including almost no firm-fixed-price or full-production contracts). This is *different* than statutory measures of program-level cost growth measures such as PAUC and APUC relative to Milestone B baselines. These data summarize 18,470 earned-value reports on 1,123 major contracts for 239 MDAPs. TSPR = Total System Performance Responsibility.

The Goldwater-Nichols Act of 1986 (which reorganized the DoD), as well as the contemporaneous legislation that strengthened oversight of defense acquisition programs by the Office of the Secretary of Defense, coincided with a major downturn in annual growth of EV contract costs at point #2 on the chart. Also, the start of the recent BBP initiatives to instill cost consciousness, improve efficiency, strengthen the workforce, and seek ways to drive costs

545 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

downward coincided with the recent downturn starting at point #4. At 3.5% in FY 2015 for the portfolio, the DoD is now at the lowest level of growth since before FY 1985.

Conversely, policy changes that reduced oversight on contractor performance, starting in the mid-1990s, appear to coincide with an upturn in annual added costs on contracts from point #3. We test below whether that period increase is statistically significant (e.g., whether the trend is really flat from 1995 if you dismiss 1996 as anomalous).

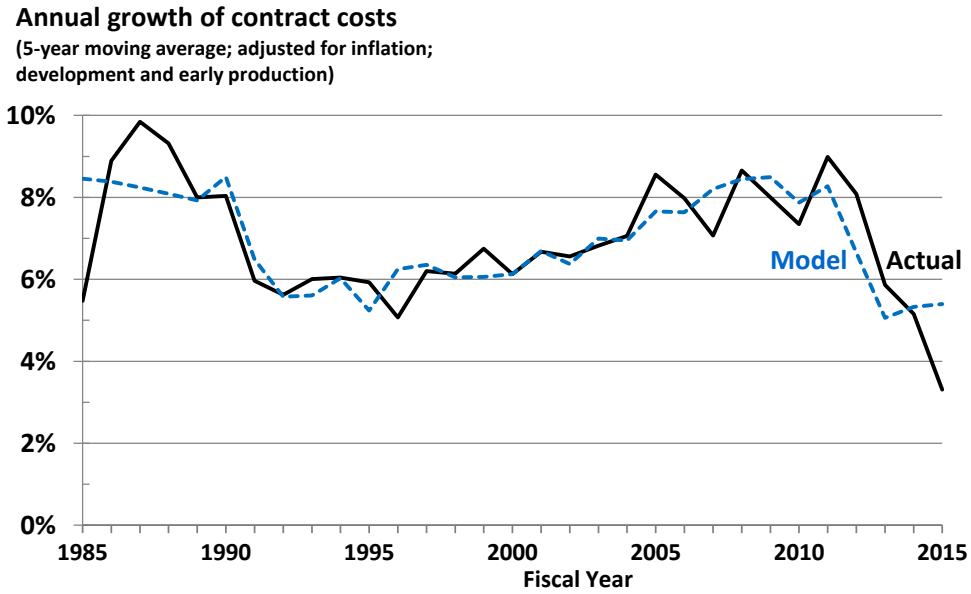
Increased demands for new capabilities can also add costs to contracts; that is visible in the chart during the defense buildup in the 1980s by President Reagan and during the post-9/11 wars to combat global terrorism.

Factors Contributing to Annual Growth in Contracted Costs

To understand whether the trends in Figure 3-1 are significant and what may be driving them, we employed the following statistical analyses. First, we wanted to determine whether the two steep drops are statistically significant or whether they are merely an artifact of budget cuts. We also wanted to test whether the growth in the mid-to-late 1990s was flat or significantly trending upward.

We found that the combined effects of three types of drivers—together with a constant base and random noise—very closely fit the dynamics of the growth curve.[31]

1) **Budget effects.** The growth in costs is, in part, positively correlated with budget levels and dynamics. This includes two factors:
   a) the average of the DoD budget over the past 5 years, and
   b) the change in that average from the prior year to the current year.
2) **Two structural changes.** Two overlapping periods correlate with partial reductions:
   a) one since 1990, coincident with post-Goldwater-Nichols implementation, and
   b) one since 2012, coincident with BBP implementation.[32]
3) **A self-correcting behavior.** A factor that corrects for prior differences between the anticipated cost growth from the budgetary, structural, and constant factors and the actual growth. This autoregression factor adjusts for unforeseen external "shocks" to the systems (including unanticipated changes in budgets) and internal variations (such as larger-than-modeled annual contract obligations). It serves as a kind of negative feedback that keeps the system under control.



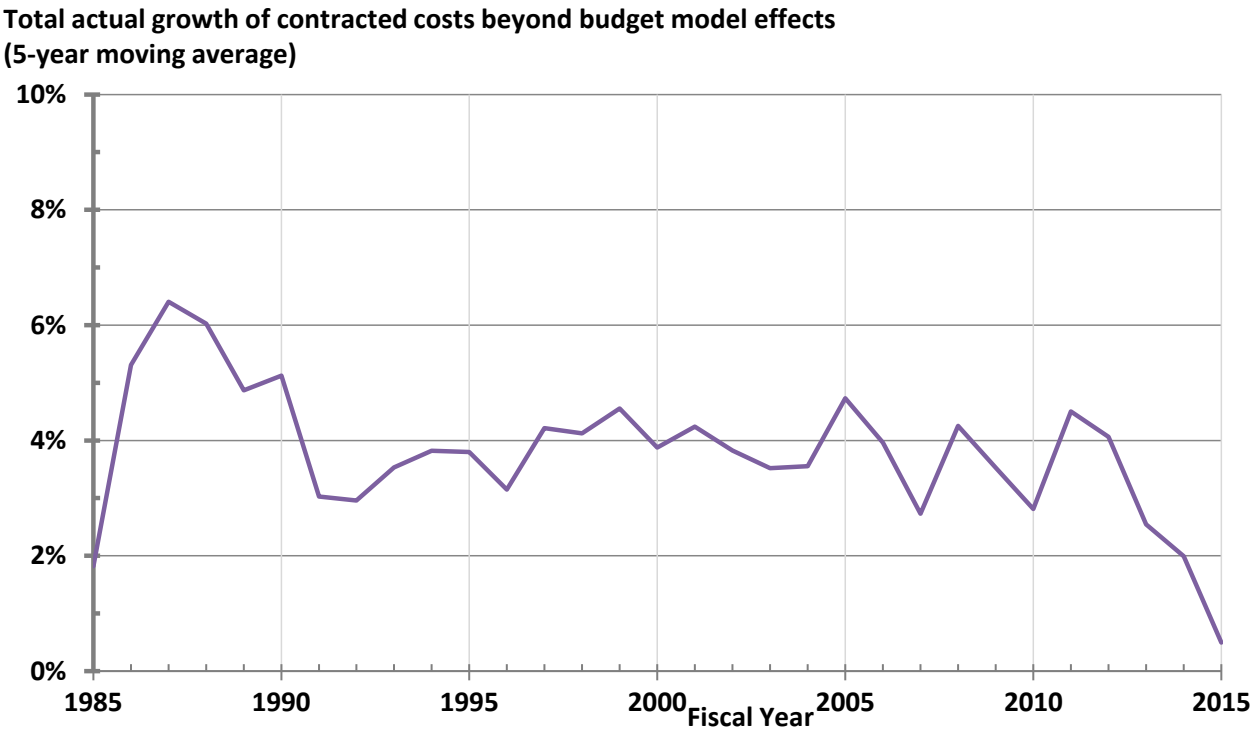
[31] The following variables were either spurious or statistically insignificant: UCAs (although UCAs can be significant in some commodity classes, especially ships in development); contract spending share of program spending; cost-over-target; share of cost growth due to work-content growth; share of cost growth due to cost-over-target; margin; change in margin over the contract's period of performance; contract size (total dollars); schedule growth; military department (i.e., Army, Navy, Air Force, or DoD); commodity type (except space systems in development and aircraft in early production); and quantity changes (USD(AT&L), 2015, pp. 75–77).

[32] Since the effects of new policies take time to show, we measured these periods to start 2 to 3 years after their enactment. Goldwater-Nichols Act was signed into law at the start of FY 1987, and the first BBP memoranda were issued in late FY 2010.

546 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

Figure 3-2 shows that the model closely fits the actual annual growth data. Further statistical details are presented in Appendix A.

Figure 3-2. Statistical Model Fit to Actual Growth of EV Contract Costs (FY 1985–2015)



NOTES: The 5-year moving average of annual growth in contracted total costs is relative to *negotiated cost targets* on major contracts of MDAPs (including MAIS that are large enough to also be MDAPs) in EMD and early production that reported EV data (i.e., including almost no firm-fixed-price or full-production contracts). This is *different* than statutory measures of program-level cost growth measures such as PAUC and APUC relative to Milestone B baselines. These data summarize 18,470 earned-value reports on 1,123 major contracts for 239 MDAPs.

Of note, we also tested for structural change during the period of the mid-to-late 1990s (FY 1995–2001) in the era of Reinventing Government. The effects in that era failed the statistical tests in these data (i.e., we cannot claim that they are statistically different from zero). Figure 3-3 shows that the growth during this period appears relatively flat after subtracting the partial budgetary effects.

547 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

Figure 3-3. Actual Growth Less Modeled Budget Effects (FY 1985–2015)

NOTES: The 5-year moving average of annual growth in contracted total costs is relative to *negotiated cost targets* on major contracts of MDAPs (including MAIS that are large enough to also be MDAPs) in EMD and early production that reported EV data (i.e., including almost no firm-fixed-price or full-production contracts). This is *different* than statutory measures of program-level cost growth measures such as PAUC and APUC relative to Milestone B baselines.

Testing for Underlying Causes

What may be the underlying causes for the factors identified above? While it is difficult to trace effects to individual policy changes, we can identify some underlying drivers and rule out others.

Development and Early Production Differences

BBP-era drops are driven by declining development cost-growth rates, not higher proportions of early production contracts. The recent downward trend is not driven by an increased fraction of early production dollars in the annual portfolios. Because growth on early production contracts has been lower than that for development since 1990, such a shift might have been a logical cause for the recent drop. In fact, however, the proportions between development and early production dollars have been relatively flat since 2012 (Figure 3-4). Instead, the overall BBP-era drop is being driven by steep drops in the growth rates on development contracts (Figure 3-5).

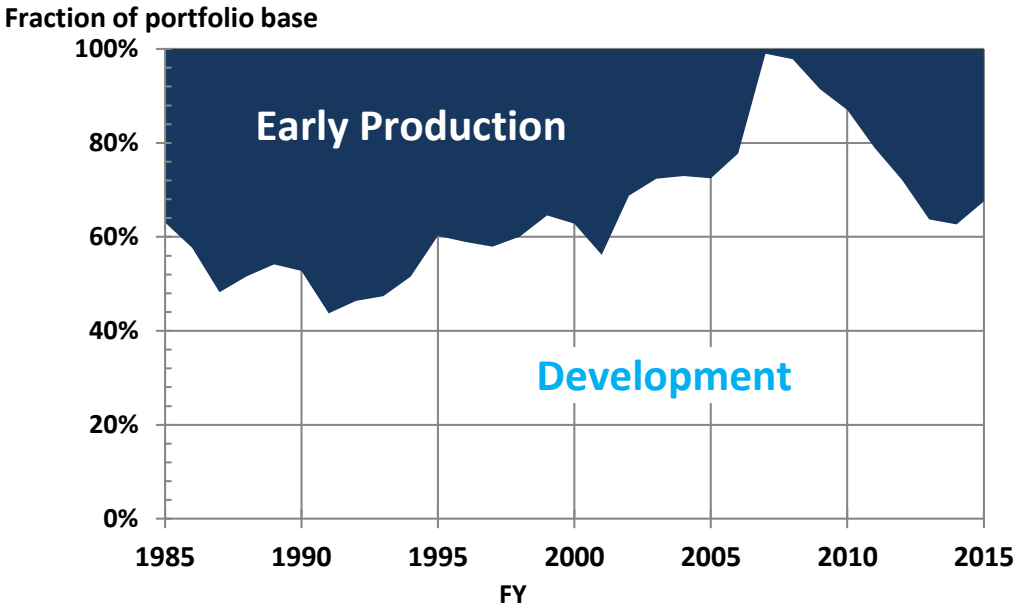
Initial Goldwater-Nichols-era drops are largely driven by declining early production cost-growth rates, not higher proportions of early production contracts. Similarly, the dramatic initial drop

548 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

from FY 1987–1991, as the Goldwater-Nichols-era changes were first being implemented, was driven mostly by steep drops in growth rates on early production contracts (Figure 3-5). The proportion of early production dollars in the portfolio was mostly flat in this early period. After this initial period, both the development cost rate and proportions were increasing, so the overall structural effect in the Goldwater-Nichols era is not due to the development/production split or their cost dynamics.

Schedule Effects

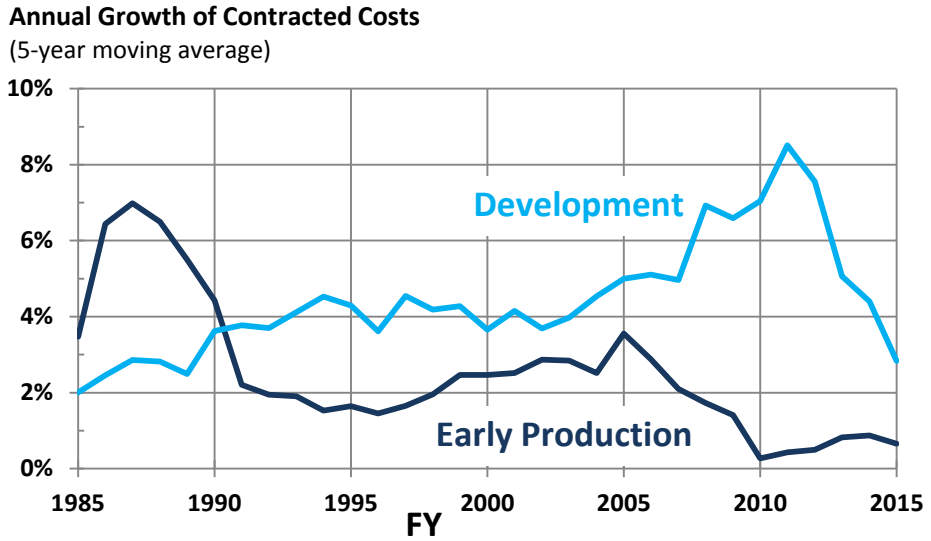
DoD generally was not adjusting schedule to lower costs. We were also able to reject the possibility that the DoD was simply adjusting contract schedules to lower growth of EV contract costs in the BBP era or overall. Overall, we found that the 5-year moving averages of growth in annual schedules and EV contract costs are statistically independent.[33] Moreover, our statistical model of schedule growth trends showed that it is a simple downward trend in time, along with a self-correction term and white noise (see p. 60). We can see this in Figure 3-6, where cost and schedule growth were moving in opposite directions since about 2002. We also note that in the BBP era (since 2012), schedule growth is essentially flat while cost growth has dropped dramatically.



Quantity Effects

These factors are independent of quantity changes. Lastly, we note that prior research showed that contract quantity almost never changes on these early production contracts—at least since about the year 2000 (USD(AT&L), 2015b). Also, quantity generally is not an element on development contracts (except for relatively few test articles). Therefore, quantity is not an underlying cause for the factors in the statistical model or for the separate growth dynamics by development and early production.

[33] I.e., they failed the Spearman correlation test.



549 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

Figure 3-4. Portfolio Split Between Development and Early Production Contracts

NOTE: This reflects the relative total dollars in the contract bases each year.

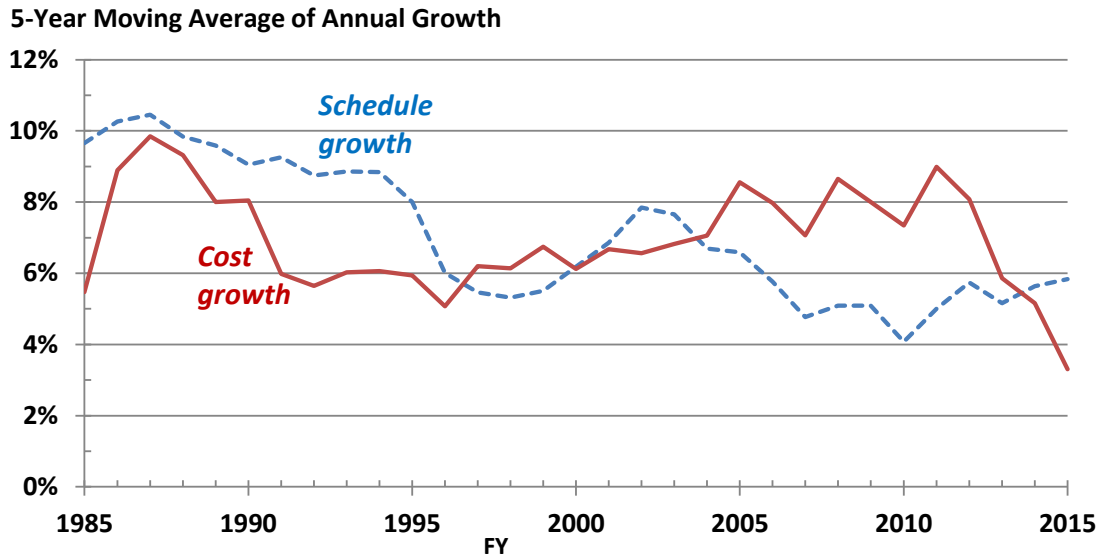


Figure 3-5. Separate Growth Rates for Development and Early Production Contracts

NOTES: The 5-year moving average of annual growth in contracted total costs is relative to *negotiated cost targets* on major contracts of MDAPs (including MAIS that are large enough to also be MDAPs) in EMD and early production that reported EV data (i.e., including almost no firm-fixed-price or full-production contracts). This is *different* than statutory measures of program-level cost growth measures such as PAUC and APUC relative to Milestone B baselines. These data summarize 18,470 earned-value reports on 1,123 major contracts for 239 MDAPs.

550 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

Figure 3-6. Comparing Growth in Schedule and Cost on Major Contracts (FY 1985–2015)

NOTE: Spearman's correlation test showed that schedule growth and cost growth are independent (not correlated) over this period. In the BBP era (since 2012), schedule growth is essentially flat, while cost growth has dropped dramatically.

Cycle Time, Scope Growth, and Commodity Effects

Cycle time, scope growth, and certain commodities correlate with growth of costs in these data. Prior research did find three variables that generally correlate with growth in this type of contract data: the original length of the contract (i.e., cycle time, not schedule growth), scope growth, and two commodities (space systems in development and aircraft contracts in early production). Cycle time was the largest correlate (USD(AT&L), 2015b, pp. 75–77).

Contract Incentives and Should-Cost

Reduced cost growth in the BBP era may correlate with the requirement to identify and pursue Should-Cost savings and a renewed effort to improve contract incentives. The DoD has continued to see increasing savings on programs from Should-Cost initiatives in BBP. These savings have grown across the acquisition portfolio, so these may have additional effects in lowering scope growth and cycle time at the contract level. We have also seen recent shifts in contract types used for development and early production toward those types that data show are more effective at cost control.

Contract Baselining Effects

Analogous to our discussion of baselining effects on program-level cost growth, these reductions in the growth of contract cost may be due to systematic shifts in the contract cost baselines (targets) against which we measure growth.[34] These contract baselines either are cost

[34] Like voltage, cost growth must be measured against some reference point.

551 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

targets negotiated with the contractor (especially on complex systems, which dominate MDAP acquisitions) or directly reflect initial bid prices. Thus, any systematic shifts in target baselining could reflect a number of factors, including better historical data for Government cost estimating; changes in cost and pricing data provided from bidders to the Government; more realistic assumptions made by the Government or contractor; changes in risk taking and optimism by the Government or contractors; and shifts in contractor bidding and negotiation strategies. However, while the DoD has worked in recent years to improve cost estimating, negotiations, and contract structures, those efforts date back to 2008 and earlier, whereas the drop in growth of contracted costs is evident after 2011.

Program Management

Another possible driver of recent improvements could be better program management (e.g., better configuration control and more active monitoring and engagement of contractor performance, requirements, and cost drivers). Better EV data and increases in the acquisition workforce are enablers.

Other Variables

Prior research statistically tested a number of other variables that do not correlate strongly with growth of costs on these contracts. Further, prior research tested a number of other variables for correlation with price and cost growth on these contracts since the year 2000 (recall footnote 31).

Discussion

The procyclical nature of annual growth of contracted costs may be, in part, because a higher annual planning budget allows PMs the freedom to add or complete work to address design and engineering problems and evolving threats, including higher risk tasks and more efficient approaches that save money in the long run. Conversely, a lower annual planning budget would constrain PM flexibility, increasing prioritization, constrain capabilities, and defer higher risk tasks and those with high long-term payoff but short-term costs.

This analysis provides some insights into the behavior of the defense acquisition system.

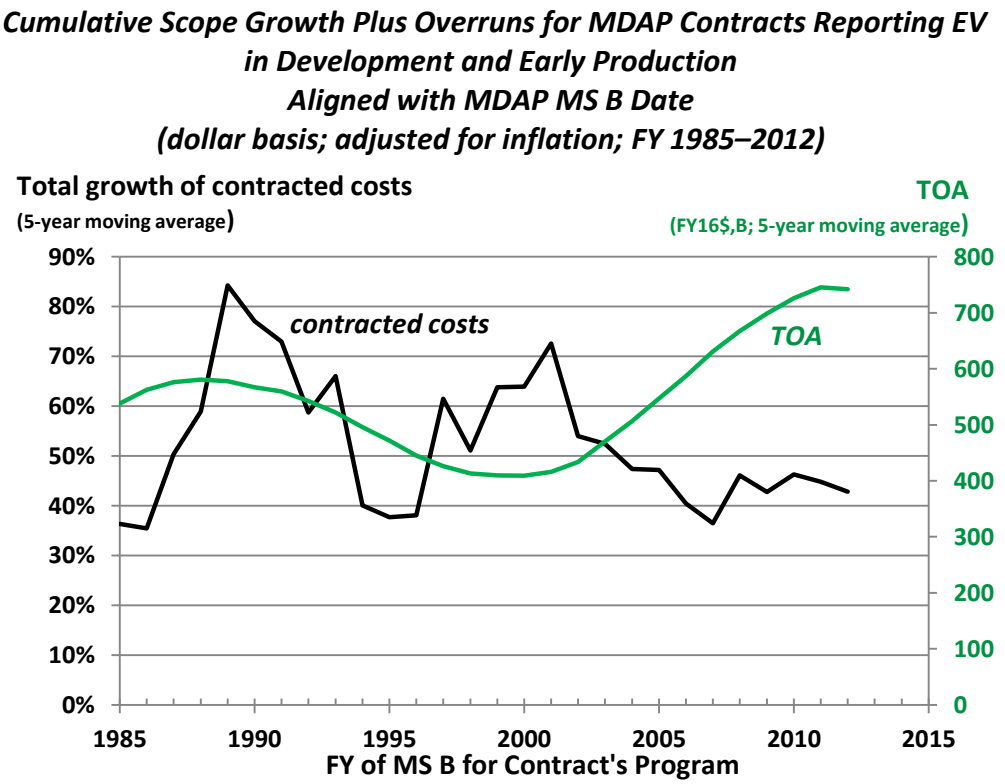
- The autoregression feedback indicates a self-correcting control system.
- It adjusts to budgetary changes, prior differences from expectations, and unforeseen external shocks.
- Added oversight from Goldwater-Nichols-era changes appears to have had a major effect at moderating contract cost behavior. Similarly, recent efforts to instill a cost-conscious culture have improved cost control. The reforms of the mid-1990s coincided with an undesirable trend, though unlike the positive trends, our modeling did not show statistically significant indications of causal factors.

Taken together, this analysis provides both an encouraging and cautionary tale that some reforms have moderated costs in this metric while others have not. It also demonstrates how statistical analysis, combined with theoretical insights, offers useful information on the effects

552 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

of policy changes and thus can inform future decision making without repeating past mistakes or resorting to speculation, intuition, or change for the sake of change.

BUDGET CLIMATE EFFECTS ON TOTAL GROWTH OF CONTRACT COSTS



In addition to annual growth of contracted costs (above), we tested for correlates in the same contract EV date for development and early production when all costs are attributed to the MS B date of the program that the contracts are for. This is the contract-level analysis analogous to the program-level studies by McNicol and Wu (2014) cited in last year's report, which examined the effects of budgetary climates on PAUC growth from 1970 to 2007; they found that constrained budgetary climates during program baselining correlate with significantly higher PAUC growth.

Total Growth of MDAP Contracted Costs in Development and Early Production Aligned to MS B Date

Figure 3-7 plots the 5-year moving average of total growth on MDAP contracted costs aligned to MS B date. For comparison, the 5-year moving average of DoD's annual Total Obligation Authority (TOA) is overlaid in green to help visualize budgetary swings during the same period. Again, a moving average was used to help smooth the data and reveal evolving trends. Remember that these data reflect both work-content (i.e., scope) growth (which generally dominates such cost growth on EV-reporting contracts—see our prior annual reports) and cost-over-target (i.e., overruns relative to the contract target).

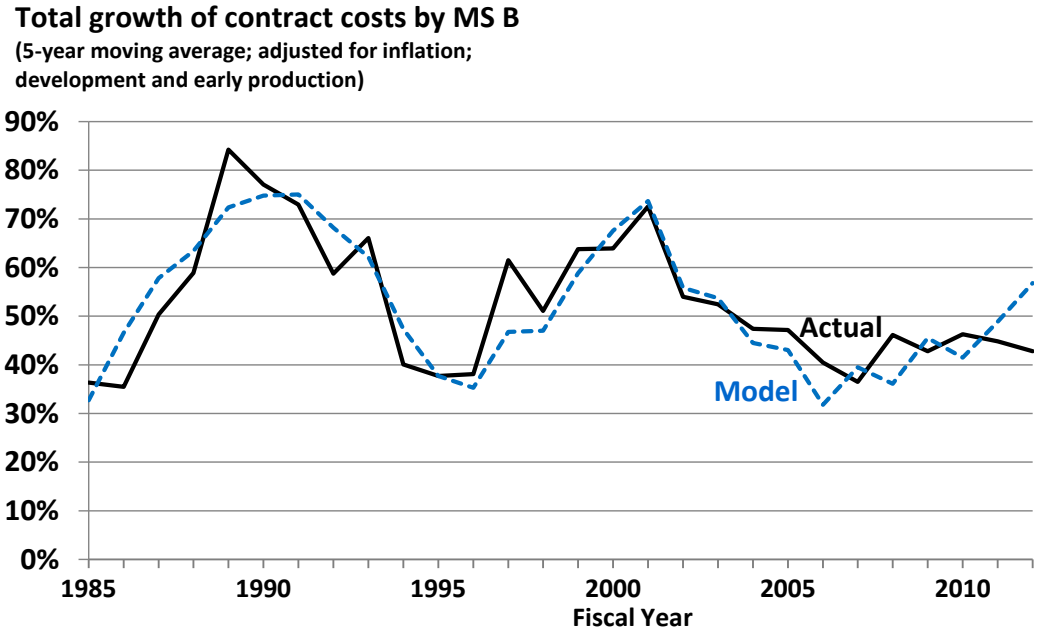
553 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

Figure 3-7. Five-year Moving Average of Total Growth of Contracted Costs for MDAPs Aligned to Milestone B date (FY 1985–2012)

NOTES: Total growth of contracted costs is aligned to the original MS B date regardless of contract start dates. DoD TOA is shown in green, and its scale is on the right-hand y-axis in FY 2016 real dollars. The 5-year moving average of total growth in contracted costs is relative to negotiated cost targets on major contracts of MDAPs (including MAIS that are large enough to also be MDAPs) in EMD and early production that reported EV data (i.e., including almost no firm-fixed-price or full-production contracts). This is *different* than statutory measures of program-level cost growth measures such as PAUC and APUC relative to Milestone B baselines. These data summarize 18,470 earned-value reports on 1,123 major contracts for 239 MDAPs.

Factors Contributing to Total Growth in Contracted Costs at Program MS B Start

To understand what may be driving the trends in Figure 3-7, we tested for statistical correlation of different available variables against the total growth curve. We found that the combined effects of two types of drivers—together with a constant base and random noise—very closely fit the dynamics of the growth curve.



1) **Countercyclical budget effect.** The total growth in costs aligned to MDAP start is, in part, countercyclical with the change in the 5-year moving average of the TOA from the prior year.
2) **Three self-correcting factors.** The data behave as if the system corrects for prior differences between the anticipated growth levels from the countercyclical budget factor and the actual growth (with three different lags of 1, 4, and 5 years) due to "shocks" to the system. In other words, it appears that the system not only responds countercyclically to budgetary changes but also sees and responds to cost growth on programs started in the recent past relative to that countercyclical behavior.

554 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

Figure 3-8 shows that the model closely fits the data for the actual total growth by MS B date. Further statistical details are presented in Appendix C.

There were no statistically significant structural changes in this period for this performance measure. Since the contract data are aligned to MS B dates, the plot extends only to 2012, so it is too early to tell if recent efforts such as BBP and management discipline during the current sequestration downturn in budgets will moderate the historical countercyclical behavior. There are early indicators that this may be happening, however, in the last few years of data where the model departs from actual results.

Figure 3-8. Statistical Model Fit to Actual Growth of Total MDAP Contract Costs by MS B (FY 1985–2012)

Discussion

The countercyclical nature of total growth of MDAP contracted costs by MS B start date seems to imply that, in tight budgetary environments, resource planners may be willing to take risks to maintain program start rates and may use overly optimistic initial cost estimates to fit budgets. Since initial estimates are optimistic and risks are high, we can expect higher cost growth.

Conversely, in accommodating budgetary environments, there is less pressure to assume risk to maintain the number of program starts, so DoD Components may have more realistic program start rates and cost estimates. Since initial estimates are realistic and risks are low, we historically saw lower cost growth. Industry may reinforce these tendencies by taking more risk and bidding low to win the only available program opportunities.

These data (along with results from McNicol and Wu, 2014) support caution about the tendency to start programs with overly optimistic program-cost baselines and contract cost targets in times like the present.

555 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

SUSTAINMENT COSTS

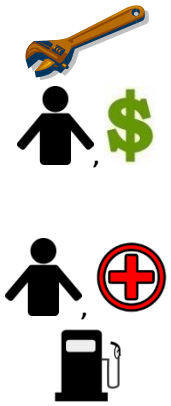
While much attention and data focus on the efficient development and procurement of defense systems, O&S costs can outweigh earlier acquisition costs. As a result, we are expanding our analyses to provide insights on how effective the acquisition system is at understanding and controlling total life-cycle costs. This includes understanding the major drivers of O&S cost growth and (in part) our ongoing affordability policy and process.

Correlates of Growth in O&S Cost Estimates During Acquisition

We examined 161 MDAPs that provide O&S cost estimates in their SARs. After adjusting for inflation using the Comptroller's O&M deflator (USD(C), 2016c), we tested a range of variables for correlation with the changes over time in O&S cost estimates during acquisition.

DoD-Wide

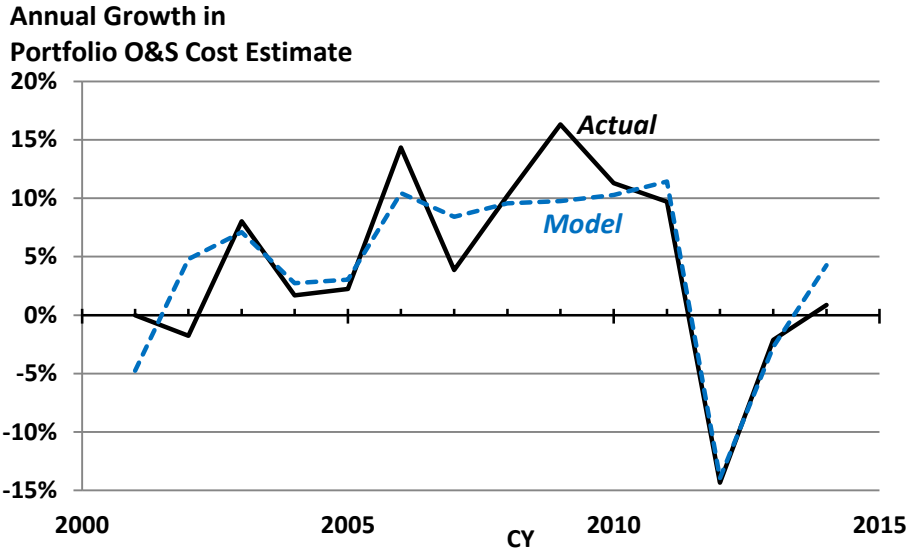
Table 3-1 summarizes the variables that correlate with DoD-wide growth of O&S cost estimates on MDAPs during acquisition. Across the DoD during CY 2001–2014, inflation-adjusted maintenance, labor, and fuel costs correlated with changes in O&S cost estimates. Specifically, O&S cost estimates generally increase with maintenance cost growth, wages (both absolute levels and growth), and health-care cost growth. Also, cost estimates tend to change based on fuel price levels, but interestingly the model predicts that estimates will decrease when fuel prices increase. We suspect that this negative correlation may reflect program actions to improve system fuel efficiency (if changes can be made early enough to affect consumption) or program-manager expectations that operational tempo or concepts of operations would be adjusted if prices remain high.[35] Note that all but the maintenance cost growth factor has an associated time lag of 2–5 years. This model fits very closely with the actual growth in O&S cost estimates reported in the SARs (Figure 3-9). The model explains 81 percent of the variation in annual change in O&S cost estimates.



Interestingly, O&S cost-estimate changes from CY 2001–2014 did not correlate DoD-wide with growth in any of fuel-price, quantity, or service-life.[36] As we will see shortly, however, these did correlate with DoD Component and commodity O&S cost estimates in some cases.

[35] As with all estimates, there is no guarantee that actual operational changes would be made in the future, but operational tempo and concept-of-operations are levers often employed to modulate O&S expenses.

[36] Service life is the expected length of time that the system will be in operation.



556 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

Table 3-1. Correlates of O&S Cost-Estimate Growth: DoD Wide (CY 2001–2014)

Sign	Cost Variable	Metric	Lag
+ *Increased with*	**Maintenance**	growth (annual)	—
+ *Increased with*	**Wage**	levels	2 years prior
+ *Increased with*	**Wage**	growth (annual)	3 years prior
+ *Increased with*	**Health care**	growth (annual)	5 years prior
– *Decreased with*	**Fuel price**	level	5 years prior

Figure 3-9. Model Fit: Annual Change in Portfolio O&S Cost Estimates: DoD-Wide (CY 2001–2014)

NOTE: *N* = 161 MDAPs. *R*-squared = 81%. *p* = 0.0000.

557 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

Table 3-2 illustrates the model and the relative magnitude of the individual partial contributions from the variables by inserting the actual values for the variables in CY 2014. The largest partial contributor for CY 2014 was from wages, followed by health care and fuel. Remember that in such models all factors must be added together to obtain the total model prediction.

Table 3-2. Example: Modeled cost growth in DoD-wide MDAP O&S estimate for CY 2014

	Variable	CY 2014 Value	Coefficient	Partial Contribution
Maintenance	Annual change in portfolio maintenance cost estimate	4.6%	0.09133	0.4%
Wages	Average annual wage per worker above $43.5K *(real; 2 years prior; $1,000s)*	$1.03K	5.91% / $K	6.1%
	Annual change in annual median wage per worker *(real; 3 years prior)*	−0.31%	2.27	-0.7%
Heath care	Annual change in per capita health consumption *(real; 5 years prior)*	2.15%	2.64	5.7%
Fuel	Annual average price per barrel of crude *(real; 5 years prior)*	$63.35	−0.0891% / $	-5.7%
Partial constant			-1.5%	-1.5%
				Total 4.3%

NOTE: Partial contributions are the result of multiplying the 2014 value by the coefficient for the variable. The total is then the sum of all the partial contributions plus the constant. To simplify the example, we used the wage level of $43.5K (the average across 2001–2014) as the base level for the variable, adjusting the constant accordingly.

In summary, while PMs cannot control the exogenous forces of wages, health-care costs, and fuel prices, the PM has some ability to affect fuel efficiency and maintenance costs (e.g., system reliability, ease of maintenance, and repair automation). However, many of these levers must be addressed very early in the design of the system. That is why the DoD's new affordability process sets goals and caps on life-cycle costs early in the program's life (e.g., at MDD and MS A, when designs can be changed).

This analysis also illustrates to stakeholders in the DoD and in Congress that annual swings in SAR O&S cost estimates can only partially reflect the performance of the defense acquisition system. Also, the way that O&S metrics are constructed makes it very hard to separate acquisition program effects from external effects. Improvements would require additional metrics that hold the external variables constant from MS B forward (for purposes of comparison) so as to reveal changes due to factors that the acquisition system can control.

558 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

By Military Department

Table 3-3 summarizes the variables that correlate with growth of MDAP O&S cost estimates by military department. Many of the correlated variables for the DoD Components resembled the DoD-wide results, but there were differences, including different lag periods. Also, while DoD-wide cost-estimate changes did not correlate with fuel-price growth, the Air Force and Other DoD estimates did (and they were positively correlated). Service-life growth was correlated with Army estimates during this time period. The fact that fuel costs are positively correlated for the Air Force and Navy may indicate that they have less ability to adjust estimated operational tempo or fuel efficiency within the system designs. Note that all but the maintenance cost growth factor has an associated time lag.

Table 3-3. Correlates of O&S Cost-Estimate Growth by DoD Component (CY 2001–2014)

Variables	*Overall*	*By DoD Component*			
	DoD-wide (lag, years)	Army (lag, years)	Navy (lag, years)	Air Force (lag, years)	Other DoD (lag, years)
Maintenance cost growth*	+	+	+		
Wage	+ (2)				+ (2)
Wage growth*	+ (3)		+ (3)	+ (3)	
Health-care cost growth*	+ (5)	+ (4)			
Fuel price	− (5)	− (5)	+ (3)	+ (2)	− (5)
Fuel-price growth*				+ (5)	+ (1)
Service-life growth*		+			

* annual (year-on-year) change
\+ positively correlated
− negatively correlated
NOTE: Growths are annual from prior year. DoD-wide results are included to facilitate comparisons. Blank entries indicate no correlation. For the Army, the model explained 85% of the variation and is statistically significant at the 1% level of significance (p = 0.0002). For the Department of the Navy, the model explained 77% of the variation and is statistically significant at the 1% level of significance (p = 0.0023). For the Air Force, the model explained 61% of the variation and is statistically significant at the 5% level of significance (p = 0.0190). For other DoD systems, the model explained 47% of the variation and is statistically significant at the 1% level of significance (p = 0.0083).

By Commodity

Finally, Table 3-4 summarizes the variables that correlate with growth of MDAP O&S cost estimates by four commodities: fixed-wing aircraft, helicopters, ships, and space. As with the DoD Components, many of the correlated variables for the commodities resembled the DoD-wide results, but there were differences, including different lag periods. While DoD-wide cost-estimate changes did not correlate with fuel-price growth, it did for ship estimates (and the correlation was positive, which indicates that ships tend to be less flexible in steaming hours[37]

[37] Steaming hours reflect ship operation, including hours underway and not underway (in port).

559 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

and supports the Navy model above). Also, quantity growth was correlated with aircraft and space O&S estimates during this time period. Note that all but the maintenance cost growth factor has an associated time lag.

Table 3-4. Correlates of O&S Cost-Estimate Growth by Commodity (CY 2001–2014)

Variables	*Overall*	*By Commodity*			
	DoD-wide (lag, years)	Aircraft, fixed-wing (lag, years)	Helo (lag, years)	Ships (lag, years)	Space (lag, years)
Maintenance cost growth*	+			+	
Wage	+ (2)				
Wage growth*	+ (3)	+ (3)	+ (2)	+ (3)	
Health-care cost growth*	+ (5)		+ (3)		
Fuel price	− (5)	+			+ (3)
Fuel-price growth*				+ (3)	
Quantity growth		+			+

* annual (year-on-year) change
\+ positively correlated
− negatively correlated
NOTE: Growths are annual from prior year. DoD-wide results are included to facilitate comparisons. Blank entries indicate no correlation. For fixed-wing aircraft, the model explained 55% of the variation and is statistically significant at the 5% level of significance (p = 0.0229). For helicopters, the model explained 53% of the variation and is statistically significant at the 1% level of significance (p = 0.0044). For ships, the model explained 71% of the variation and is statistically significant at the 10% level of significance (p = 0.0564). For space systems, the model explained 64% of the variation and is statistically significant at the 1% level of significance (p = 0.0001). For space systems, the correlation with fuel prices may seem odd, except that most O&S costs are for ground operations, not the actual operation of the spacecraft in space.

AFFORDABILITY

BBP established an explicit policy and process codified in DoDI 5000.02 (USD(AT&L), 2015a) for determining and ensuring the long-term affordability of the entire life-cycle costs of each system to be acquired. Affordability analysis and constraints impose procurement and sustainment budget controls on the system throughout the FYDP and beyond. Constraints are determined in a top-down manner by the resources a DoD Component can allocate for a system, given inventory objectives and all other fiscal demands on the DoD Component against a long-term future total budget projection. Constraints (especially the caps established at the Development Request for Proposals Release Decision Point before MS B) constitute a threshold for procurement and sustainment costs that cannot be exceeded by the PM. When affordability constraints cannot be met—even with aggressive cost control and reduction approaches—then technical requirements, schedule, and required quantities must be revisited (e.g., with support from the DoD Component's Configuration

560 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

Steering Board). The program will be canceled if constraints still cannot be met, and the DoD Component cannot offset cost increases by lowering the caps on other programs.[38]

It is too early to test the effect of the affordability process on outcomes from the acquisition system (e.g., whether program cancellations are made earlier and thus reduce sunk costs), but we have begun to measure the degree to which the affordability analysis and constraints have been implemented in the DoD. All three military departments have established an affordability analysis capability, centered in their staff directorates for financial management and resource planning (i.e., G-8, N-8, and A-8 for the departments of the Army, Navy, and Air Force, respectively) in support of Service leadership decision making.

Affordability constraints have been imposed on 31 of 45 MDAPs that have undergone major reviews between November 2010 and July 2016, including those that have not yet passed MS B. Thus, about two-thirds of MDAPs have been assigned an affordability constraint commensurate with the policy in place at the time of their reviews. The implementation rate for MAIS is improving but is still much lower at about 44 percent (4 of 9 programs). The DoD is working to improve consistency in application of the affordability policy to both MDAPs and MAIS.

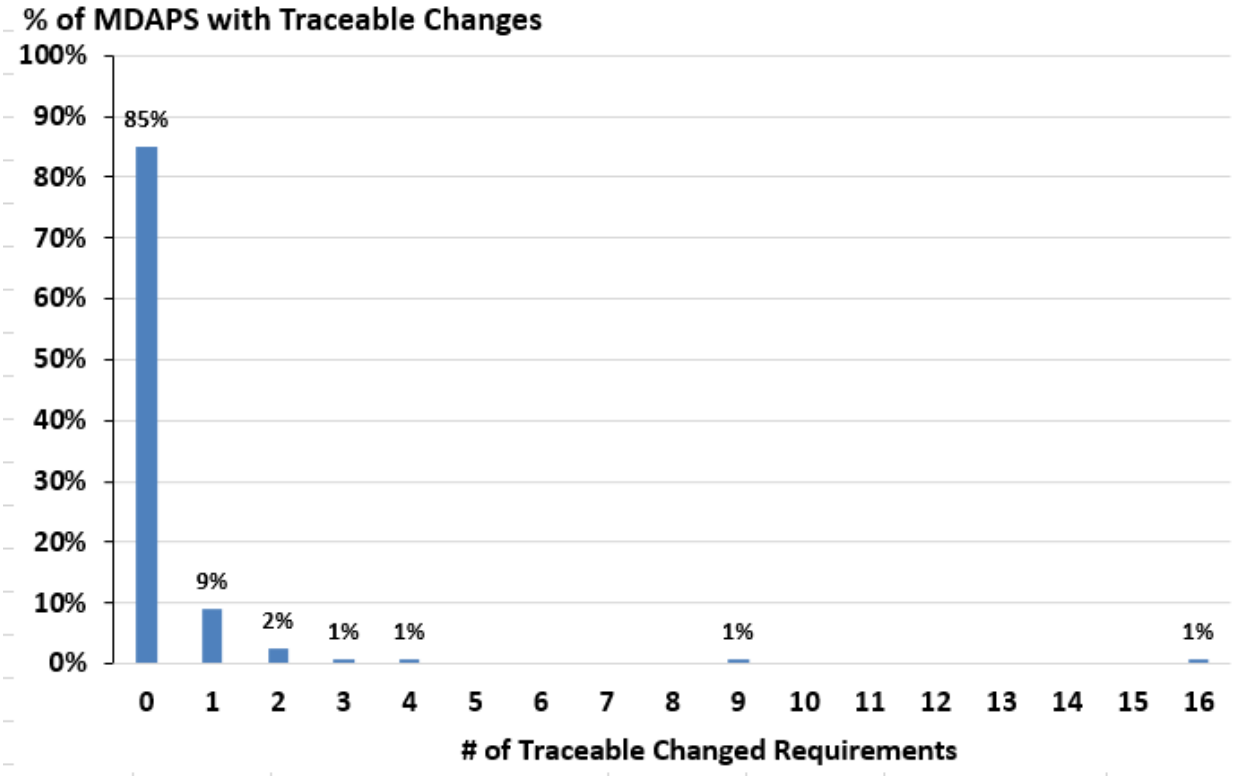
In addition, we track affordability constraints and compare program performance against those constraints on a regular basis. We are reviewing these programs and refining how best to handle each individual case given needs and budgetary constraints.

DYNAMICS OF PROGRAM PERFORMANCE REQUIREMENTS: PRELIMINARY ANALYSIS

One potential source of program cost or schedule growth is program requirement changes. While casting requirements in stone would prevent the DoD from adapting to changes in threats, engineering challenges, and cost-benefit tradeoffs as engineering and operational insights are gained during development, we also do not want requirements to be highly dynamic, given the resulting implication for program cost and schedule. Generally, case studies (e.g., GAO, 2015b) and qualitative experience have shown that high-level requirements (KPPs and KSAs) tend to be changed infrequently while lower-level engineering requirements are adjusted more frequently as insights are learned from technology and engineering development.

To further test the consistency of these results, we compared the unclassified program "performance" requirements of the original MS B APB to the latest SAR for 121 MDAPs for which these data are readily available. These reported performance requirements are supposed to reflect the major unclassified KPPs, but they contain at least some KSAs. For this preliminary analysis, we counted traceable changes, additions, deletions, and specifications between these

[38] Independent of affordability constraints or cost estimates, the DoDI 5000.02 instructs PMs to always look for ways to control or reduce cost. The BBP Should-Cost initiative provides organizational incentives and rewards for Components and PMs to continue looking for cost reductions below the affordability constraints, while the Nunn-McCurdy breach process provides a strong organizational disincentive on excessive growth.



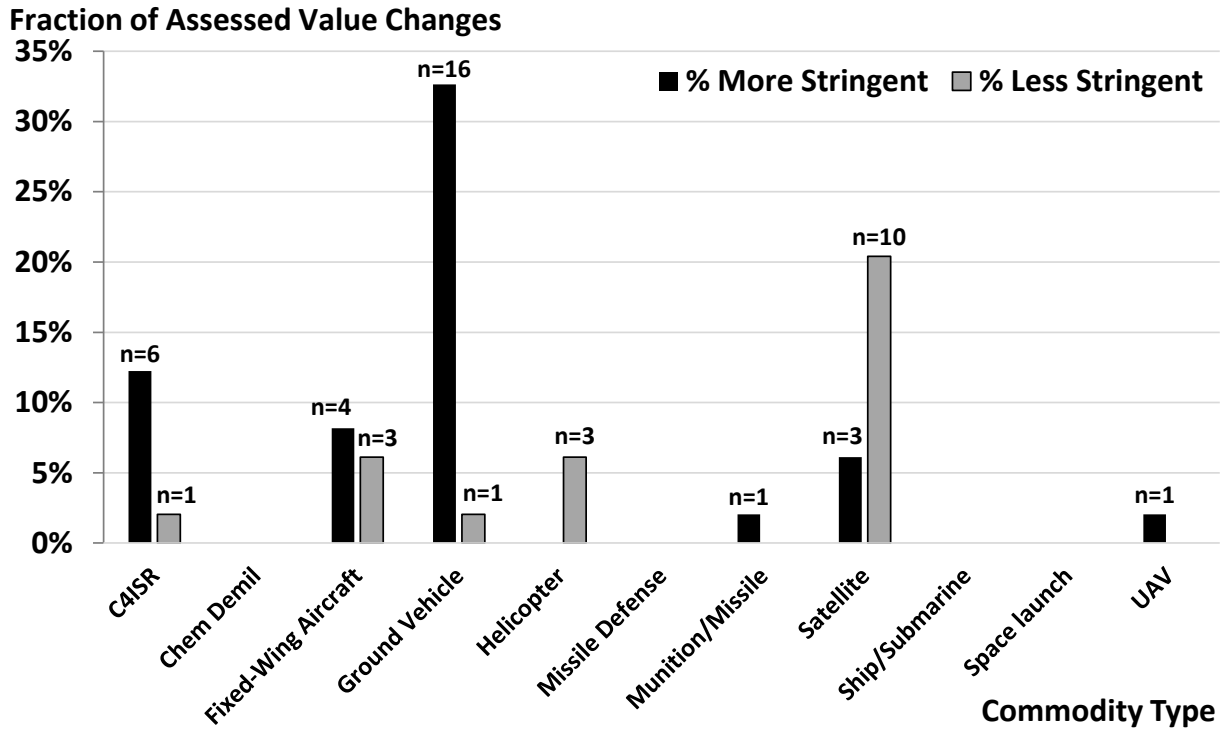
561 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

two documents. Here, specifications are the addition of a threshold value when none was present in the APB (e.g., were not marked or marked as "not specified"). Note that while the APB and SARs are official documents, they are not the authoritative source for program requirements and thus may differ somewhat for various reasons (e.g., data entry errors, omissions, or changes in selecting what to report). Also, it is important to note that these may not be contractual requirements, which have a direct effect on cost and schedule growth relative to contractor performance.

From this preliminary analysis we found that most MDAPs (about five-sixths of the 121 MDAPs in our dataset) did not make traceable changes (Figure 3-10). Most of the remaining MDAPs had very few traceable changes.

Further analysis is needed to determine the motivating factors for these changes (e.g., whether they were driven by changes in threats or to accommodate technical issues, or whether these changes were the result of reporting errors between the requirements documents and the APB and SAR documents). We also want to examine the source requirement documents to understand better which requirements were included in APB and SARs.

Figure 3-10. Fraction of MDAPs with Traceable Performance Requirement Changes Between MS B APB and Latest SAR (CY 1988–2015)



NOTE: This chart shows the percent of 121 MDAPS with traceable changes in performance threshold values between the original MS B APB and the latest SAR. APB dates ranged from CY 1988 to 2015. Corresponding SAR dates ranged from CY 2006 to 2015.

562 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

For the 49 cases in which we could judge whether a change was more or less stringent, Figure 3-11 shows the distribution by commodity type. Satellites, helicopters, and C4ISR systems tended to change requirements to make them easier to meet, while aircraft, ground vehicles, munition/missiles and UAVs all tended to increase the difficulty of meeting the requirement. Table 3-5 shows that, as with the overall change distribution, these changes tend to be concentrated in a small number of programs. Here about half of the requirements judged more stringent were in a single program (FMTV, a ground vehicle), and half of the less-stringent changes were in the NPOESS satellite program. Again, further analysis is needed.

Figure 3-11. Stringency of Performance Requirement Changes by Commodity Types (CY 1988–2015)

NOTE: *N* = 49 requirements changes that were rated as either more or less stringent. This chart shows the distribution of these 49 changes by commodity and stringency with the number of requirements listed above the bar.

563 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

Table 3-5. Programs with Changes Assessed as More or Less Stringent by Commodity Types (CY 1988–2015)

Commodity Type	Total # programs	# of Changes Judged: *More Stringent*	*Less Stringent*
C4ISR	*30*		
ATIRCM/CMWS		1	
JTN		1

		3	**10**
UAV	6		
RQ-4A/B Global Hawk		1	
		1	**0**
Chem Demil	3	**0**	**0**
Missile Defense	2	**0**	**0**
Ship/submarine	13	**0**	**0**
Space Launch	1	**0**	**0**
Total:	121	**31**	**18**

NOTE: About half of the more stringent changes are in FMTV, and half of the less-stringent changes are in NPOESS (see highlights in yellow). Program abbreviations are defined in Appendix F starting on p. 159.

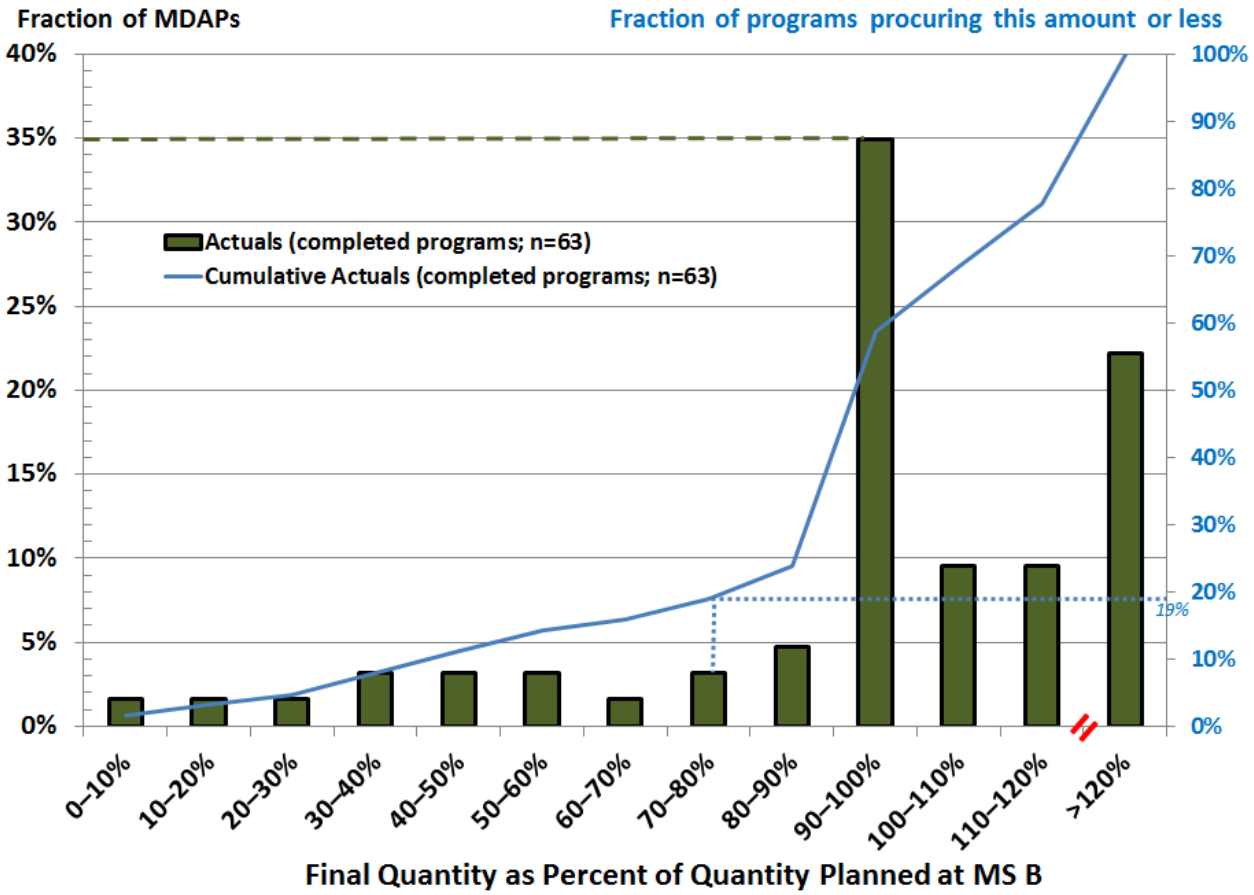
Further analysis is needed to determine the motivating factors for these traceable changes (e.g., whether they were driven by changes in threats or to accommodate technical issues, or whether these changes were the result of reporting errors between the requirements documents and the APB and SAR documents).

Finally, untraceable changes assessed as APB deletions, SAR additions, and specifications require further analysis to identify the details for why these untraceable changes were made.

564 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

QUANTITY PROCURED

Another useful measure of acquisition performance is the quantity of major weapon systems procured compared to the number planned at the original MS B. An oft-quoted saying by military strategists is that quantity has a quality all its own,[39] so it is useful to see how often the defense acquisition system ends up procuring the originally planned number of major weapon systems.



Despite reductions in quantity on some high-visibility programs (e.g., DDG-1000 and F-22), most programs deliver nearly the original quantity or more. Figure 3-12 shows the actual number of units procured by completed MDAPs that passed MS B over the past 19 years. Over 80 percent of programs delivered at least 80 percent of their originally planned units, and just over 40 percent of programs delivered more than originally planned.

This general pattern appears to be holding for currently active programs. Figure 3-13 shows the estimated final quantity distribution for active MDAPs along with the final quantity distribution for completed MDAPs. Again, most active programs estimate they will deliver at least 80% of their originally baselined quantities.

[39] The original source of this quote is difficult to verify.

565 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

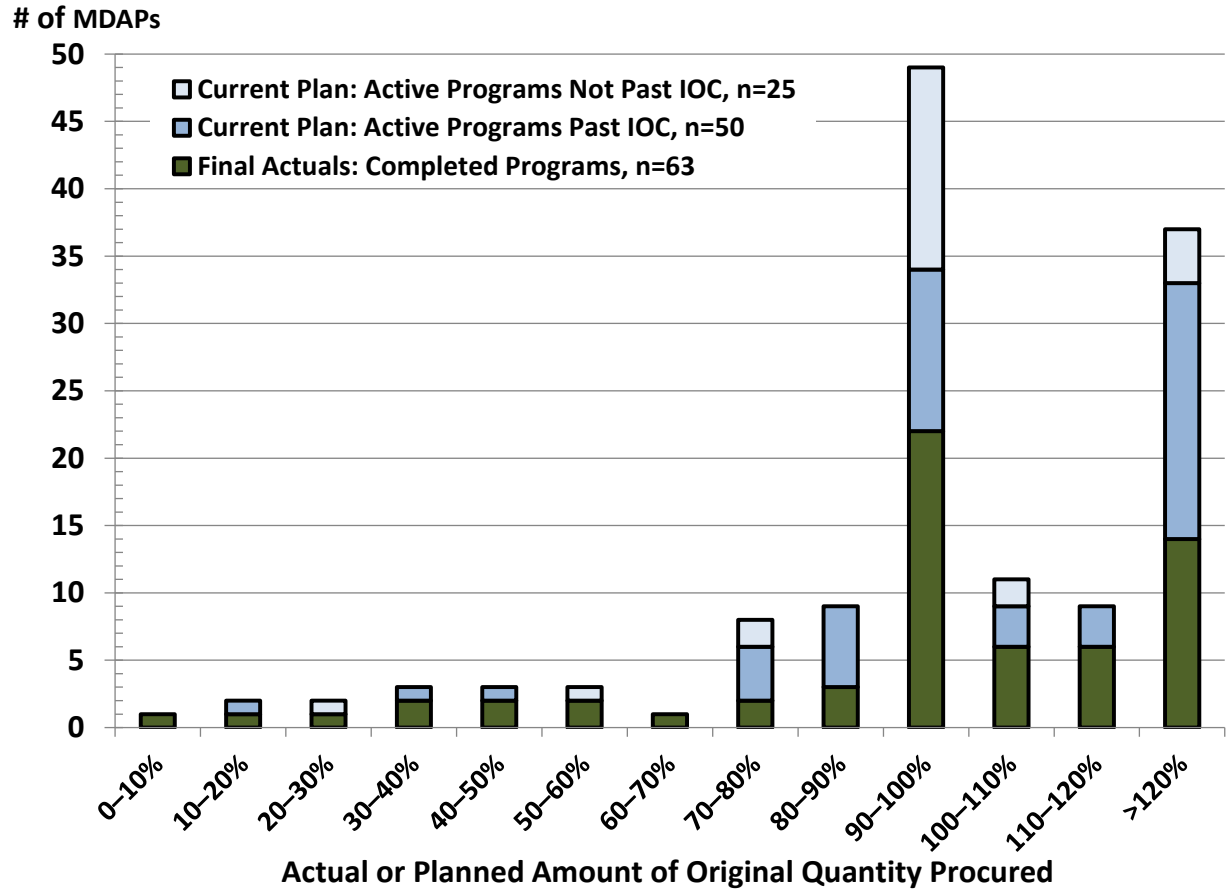


Figure 3-12. Actual Quantity Procured Compared to Original MS B Plans for Completed Programs (1997–2015 SARs)

NOTE: Completed programs are those that stop reporting after approximately 90 percent of units are delivered or 90 percent of funds expended. There were *N* = 63 completed programs in our dataset. The bars show the fraction of the 63 programs that procured the indicated range of original quantity percentages (e.g., 35 percent of the 63 programs procured 90–100% of their originally planned quantity). The blue line measures the cumulative fraction of programs and is read off the y-axis on the right side of the plot (e.g., 19 percent of the programs procured less than 80 percent of their originally baselined quantity).

566 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

Figure 3-13. Actual and Estimated Quantities Procured or Planned Compared to Original MS B Plans for Active and Completed MDAPs (1997–2015 SARs)

NOTE: Completed programs are those that stop reporting after approximately 90 percent of units are delivered or 90 percent of funds expended. The bars show the number of MDAPs that procured or plan to procure the indicated range of original quantity percentages. For example, 3 completed MDAPs procured 80–90 percent of their originally planned quantity while 6 active MDAPs that are past IOC also estimate to deliver 80–90 percent of their originally planned quantity.

PROGRAM CANCELLATIONS AND SUNK COSTS

We updated the data from our first report (USD(AT&L), 2013b) on the approximate sunk costs of MDAPs that were canceled past MS B. Here "canceled" is defined as being inactive and not achieving IOC. Table 3-6 lists the 23 programs that had at least one SAR in 1997–2015 and were canceled. Figure 3-14 plots the total sunk costs in two ways: first by the year of program initiation (MS B), and second by the year of cancellation. Using SARs only produces approximations for various reasons (e.g., final SARs are often not submitted; delayed budget requests in years when the presidential administration changes limit SAR data).

There were 136 MDAPs in these SARS that are either inactive or past IOC. Thus, the current cancellation rate for MDAPs that have passed MS B is about 17%, or one-sixth. The total sunk cost for these programs in FY 2017 dollars is $53.5 billion. Almost 44 percent of those dollars

567 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

are in two programs: Future Combat System (FCS; $20.7 billion) and the RAH-66 Comanche reconnaissance/attack helicopter ($9.8 billion). Eight canceled programs spent at least 100 percent of their original RDT&E baseline, including Comanche (but not FCS). On average, about two-thirds to three-fourths of the original RDT&E baselines were spent before these programs were canceled.

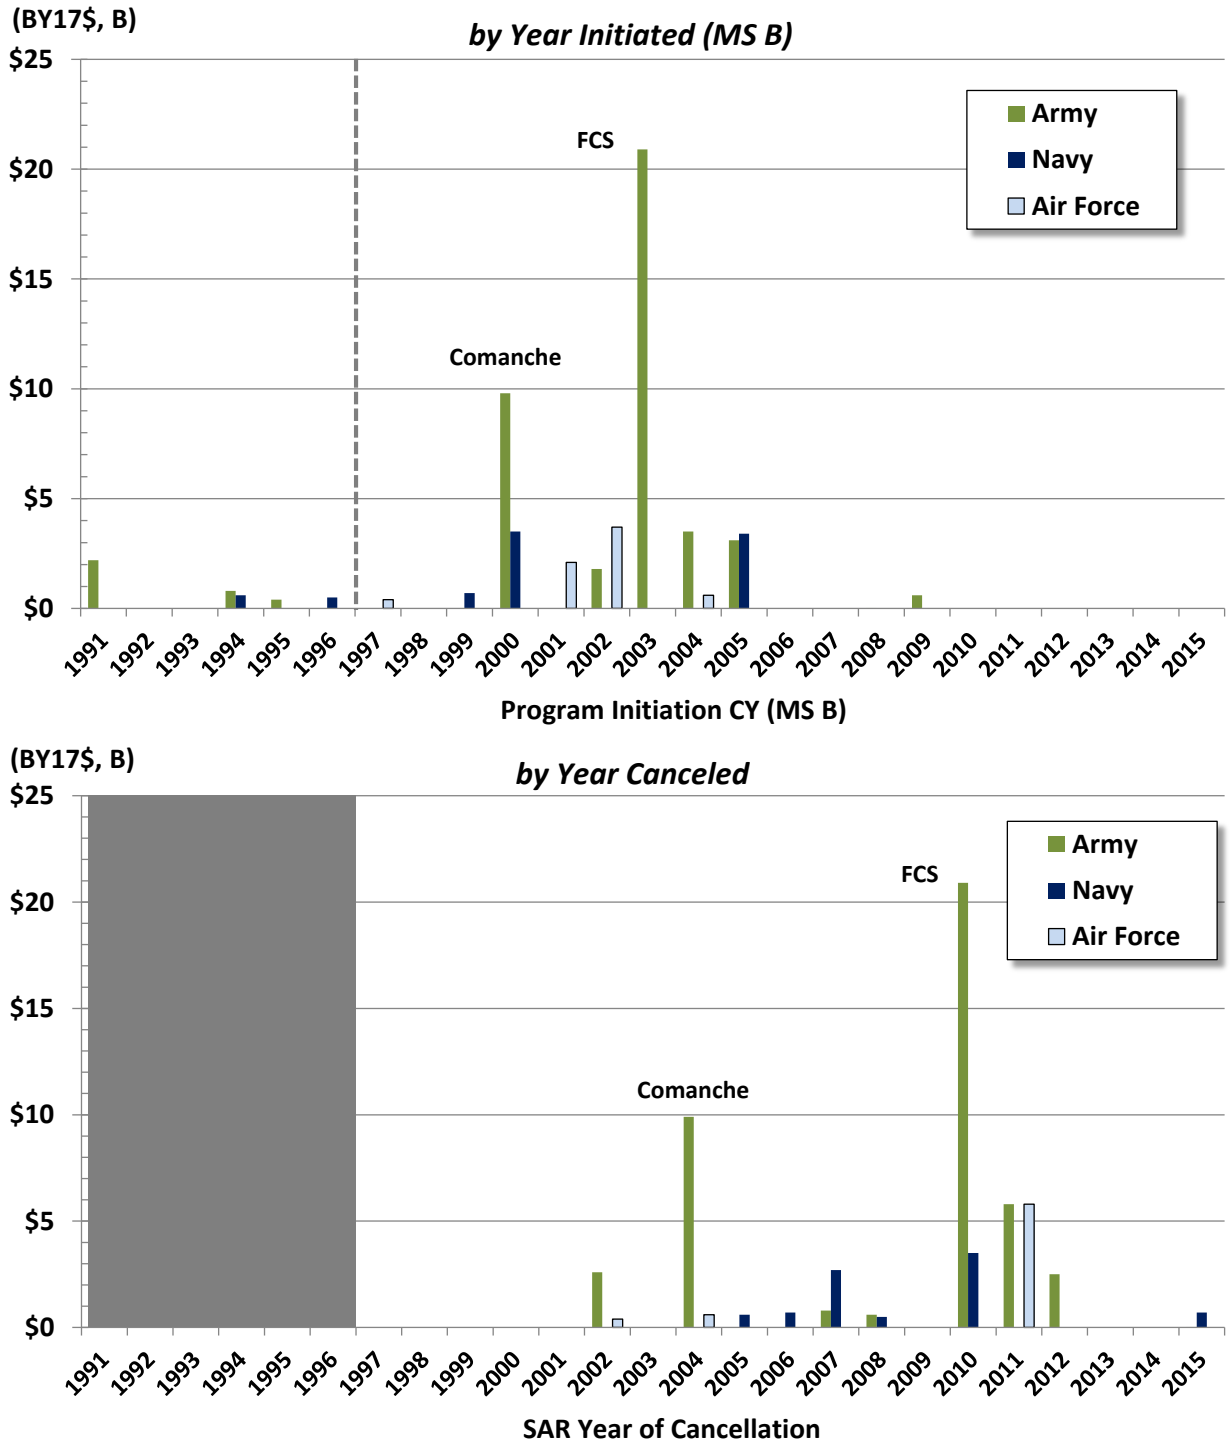

Table 3-6. Approximate Sunk RDT&E Costs of MDAPs Canceled After MS B (1997–2015 SARs)

Program [sub-program]	RDTE Sunk at Cancellation (BY17$, in Billions)	% of Total Sunk	% of Original Baseline Sunk at Cancellation	% of Latest Baseline Sunk at Cancellation	CY of MS B	SAR Year of Cancellation
FCS	$20.7	35%	88%	64%	2003	2010
COMANCHE	$9.8	17%	109%	60%	2000	2004
NPOESS	$3.7	6%	36%	99%	2002	2011
EFV	$3.5	6%	31%	93%	2000	2010

JOINT COMMON MISSILE [JCM]	$0.1	0.2%	10%	34%	2004	2004
AMF JTRS [Small Airborne Link 16 Terminal (SALT)]	$0.02	0.03%	10%	64%	2008	2015
Total Sunk	***$58.3***					
Median	*$0.8*		*82%*	*93%*		
Mean	*$2.7*		*78%*	*82%*		

NOTE: Just over half of the total sunk costs were from the first two programs (yellow highlights). Also highlighted are the eight sunk-cost percentages relative to original baselines that are over 100 percent. Across the 1997–2015 SARs, there were 23 post-MS B MDAPs that did not achieve IOC, 63 MDAPs that were completed, and 50 MDAPs that are currently active but have passed IOC. An additional 25 currently active MDAPs have not yet passed IOC and are not reflected in this analysis since we do not yet know their fate. Program abbreviations are defined in Appendix F starting on p. 159.

Frequency of New MDAP Starts

With sequestration budget cuts and an increased pace of threat evolution, the DoD is concerned that we may be on a path to losing technical superiority. One early indication of this may be the frequency at which new MDAPs are started.

Figure 3-15 shows the 3-year moving average of the number of new MDAP starts. Programs are identified as to whether they started at MS B or whether they did not require EMD and instead started at MS C. The moving average is used to smooth the data and help identify trends. New starts declined to about six per year before 9/11, then spiked in CY 2003–2005. Since 2008, the DoD started about four new starts per year—about half of what we saw in the mid-1990s and two-thirds of the peak in the mid-2000s. New starts are at a historical low, so the concern about the lack of products in the "new product pipeline" seems to be justified.

In terms of dollars, Figure 3-16 shows the total acquisition value of the new starts aligned to their initiation. We saw a small number of spikes in the years 2001, 2003–2005, and 2011. Over all the years from 1997 to 2015, the median annual spend on new starts was about $35 billion. Because of the spikes, the mean was higher at about $60 billion.

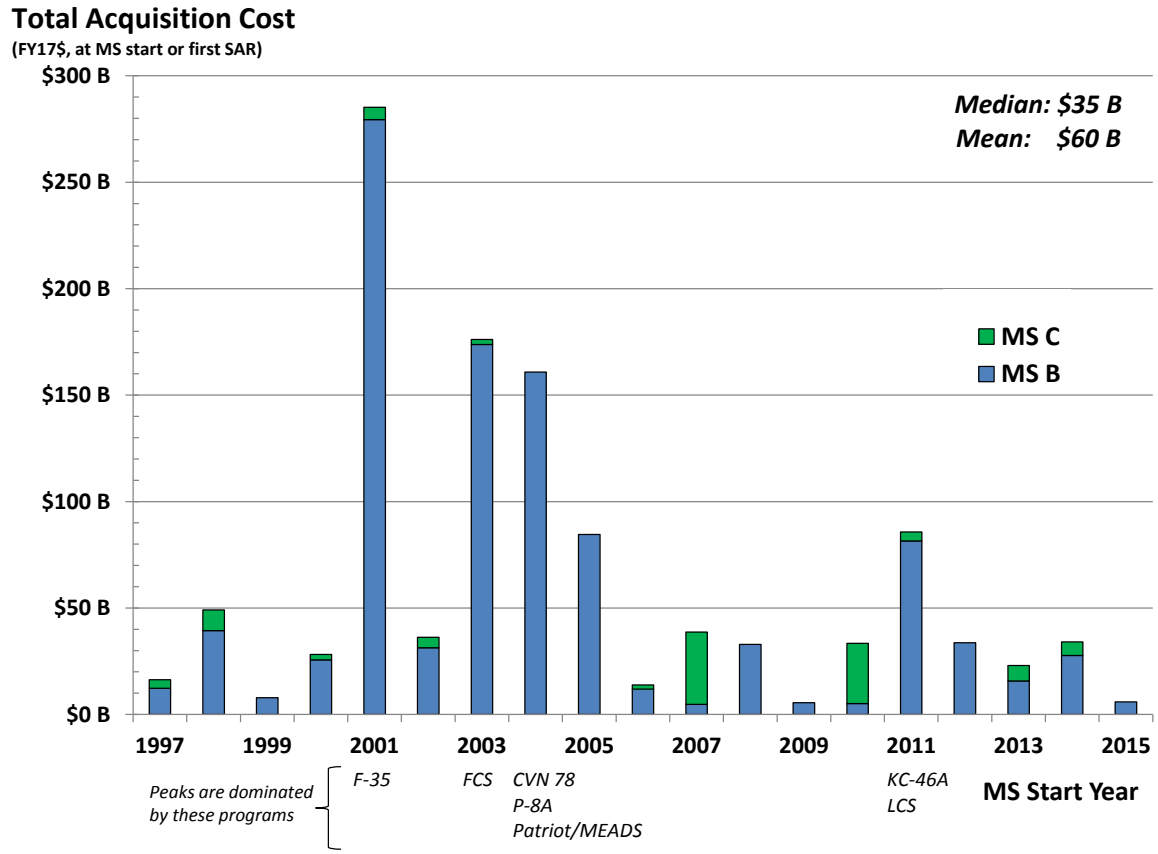

Figure 3-15. Frequency of New MDAP Starts: 3-Year Moving Average (CY 1994–2015)

NOTE: Dates were extracted from CY 1997–2015 SARs, with MS start dates in 1994–1996 extracted from the 1997 SARs. The data points for 1996 reflect the average for CY 1994–1996.

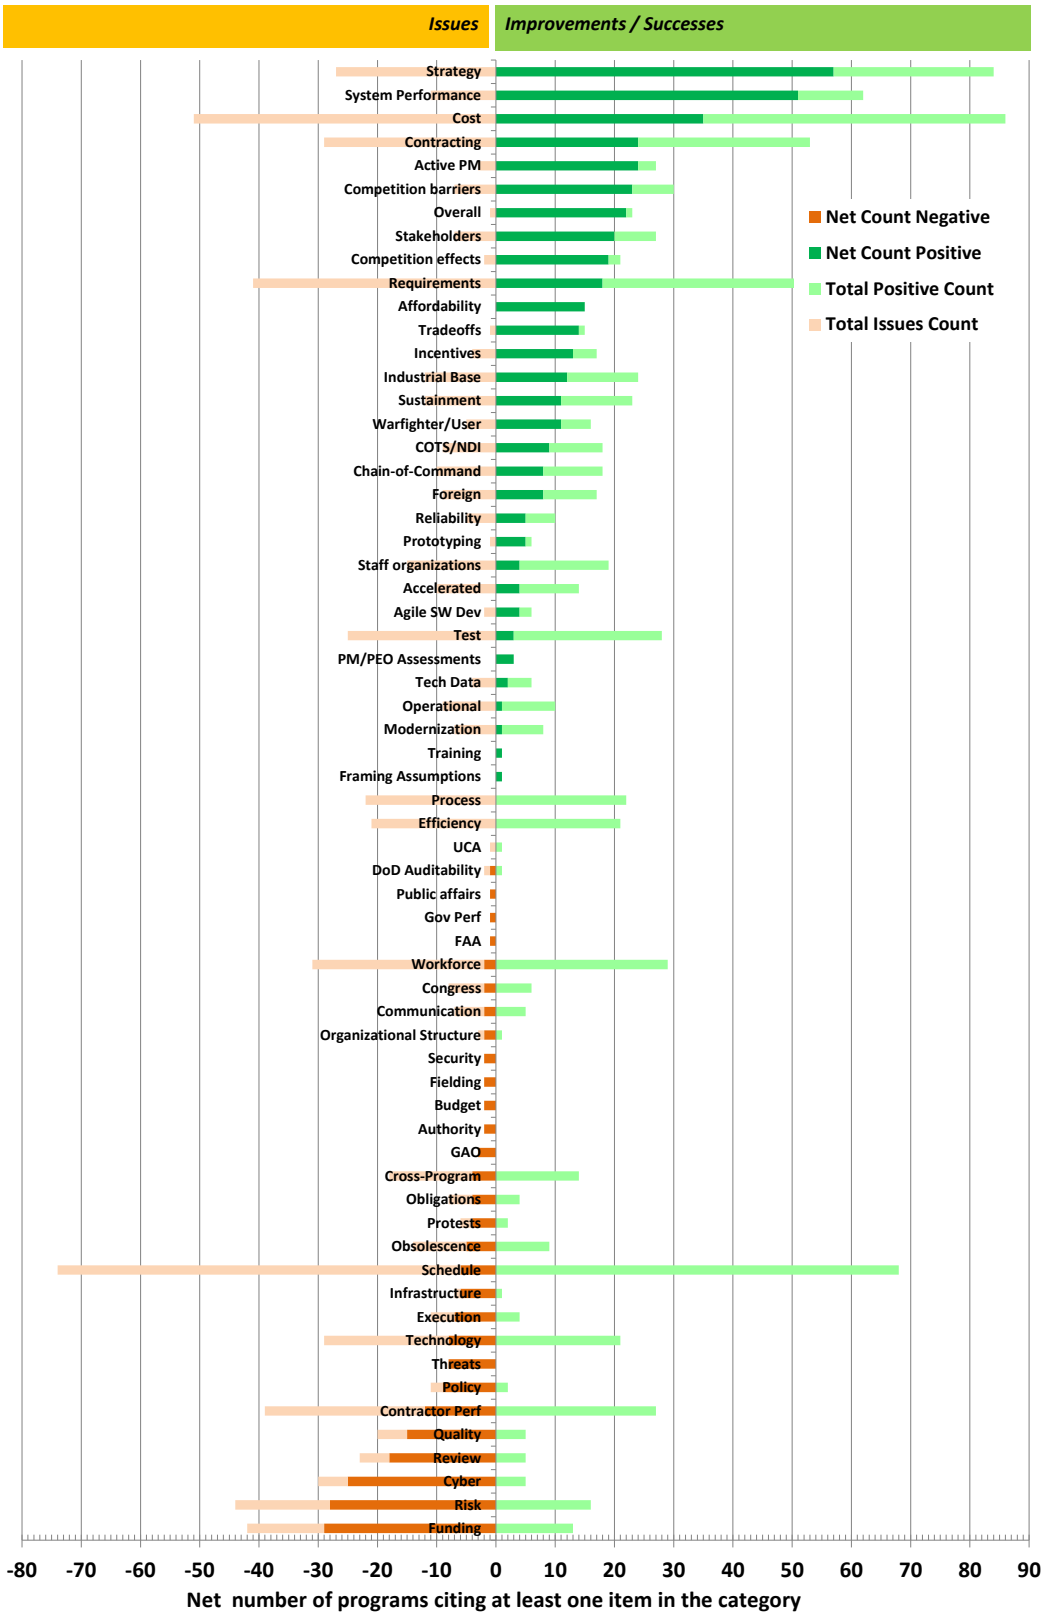
PROGRAM MANAGER ANNUAL ASSESSMENTS

For a second year, the DAE tasked all PMs to provide directly a short (1–3 pages) assessment (with no staff or management review) of the state of their programs.[40] They give candid insights into the challenges and progress in these acquisition efforts.

Below we summarize our frequency analysis of the topics raised by the PMs. Since these assessments are unstructured, this analysis is not a reliable means of calculating the exact percentage of programs that face certain topics, but it does offer an insight into a broader range of topics that our PMs felt were important enough to raise. Here we tagged items raised

[40] Selected PM assessments from the first year were published to provide insights into the real-world successes and challenges facing defense acquisition (USD(AT&L), 2015c).

571 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING



by the PMs with 1–3 topic labels. We then counted how many PMs raised each topic at least once as an issue or as a success. Figure 3-17 plots these counts and their difference.

Figure 3-18 shows the top-15 success topics drawn from Figure 3-17. Note that our PMs tended to be positive about strategy, system performance, program cost, and contracting (although the latter was raised often as both a success and issue).

Similarly, Figure 3-19 shows the top-15 issue topics raised by the PMs. Funding difficulties, risks, and cyber issues top the list. Interestingly, contractor performance was high on the list, but note that contractor performance was raised often as an issue and as a success (i.e., some contractors were performing very well while others were not). Technology and especially schedule issues also had a high number of both positive and negative citations with just slightly more negative than positive.

PROGRAM EXECUTIVE OFFICER ASSESSMENTS

This year, in addition to the PM assessments discussed above, each PEO was directed to submit a short assessment of their portfolios directly to the DAE along with any suggestions they might have for improving defense acquisition. The DAE received a wide range of valuable observations, best practices, and recommendations, including thoughts on improving acquisition efficiency, eliminating bureaucracy, getting more from industry, developing the acquisition workforce, and many other topics.

Below are highlights of the issues and suggestions made by the PEOs that are applicable to wide portions of defense acquisition. In addition, some extracts rendered anonymous were included in a recent *Defense AT&L* magazine article (Kendall, 2016b). This is a useful collection of perspectives, ideas, and recommendations that we are reviewing with the intent of adopting good ideas where we can and stimulating our thoughts on how we can all be more effective. The USD(AT&L) staff in particular is working with the military departments and other elements of the OSD staff on implementation of many of the ideas in the full set of the PEO Assessments.

Balance in Acquisition

Cultural shift from spending to efficiency. We need to continue working on the workforce culture shift from a focus on spending to meet budget execution benchmarks toward employing critical thinking, tailoring, and incentives to be more efficient in both time and money as we equip our warfighters and try to get as much value as possible with the taxpayers' dollars.

Acquisition and the Larger Defense Mission

Pursue larger operational effects, not just program-level acquisition. At the end of the day, the defense acquisition system's job is to provide warfighter capabilities and effects—not just delivering a narrowly defined program. PEOs and other stakeholders are increasingly examining the integrated effects of programs on kill chains and mission capabilities, looking for unforeseen system-of-system interactions, dependencies, and gaps. This is a cultural shift. The processes for program design, requirements, and management are fairly well developed but are often narrowly specified and constrained when trying to identify and change to achieve broader system-of-systems operational outcomes.

Tyranny of the baseline. Programs need levels against which to measure cost, schedule, and technical performance objectives. However, those baselines often constrain the program when dealing with unforeseen technical problems (on a developmental program) or changing threats. Measuring programs against Milestone B baselines is a statutory obligation within the DoD, but new threats and unforeseen engineering challenges commonly arise after that milestone. Management techniques such as block upgrades and subprograms can help isolate and illuminate associated changes for approval by DoD leadership and Congress, but their widespread use is discouraged by the bureaucratic burdens they incur.

575 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

Sunk cost (and past problems). A corollary to the baseline problem is an inability to recognize recent performance progress on long programs. Many PEOs note that some programs are now performing well after major attention and restructuring, but it is hard to shed past sins. Of course, simply rebaselining on a regular basis creates its own problem by concealing problems, so a balance and multiple views are needed.

Managing Risks During Execution

Test and information technology (IT). Program designs, testing, and fiscal resources are closely considered and traded at program initiation to ensure a viable program. In some cases, program requirements may not fully reflect the intended combat environment, and those environments may change with evolving threats. In contrast, the test and IT communities are responsible for ensuring that tests and cybersecurity address current threats. Unfortunately, this can lead to impasses between the program and test/IT community because program funding is based on requirements while testing/cybersecurity evaluations are based on current threats. Additional funding could be required. Although the acquisition chain-of-command will adjudicate many of these conflicting pressures during major program reviews, the infrequency of these reviews makes it difficult to adjudicate these needs and make risk and funding tradeoffs. One PEO suggested that a new process may be needed (e.g., bringing test and cybersecurity mandates under Configuration Steering Boards (CSBs)) to balance these risks, tradeoffs, and funding demands during execution.

IT upgrades and testing. The pace of IT changes to systems (from threats, system-of-systems needs, and technical opportunities) is significantly shorter than the timelines required to perform tests—especially if numerous deficiencies are found that must be fixed and retested. Policies, processes, and approaches for efficiently testing incremental system changes are not always employed. Approaches currently being used with some success include ensuring that earlier defects are addressed, incremental testing that leverages earlier test results, using automated software regression test tools, and other best practices.

Risk management. New frameworks for assessing risks—combined with IT staff incentives to drive risks to near zero—can lead to excessive focus on risk mitigation rather than balanced management. Many PEOs complained that, rather than facilitating quick consideration of key risks, the recent Risk Management Framework (DoD CIO, 2016) is overly bureaucratic, complex, ill-tailored for weapon systems, and hard to satisfy. More implementation refinement may be needed to make the use of the framework more efficient, effective, and responsive.

Challenge and Inform Requirement Decisions

Use Configuration Steering Boards (CSBs) for lower ACAT programs. As with major programs, it would be useful to have CSBs refine requirements and conduct tradeoffs for lower ACAT programs during execution. As the Army has found, this may need to involve delegation to boards below the Service Chief level due to the much larger number of lower ACATs.

576 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

Treat every decision as if it uses your own money. One way to personalize acquisition performance is to ask staff to treat every decision as if the implications consume their personal money. This motivates early analysis of the cost, schedule, and technical risks associated with requirements, informing tradeoffs and requirements tailoring by the requirements community.

Workforce Levels

Workforce levels not fully recovered from 1990s reforms. While we have seen total increases of 25% in the acquisition workforce since FY 2008, some PEOs mentioned that their staffing levels are below validated requirement levels—even for their highest priority efforts. For example, one PEO cited a 50% increase in program dollars being executed but a 47% decrease in the acquisition workforce in their area since FY 1995. Efficiencies are being pursued, but many hinge on processes outside the program and PEO's control.

Workforce sufficiency review at milestones. Currently, a program is not allowed to proceed without both validated requirements and sufficient budgetary resources matched to cost estimates. Similarly, sufficient workforce levels should be ensured before a program is approved. Otherwise, the program should be re-scoped or not allowed to proceed. This would entail a major change in the way programs are reviewed but would formally recognize the importance of having a sufficient workforce for program success. Workforce sufficiency is difficult to ascertain in a purely quantitative fashion, so expert judgment and reviews would need to be used.

Workforce levels enable savings and are independent of force structure. The significant savings achieved in recent years depend on having a sufficient workforce that can pursue customized approaches rather than just spending money. Multiple PEOs asserted that recent savings outweigh the cost of the entire acquisition workforce. Unfortunately, headquarter budget cuts are reducing Government and contractor staff support to programs from PEOs, buying commands, and defense agencies. These cuts are endangering recent efficiency gains and degrading basic program management support. Such arbitrary cuts (without associated reductions in process streamlining) do not reflect the fact that the acquisition management workload is generally independent of quantity reductions associated with force-structure reductions. The management workload is also highly affected by the increasing pace of system upgrades to address increasing kinetic, electronic, and cyber threats.

Hiring. While having special hiring authorities helps, it still takes too long (e.g., over 100 days) to hire someone, which makes our offers too late for consideration (regardless of our salary levels) when trying to hire students directly out of college. Also, since we are generally precluded from hiring retiring O-5 and O-6 officers, we are seeing excellent candidates with 20+ years of experience walk out the door.

577 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

Workforce Learning and Culture

Learning through "Whiteboard" sessions by leadership. Some leaders are conducting in-person reviews of acquisition strategies to facilitate staff learning while increasing innovation and developing more tailored and effective strategies.

Employee shadowing of senior leaders. One PEO established a practice of selecting employees to join him for two weeks at all meetings and events as a learning experience. This on-the-job training illustrates how to think critically and creatively about key acquisition elements such as acquisition strategies, contract type selection, design of contract incentives, and source-selection approaches while broadening their perspective.

Town hall meetings. Regular, informal town-hall meetings provide valuable venues for senior leaders to clarify the intent behind initiatives, offer examples of innovative acquisition, and illustrate how to think creatively to design better acquisition programs. Such meetings also facilitate feedback to senior leaders of challenges and issues "in the trenches."

Stakeholder training. Stakeholders within the DoD Components and in Congress often lack basic understanding of defense acquisition processes and their respective roles in it. This results in time lost answering questions far outside acquisition responsibilities (as well as the generation of uninformed reform ideas).

Acquisition Strategy

Commercial items. COTS and NDI usually (or even "only) work for defense systems when the requirements, usage, and environments match exactly. This results in fairly low appropriateness at the system level (where functions, requirements, and "-illities" often differ) but increasing appropriateness at part levels.

Limitations of rapidly acquired systems. Because rapidly acquired systems are based on readily available and often commercial components, they share many of the COTS/NDI issues above. Also, they are often difficult and costly to sustain in the long term, difficult to convert to a regular program of record, and are often effective against only a narrow range of threats.

COTS obsolescence. Challenges in replacing obsolete COTS components are increasing, especially for IT elements. For some longer programs, upgrades may even be required before initial fielding. Replacements, lifetime buys, and upgrades must be built into strategies, budgets, and staffing plans throughout the life cycle, but some statutory fiscal rules can limit flexibility and options that save money in the end.

Software development and integration. The DoD continues to find that giving prime contractors responsibility for major software block upgrades is risky. Heavy Government involvement and rapid, incremental approaches (e.g., through Agile development) have been successful, but they also point to the need for reforms in how we conduct testing and risk management. Some PEOs also mentioned that Agile software development has been very beneficial in accelerating and improving software development, but success hinges on use of cost-reimbursable contracting and flexible operational testing approaches.

578 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

Fixed-price contracting. One PEO noted that "a fixed-price contract type is every bit as challenging as a cost-plus vehicle, albeit in different ways." We cannot use Government money to solve problems that endanger the program; we cannot change requirements (despite needs); we must keep the funding profile stable, and we can require only the performance and product we placed on the contract (nothing more).

Risks versus savings. Savings are not always risk or consequence free. While BBP's goal is savings that do not decrease capabilities, some approaches can increase cost, schedule, or technical risks and must be weighted as such.

Processes and Impediments

Agility. PEOs raised the following as factors hampering agile acquisition:

- Requirement decision cycles that are longer than technology and threat change cycles (especially for areas such as cyber).
- Funding cycles that are longer than technology and threat change cycles.
- Strong external and internal disincentives for staff to pursue options that come with any personal risks.
- Testing cycles that are longer than agile software development cycles or require full system tests when only components are upgraded.

Tailoring. While PEOs, other leaders, and the DoDI 5000.02 emphasize tailoring the acquisition process, testing, and oversight to each specific program, the PEOs report that success is mixed in getting PMs and oversight staff to pursue tailoring. Institutionalizing this cultural shift will require continued training and leadership emphasis.

Rapid acquisition. We have good processes in place to acquire (nondevelopmental) systems rapidly, but finding the money is often the biggest impedance, because we do not have a ready reserve of funds. Furthermore, rapid acquisitions require significant staff work that must come out of existing staff, adding workloads and growth to normal program progress when large numbers of Urgent Operational Needs arise in a particular area or portfolio.

Obligation and expenditure monitoring. Measuring program financial performance solely on goals can be problematic. Performance also needs to take into consideration actual execution situations (e.g., delays due to negotiating better prices or constructing effective contract incentives).

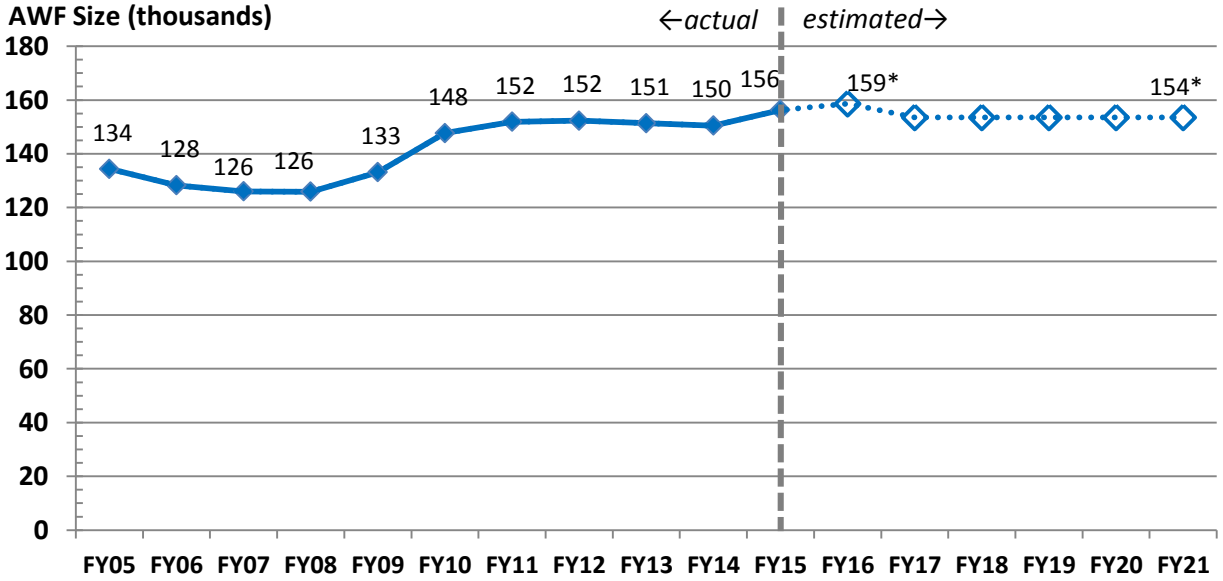
Value of oversight. While some issues remain, the PEOs often identified places where OSD staff and individuals offer value in streamlining processes or providing assistance. Continued progress is needed (as can be seen from other comments) to improve and retain value.

579 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

4. Input and Process Measures

Finally, we examine input and process measures of the defense acquisition system. While these do not directly reflect the outputs and outcomes, some are contentious topics for which it is useful to examine the available data, while others such as competition rates and small-business utilization have conceptually important ties to outcomes and thus have assigned goals.

Defense Acquisition Workforce



The DoD has made significant progress toward strengthening capability and advancing professionalism of the Acquisition Workforce (AWF). Since we started BBP in 2010, we have rebalanced and increased the size of the workforce to meet challenges and emergent threats. Significant investments also have been made to improve workforce quality. Our strategy is to responsibly sustain and build on these improvements as resources allow. We will continue to improve our analysis of required staffing levels and demographics. We also seek to increase professionalism by concentrating on certification, education, training, and experience, expanding our pool of qualified leaders at all levels, and addressing current and future workforce challenges as they arise.

Improving the Workforce

Recruiting and hiring. Throughout the DoD, Components have used the DAWDF to rebuild, reshape, and sustain the workforce in critical functional areas through targeted hiring strategies and retention efforts. Figure 4-1 and Table 4-1 show the results of these efforts. Of note are the significant personnel increases since the low point in FY 2008, especially in contracting, program management, engineering, life-cycle logistics, and information technology.

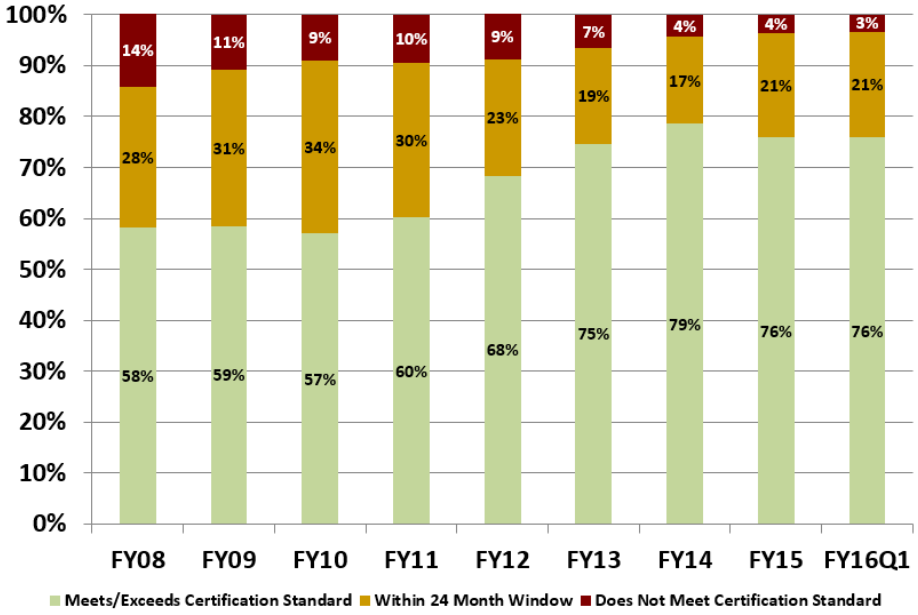
NOTE: The low point in total AWF was FY 2008. Increases in workforce levels from the prior year are shaded purple, as are positive percentage increases since the low point (FY 2008) and last year (FY 2014). Significant reductions in the Unknown/Other category reflect efforts across DoD to ensure that acquisition data fields are correctly applied on all personnel actions.



581 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

Training and development. The imperative to improve workforce qualification and certification has been championed through our BBP objective to "establish stronger professional qualification requirements for all acquisition specialties."

Since BBP 2.0 in 2012, OSD and military department leadership have stressed the importance of increasing certification rates across the AWF.[41] An increase in Defense Acquisition University course availability and the elimination of bottlenecks in the training path have contributed to higher certification rates. We also expanded training and deployed acquisition tools and specialized workshops to support the workforce on the job, resulting in a more proficient and capable AWF.

Figure 4-2 illustrates some progress made in training, showing the percentage of AWF members already meeting certification standards for their current position or who are within the 24-month grace period since starting. The fraction out of compliance has dropped from 14 percent to 3 percent while the fraction meeting standards has risen from 58 percent to 76 percent (about 3 percent less than last fiscal year). The number of workforce members who have failed to achieve the required level of certification within 24-months of assignment has decreased to a new low of 3.3 percent in the first quarter of FY 2016, and we strive to continue lowering this metric.

Figure 4-2. Acquisition Workforce Meeting Certification Standards (FY 2008–2016Q1)

[41] Civilian and military acquisition personnel (but not support contractors) must achieve certifications specific to their career field and position requirements. Individuals who lack the necessary certifications when starting a position must become certified within 24 months. While the courses required for certification depend on the specific acquisition career field, acquisition courses generally cover risk management in system acquisition; the JCIDS process; statutory, regulatory, and decisional contracting; acquisition law; EV management; and budgeting (among other topics).

582 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

Key leaders and qualifications. Another major BBP workforce initiative establishes qualification standards for Key Leadership Positions (KLPs) and a board prequalification review of workforce members who may apply for KLPs in the future. Not only does this further establish educational, experience, tenure, and cross-functional competency standards, but obtaining a board prequalification for a KLP serves as an important performance and career credential.

Retention and recognition incentives. In order to restore, sustain, and continuously improve the quality of the AWF, sufficient and stable funding is required. Congress established the dedicated DAWDF in 2008 to help ensure the DoD would have "the capacity, in both personnel and skills, needed to perform its acquisition mission, provide appropriate oversight of contractor performance, and ensure the DoD receives best value for expenditure of public resources."[42] The DAWDF supports efforts to meet the DoD's workforce challenges and restore the organic defense AWF by funding initiatives in three major categories: recruitment and hiring, training and career broadening, and recognition and retention. Congress has continued to support the DoD's efforts to strengthen and improve the quality of the AWF, including strong support for the DAWDF. Since 2010, there have been several adjustments to the fund, most significantly establishing its permanency in the FY 2016 NDAA.

Accomplishments of FY 2010 to 2015 AWF strategies. The AWF was downsized by 56 percent before 2010 as part of the laissez-faire approach to acquisition in the mid-1990s. The DoD fell below acceptable staffing levels (especially as Government oversight was re-invigorated in the early 2000s), and the focus in the past was simply to ensure that we had the numbers to minimally accomplish a narrowed mission. The DoD's 2010 growth strategy addressed the need to rebuild capacity, improve quality, and rebalance the workforce to ensure that effective oversight and inherently governmental responsibilities[43] are performed by appropriate individuals.

The continued efforts to improve the AWF have increased its size by 24 percent, from just under 126,000 in FY 2009 to over 156,000 in FY 2015. We have also worked to increase the quality of the AWF through higher education levels, increased training, and more focused experience. The number of staff holding bachelor's degrees or higher increased from 77 percent of the 97,730 members in FY 2008 to 84 percent of the 131,316 members in the first quarter of FY 2016. The number of staff with graduate degrees for the same period has risen from 29 percent to 39 percent of the workforce.

Another workforce demographic problem was the low number of mid-career staff as measured by years to retirement eligibility (Figure 4-3). Strategic hiring in both early- and mid-career level, as well as strategic investments in critical functional areas, has significantly improved the size of our mid-career staff. The demographic of the hiring profile is more clearly visible in Figure 4-4, which approximates the hiring across the career life cycle between FY 2008 and FY 2015.

[42] 10 U.S.C., Section 1705, Defense Acquisition Workforce Development Fund

[43] See, for example, Office of Federal Procurement Policy (OFPP) Policy Letter 11–01, "Performance of Inherently Governmental and Critical Functions," *Federal Register*, Vol. 76, No. 176, Sept. 12, 2011.

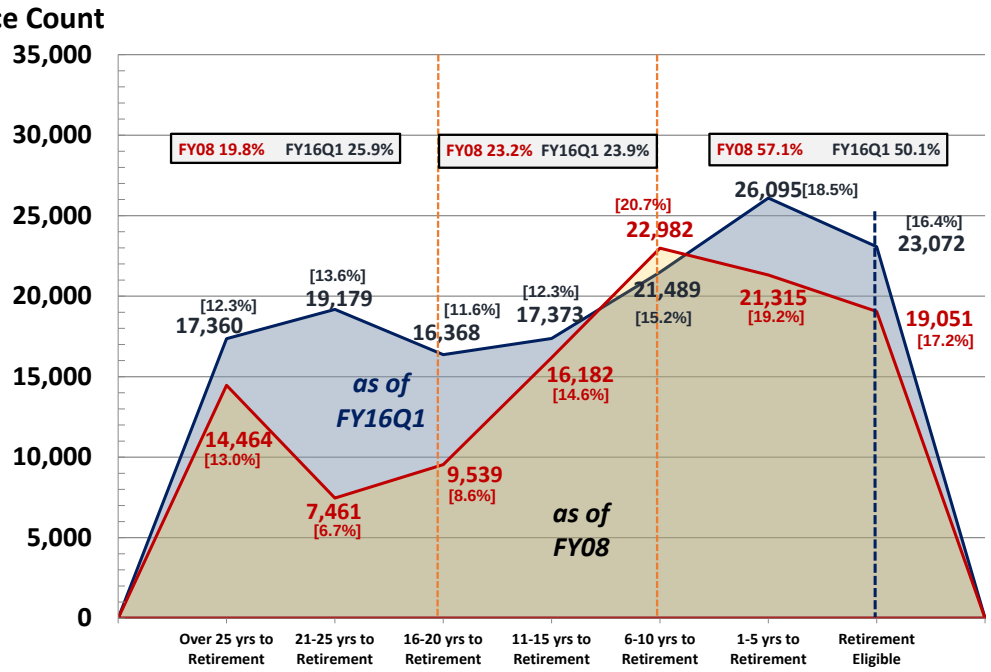
Figure 4-3. Civilian Acquisition Workforce Demographics (FY 2008–2016Q1)



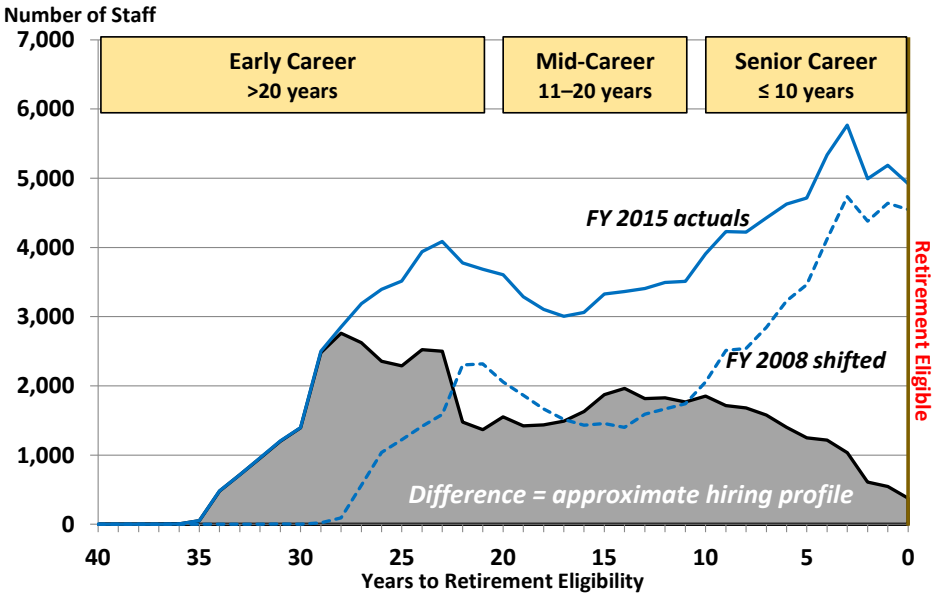


Figure 4-4. Change in Civilian Acquisition Workforce Demographics from FY 2008 to 2015

NOTE: The dashed curve shows the FY 2008 staffing profile has shifted 7 years closer to 0, approximating the experience and career aging of those staff between FY 2008 and 2015. The shaded area shows the difference between the two curves, approximating the hiring demographic between the two years if there had been no attrition. Hiring to account for attrition would be added on top of the shaded region.

Innovating new AWF strategies. The DoD initiated a one-day joint forum to bring together key DoD Component stakeholders and subject-matter experts to jump start solutions for recruiting, hiring, and retention. The first joint "Workforce Summit" was held in July 2015 and a second in May 2016. Bringing together all the players in one forum has been very effective. The summits

584 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

fostered significantly improved understanding of problems and drivers, available authorities, legislative solutions (such as the college student direct-hire authority in the Senate's FY 2017 NDAA bill), and best practices. Best practices include how to effectively use the Expedited Hiring Authority, the Navy's very effective and efficient centralized journeymen and entry-level program, the Student Training and Academic Recruitment program, and initiatives to improve hiring processes and the use of special authorities (such as the Army's stand-up of a "hiring cell" to pilot process improvements). As a result of the July 2015 summit, the DoD updated our Expedited Hiring Authority policy and established a joint Incentives Integrated Product Team (IPT) to focus on how to improve use of incentives. The next joint summit is scheduled for November 2016.

Force of the Future. As part of the DoD's Force of the Future initiatives, we are actively pursuing a direct-hire authority to accelerate offers for college students. We are also increasing the use of Science, Mathematics and Research Transformation scholarships and leveraging the Student Training and Academic Recruitment program.

Performance Incentives

Incentives IPT. This IPT was established to evaluate how we are using incentives, including recruitment and retention bonuses, student loan repayments, and other monetary and nonmonetary incentives to improve hiring and retention outcomes. The team is evaluating how to improve the use of incentives across the workforce, especially to lower barriers to usage and to share best practices to facilitate use. The team is developing a strategic plan to communicate existing policy and guidance as well as best practices for incentives implementation, resulting in an overall strategy for all DoD Components to use for their respective workforce.

Awards. The DoD has also expanded its awards programs and added a Should-Cost and Innovation Award as part of BBP to recognize exceptional performance and help instill a cost-conscious culture. The *David Packard Excellence in Acquisition Award* (first given in 1997) is the DoD's highest acquisition team award and now emphasizes superior program management or successful execution of one or more BBP initiatives to reduce life-cycle costs. The *Should-Cost and Innovation Award* began in 2014 and recognizes outstanding commitment, innovation, and results in Should-Cost management.

In addition, two other major awards are the *Defense Acquisition Workforce Individual Achievement Award* and the *Defense Acquisition Workforce Development Award*. Individual Achievement Awards are given for excellence in 18 categories: acquisition in an expeditionary environment; auditing; financial management; cost estimating; contracting and procurement; engineering; facilities engineering; industrial and contract property management; information technology; life-cycle logistics; production, quality, and manufacturing; program management; science and technology management; test and evaluation; EV management; requirements management; services acquisition; and small business. The *Workforce Development Award* recognizes acquisition organizations that have made exemplary contributions to the career-long development of their workforce.

585 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

BID PROTESTS ON DOD SOURCE SELECTIONS

A bid protest is a legal challenge to a solicitation or contract award for the procurement of goods or services.[44] The GAO is a primary adjudicator of bid protests concerning Federal agencies and departments (including the DoD).[45] Once a protest is filed, the GAO has 100 days to issue a decision. A bid protest can have four different outcomes: *dismissed*, *denied*, or *sustained* by the GAO, and at any time it can be *withdrawn* by the protester.[46] In addition to the full decisions, the GAO tracks these four outcomes by protester. Denials and sustainments are definitive (although appeals are possible). However, we cannot tell from these summary data the frequency with which dismissals and withdrawals resulted in any accommodations or corrective actions by the Federal agency. Note also that some actions incurred more than one filing (i.e., a primary protest and subsequent filings). Finally, even though a company might "win" a protest (either through a sustainment or possibly in early agency actions causing a withdrawal or dismissal), revisions to a source selection may not necessarily result in a change of who is awarded the contract in the end.

Annual DoD solicitations in FedBizOps have been increasing since FY 2007, when they numbered about 35,000, and now number about 52,000 in FY 2016. In contrast, the total number of protests against these actions ranged from just over 600 in FY 2001 to a high of 1,365 in 2013 (Figure 4-5). Thus, the recent protest rate has averaged about 2.5 percent of solicitations. Note that annual contract awards are about an order of magnitude higher, so if we counted protests against contract awards (i.e., using the number of contract awards in the denominator), then the average would be one-tenth the size (i.e., about 0.25 percent).

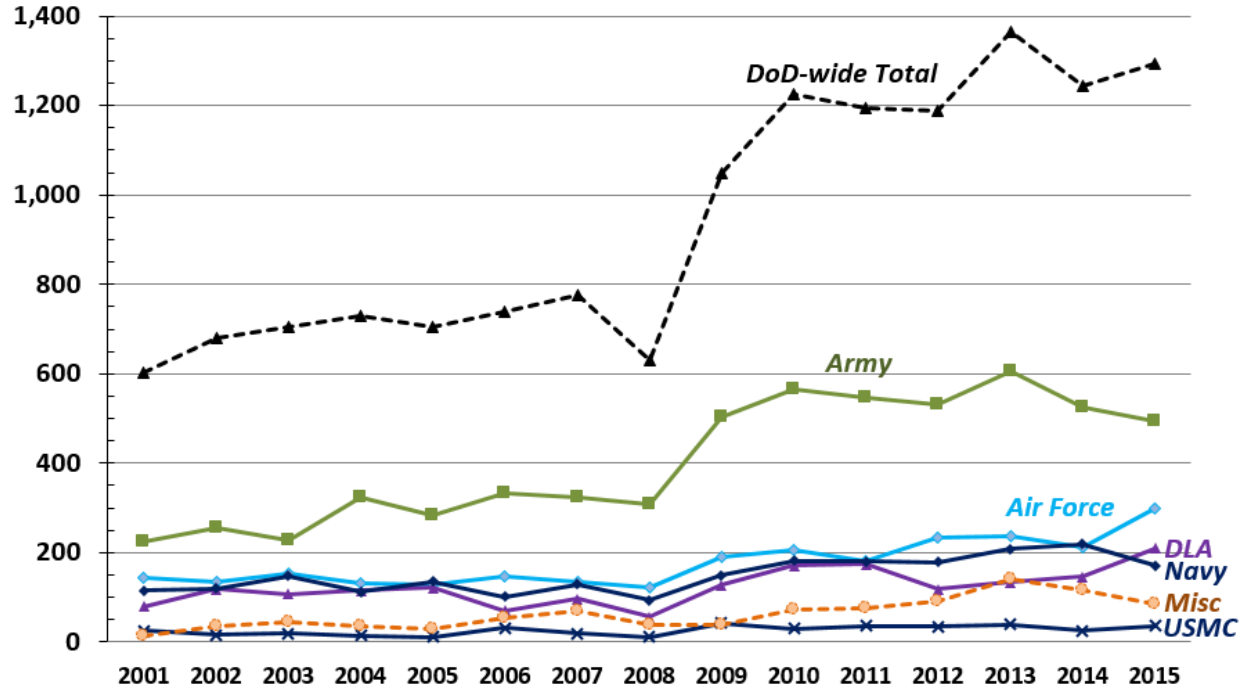
While there has been a sharp increase in the absolute number of protests since 2009 (especially for the Army), the number of solicitations since FY 2007 has increased only by half, and the number of protests sustained per year by the GAO has remained steady at about 30 per year, dropping to 15 in 2015 (Figure 4-6). As a result, the sustainment rate has been running about 2 percent since 2009 and recently has been below the Federal total, which includes the DoD (Figure 4-7). In 2015, the sustainment rate was just over 1 percent. The individual sustainment rate for the Army (not shown) has been low and comparable to the other DoD Components

[44] "An interested party may protest a solicitation or other request by a Federal agency for offers for a contract for the procurement of property or services; the cancellation of such a solicitation or other request; an award or proposed award of such a contract; and a termination of such a contract, if the protest alleges that the termination was based on improprieties in the award of the contract." (4 CFR 2.1)

[45] Bid protests can also be handled by the procuring agency or the U.S. Court of Federal Claims. Thus, these data provide a view into a significant number of (but not all) bid protests.

[46] Note that bid protests are an integral part of a government acquisition system that has a core value of treating all bidders fairly. (There are no protests in commercial business transactions.) The protest system imparts an incentive to ensure that solicitations and awards are conducted properly. The number of protests *sustained* provides an independent indicator of the quality of the DoD's source selections, independent of how many protests there are. See http://www.gao.gov/legal/bids/bidprotest.html as well as Schwartz and Manuel (2015) for more information on the GAO process and timeline.

586 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING



despite the rise in protest numbers against the Army. Thus, the increased number of protests appears to reflect external Industry strategies or competitive pressures (possibly from the declining DoD budgets) rather than poor DoD source-selection performance. Note that while the DoD-wide number of sustainments appears to be dropping slightly over time, the trend is not statistically significant.

Despite the uncertainties in the data from withdrawals and dismissals, these data provide useful bounds on DoD's performance. In addition to the definite sustainment rate of 2 percent, the definite GAO denial rate is about 25 percent. When combined with the numbers of annual solicitations and contract awards, the number of solicitations that involved some kind of DoD accommodation was somewhere between 2 percent (using the denial rate as the upper bound) and 0.05 percent (using the sustainment rate as the lower bound). In other words, the number of some kind of technical issue with source selections is at worst 2 out of every 100 solicitations and could be as low as 5 out of every 10,000. If plotted, even the worst case would barely be visible, and the best case would not be visible at all. Again, these rates would be one-tenth the size if measured against the annual number of contract awards. Note that these are on an action basis, not on the basis of the dollars involved (which would require further data collection and analysis to ascertain).

These results are commensurate with the Congressional Research Service's recent analysis of bid-protest rates (Schwartz & Manuel, 2015). Also, these results align with efforts over the last few years to ensure that source-selection rules are clearly defined, reflect the DoD's priorities, and are followed in execution (e.g., peer reviews of contracts for supplies and services [DDPAP, 2008, 2016c]). Additionally, the emphasis on eliminating unnecessarily complex selection criteria and ensuring source selections are well documented may be factoring into source-selection success. The DoD Source Selection Procedures that were issued earlier this year capture these tenets (DDPAP, 2016a). These procedures also capture the BBP initiative to identify up-front how much we value higher performance levels so that bidders can make informed decisions on how to position themselves to maximize their competitive posture and so that the government has a clear, objective way to evaluate such differences.

Bid Protest Rates and Outcomes by Company

We also examined the number and outcomes of protests from the second quarter of FY 2005 through the end of FY 2015 from individual contractors to try to gain insights into whether some companies may be filing proportionally larger numbers of unfounded protests compared to the population as a whole.

Table 4-2 lists by name the protesters that definitely lost (i.e., were denied by GAO) at least three protests. As noted above, the overall loss (denial) rate is about 25 percent, and the overall win (sustainment) rate is about 2 percent. While there are a number of protesters with loss rates over 25 percent and win rates below 2 percent, there are only six that had double-digit protest numbers. More importantly, all protesters except Latvian Connection were one win away from having a sustainment rate above the 2 percent average. Also, all but two companies (Bay Area Travel and Cruise Ventures) had withdrawals and dismissals (with uncertain consequences). All told, it is not possible from these summary data to identify any companies that have significantly larger numbers of unfounded protests. Table 4-3 and Figure 4-5 together list the 100 largest DoD contractors (by dollars obligated in FY 2014) that filed bid protests with the GAO. Here we see that many (but not all) of our largest prime contractors have filed protests, and those that have lost all their protests tend to have filed very few.

Finally, Table 4-5 and Table 4-6 together list the top 100 companies with the largest numbers of bid protests to GAO regardless of outcome. Note that the number of protests is highly skewed, falling sharply from the maximum.

589 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

The only definitive case of excessive unfounded protests is Latvian Connection, LLC. This company had a very high total number of DoD protests (251) since FY 2005, but these data showed nearly all with uncertain consequences (withdrawn or dismissed). However, GAO reported separately that Latvian Connection was suspended in August 2016 from filing protests with GAO for one year due to abuse of the GAO protest process.[47] We are not aware of any other companies that have ever been suspended by the GAO from protesting, so this appears to be unique.

Interestingly, we note a few cases where Federal agencies or departments appear in the data as protesters. These are requests for reconsideration of GAO sustainment decisions. Table 4-2 shows that the Small Business Administration filed four protests and the Marine Corps filed three. All were denied (as were the two Air Force and one Army protest).

Further analysis is needed to determine whether the withdrawals and dismissals from such companies were associated with accommodations or corrective actions by the DoD. Analysis is also needed to determine the frequency at which actions by the DoD are taken to simply accelerate acquisitions and avoid problems despite no clear basis or problem with a solicitation or award. Finally, further analysis would be needed to determine whether any changes to the source selection led to different awardees in the end.

[47]The GAO decided that the "Protest challenging the issuance of a task order to a large business concern is dismissed for abuse of process, and the protester is suspended from protesting for a period of one year, where the protester has submitted 150 protests this fiscal year, challenging an array of acquisitions (some of which were fully performed years earlier) conducted by a host of contracting agencies worldwide; has repeatedly failed to demonstrate that it is capable of, or interested in, performing the solicited requirements; and has repeatedly failed to engage constructively on the substantive and threshold issues raised by its protests." (GAO, 2016)

595 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

Rates of Competitive Contracting Across the DoD for Goods and Services

Competition—both head-to-head on contract competitions and environments that introduce competitive pressures in other ways—is a central tenet of our BBP initiatives. When viable, competition is, perhaps, the single best way to motivate contractors to provide the best value (i.e., the best performance at the lowest price). We have set a strategic objective to increase the percentage of spending on competed contracts from current levels. The military departments each analyze projections of future acquisitions to identify opportunities and creative strategies for future competitive awards.

Figure H-17, shown earlier on page xliii, plots the percentage of all DoD contract dollars competitively awarded from FY 2006 through FY 2015. Since goals were established in FY 2010, we had declining actuals until we made progress toward reversing the trend in FY 2014. However, competition rates declined in FY 2015 despite an increased goal for that year.

Challenges to increasing competition rates include high-value sole-source Foreign Military Sales as well as large remaining production runs for ships and aircraft that have already passed their competitive development phase. Increased industry bid-protesting of source selections also force the DoD to award sole-source contracts to provide "bridge" goods and services in the interim until the protests are resolved and the new contracts can be awarded. Fiscal uncertainty, including continuing resolutions and continued downward pressure on base and Overseas Contingency Operations funding, will negatively affect FY 2016 and future competition rates.

Despite these challenges, the DoD is continuing to pursue various approaches for breaking out system components for competition, opening system architectures for competing components and upgrades, and identifying new competitive sources. Beyond this kind of head-to-head competition, we are also expanding the types and use of other competitive environments to drive performance and cost savings (USD(AT&L), 2014b). For example, the Navy's evolving Profit-Related-to-Offer techniques adjust profits and production share between two captive shipyards based on bidding and cost control. Finally, analysis is continuing to set goals based on what is achievable rather than on simply setting goals based on prior actuals.

Small-Business Participation

Pursuing small-business utilization goals has been both a statutory requirement and administration priority because of the potential benefits from small-business contributions in both innovation and efficiency. More small-business engagement can increase the competitive nature of our solicitations, resulting in better cost and schedule performance on contracts. Small businesses also can infuse new, innovative technical solutions as capabilities are pursued for U.S. warfighters.

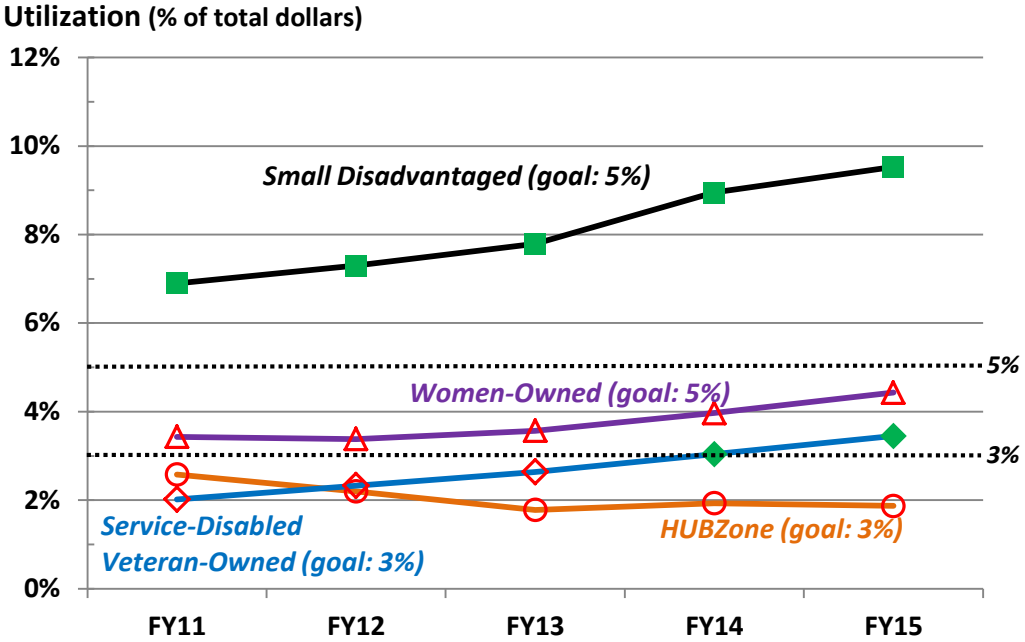

Figure H-14, shown earlier on page xl, plots actual DoD-wide small-business utilization (measured by obligations) relative to yearly goals for prime contracts. Recent trends since FY 2011 have been steadily improving; we exceeded our FY 2014 and 2015 goals by 2.1 and 3.0

596 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

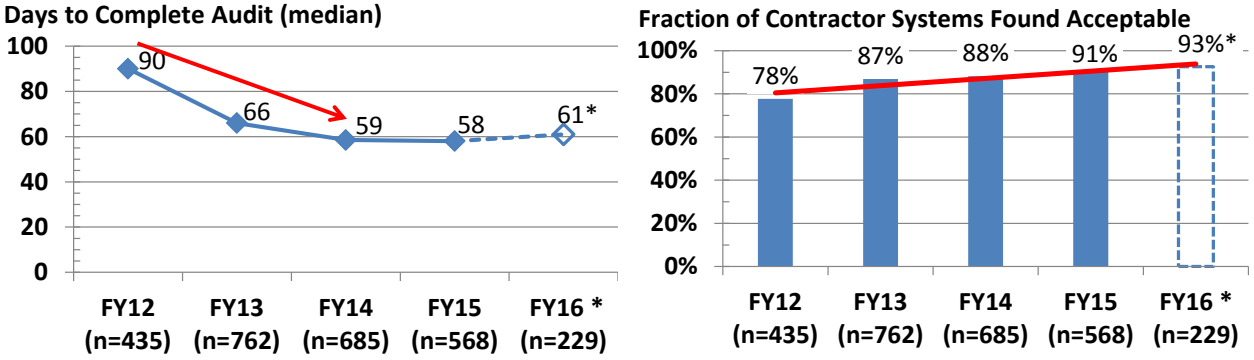
percentage points, respectively, surpassing all prior years except FY 2005. The DoD continues to explore new ways to pursue small-business utilization in the face of continued large-program spending on systems such as the F-35. For example, instead of relying solely on leadership emphasis and policy directives, the DoD is developing and deploying new tools to help PMs, buying commands, and acquisition leadership to monitor small-business utilization in depth, identify and share utilization opportunities, and conduct and share market research.

In specific subcategories of small-business concern, however, the DoD's utilization has been rising in three of four categories but not for Historically Underutilized Business Zone (HUBZone) contracting. Figure 4-8 shows that Small Disadvantaged contracting goals have been met since FY 2011 and Service-Disabled Veteran-Owned goals have been met since FY 2014. Women-Owned Small Business utilization has been rising but has not yet reached the goal of 5 percent. HUBZone utilization has remained a point below the goal of 3 percent.

Figure 4-8. Prime-Contracting Small-Business Subcategory Utilization Trends: Goals and Actuals (FY 2001–FY 2015)

NOTE: Open symbols indicate that the subcategory goal for that FY was not achieved. Closed green symbols indicate that the subcategory goal was achieved for that year. Small Disadvantaged Business awards include 8(a) awards.

597 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING



AUDITING RESPONSIVENESS AND BACKLOG REDUCTION

Finally, we review progress made in the last few years to reduce auditing backlogs and improve both the quality and timeliness of contractor audits by the Defense Contract Audit Agency (DCAA).

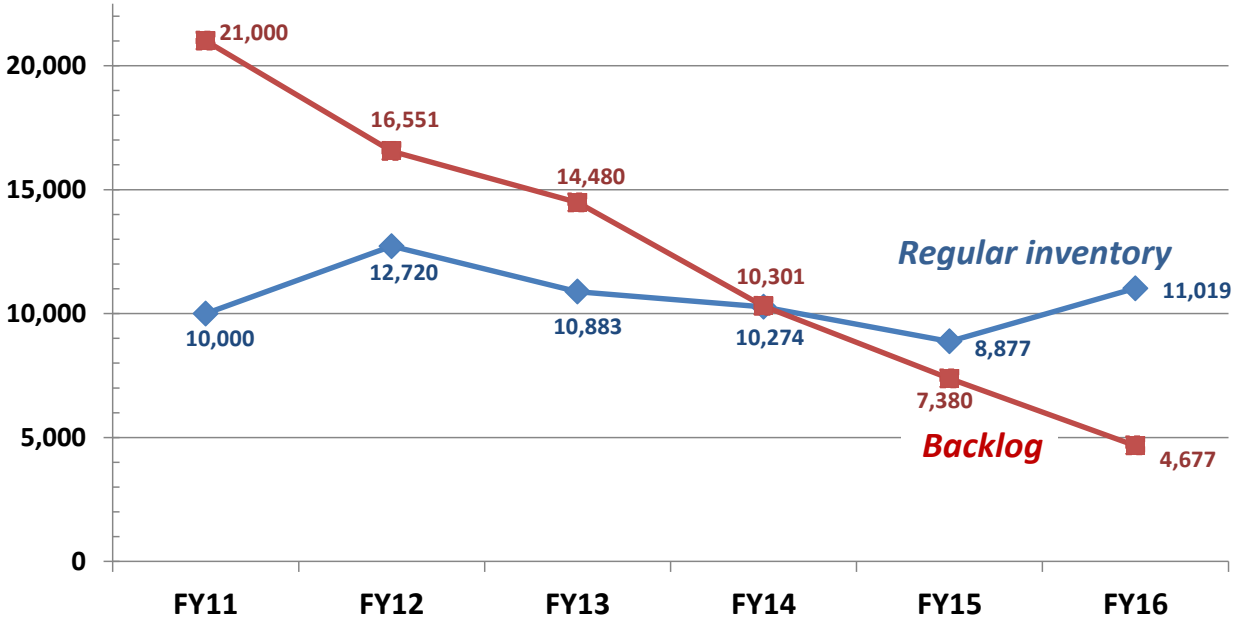
DCAA provides audit and financial advisory services to acquisition and contract administration entities in the DoD. Generally, most DCAA efforts on firm-fixed-price contracts take place during the proposal stage rather than in the incurred-cost stage. The reverse is true for cost-reimbursable contracts, wherein DCAA audits whether the costs billed by contractors are allowable so that contracts can be closed and final payments or refunds be made.

There are three main types of audits performed by DCAA. First, the *Pre-Award Survey of Prospective Contractor Accounting System* determines whether the design of the contractor's system is acceptable for the award of a cost-reimbursement contract. These audits must be completed before an award is made. The left side of Figure 4-9 shows that the median number of days to complete these audits statistically has dropped significantly from 90 days in FY 2012 to about 60 days in FY 2014–2016. DCAA was able to reduce the audit turn-around time by placing priority on these audit requests. The right side of the figure shows that our small-business contractors improved significantly the rate at which their accounting systems have been found acceptable, from about 78 percent in FY 2012 to just over 90 percent recently. These increases may be due to DCAA's outreach to the small-business community on what constitutes an acceptable accounting system.

Figure 4-9. Pre-Award Audits: Completion Time and System Acceptability Rates (FY 2012–2016)

* FY 2016 values are year-to-date as of February 2016. n = number of audits.
NOTE: Trend lines marked in red are statistically significant. Medians were used because the distributions on time to complete pre-award audits were skewed.

Second, DCAA conducts *Forward Pricing Proposal Audits* to evaluate the contractor's proposed prices, costs, and (if applicable) whether those proposed prices/costs comply with cost accounting standards. These audits assist the PM and contracting officer in negotiating a fair and reasonable contract price primarily on fixed-price contract awards. The average number of days required to complete these audits jumped from FY 2008 to FY 2011 in response to quality concerns raised by GAO (2009) while DCAA was imposing short, fixed schedules on the audits.



598 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

In response to PM concerns about the length of these audits, DCAA has since shown overall improvement in completion time. The median number of days to complete dropped from a high of 90 days in FY 2011 to about 60 days as of the third quarter of FY 2016. Also, the proportion of audits that met agreed-to target completion dates has risen from about 32 percent in FY 2012 to about 76 percent in FY 2016.

Finally, *Incurred Cost Audits* are conducted annually on cost-reimbursement contracts to determine whether the contractor's total claimed costs are allowable, allocable, and reasonable. The contract cannot be closed until these audits are completed. Depending on the results, a final payment is made to the contractor, or conversely the contractor reimburses the government for overpayments to date. Figure 4-10 shows the total number of pending audits at the end of each FY since 2011. Audits for the past two fiscal years are considered part of the "regular inventory," while audits older than two fiscal years are considered "backlogged."

Figure 4-10. Incurred-Cost Audit Inventory (FY 2011–2016)

Number of Audits to Complete

As part of DCAA strategic initiatives and in support of BBP 2.0, substantial progress has been made since 2011 on reducing the backlog of these audits. Also, the USD(C) certified on September 14, 2016 that the inventory of backlogged audits is less than 18 months. This progress likely is due to our increased emphasis on conducting multiyear (instead of single-year) audits of contractor's incurred-cost submissions and the establishment of dedicated incurred-cost audit teams starting in FY 2012.

599 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

A. Overview of Better Buying Power

BBP seeks to obtain greater efficiency and productivity in defense spending through leadership emphasis on cost control, streamlined processes, reduced bureaucracy, productivity, innovation, competition, the acquisition of contracted services, and workforce capabilities.

There are three full iterations of BBP to date. Table A-1 lists the initiatives for the first iteration (USD(AT&L), 2010) grouped into five focus areas. The goal is to improve acquisition by improving efficiency and productivity—doing more without more. Specific initiatives emphasized acquisition fundamentals while implementing proven lessons and best practices.

The second iteration of BBP (USD(AT&L), 2013a) added an emphasis on improving the acquisition workforce. Table A-2 lists the seven areas and underlying initiatives for BBP 2.0.

Finally, the third iteration of BBP (USD(AT&L), 2015d) continues prior focus areas while strengthening our emphasis on innovation, technical excellence, and the quality of our products. Table A-3 lists the areas and initiatives for BBP 3.0.

Guiding Principles of Better Buying Power

Throughout its initiatives, BBP reinforces the principles of defense acquisition (Kendall, 2016a):

People matter most; we can never be too professional or too competent.

Continuous improvement will be more effective than radical change.

Data should drive policy.

Critical thinking is necessary for success; fixed rules are too constraining.

Controlling life-cycle cost is one of our jobs; staying on budget isn't enough.

Incentives work—we get what we reward.

Competition and the threat of competition are the most effective incentives.

Defense acquisition is a team sport.

Our technological superiority is at risk and we must respond.

We should have the courage to challenge bad policy.

600 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

Table A-1. BBP Initiatives, Version 1.0

Target Affordability and Control Cost Growth

- Mandate affordability as a requirement
  - — At MS A: set affordability target as a Key Performance Parameter
  - — At MS B: establish engineering trades showing how each key design feature affects the target cost
- Drive productivity growth through Will-Cost / Should-Cost management
- Eliminate redundancy within warfighter portfolios
- Make production rates economical and hold them stable
- Set shorter program timelines and manage to them

Incentivize Productivity & Innovation in Industry

- Reward contractors for successful supply-chain and indirect-expense management
- Increase use of fixed-price incentive firm (FPIF) contract type, where appropriate, using a 50/50 share line and 120 percent ceiling as a point of departure
- Adjust progress payments to incentivize performance
- Extend the Navy's Superior-Supplier Incentive Program to a DoD-wide pilot
- Reinvigorate industry's independent research and development and protect the defense technology base

Promote Real Competition

- Present a competitive strategy at each program milestone
- Remove obstacles to competition
  - — Require open-systems architectures and set rules for acquisition of technical data rights
- Increase dynamic small-business role in defense marketplace competition

Improve Tradecraft in Acquisition of Services

- Create a senior manager for acquisition of services in each DoD Component, following the Air Force's example
- Adopt uniform taxonomy for different types of services
- Address causes of poor tradecraft in services acquisition
  - — Assist users of services to define requirements and prevent creep via requirements templates
  - — Enhance competition by requiring more frequent re-competes of knowledge-based services
  - — "1-bid"proposals: require pricing and cost data, as appropriate; re-advertise if solicitations were open to industry for less than 30 days
  - — Limit the use of time-and-materials and award-fee contracts for services
  - — Require services contracts exceeding $1 billion to contain cost efficiency objectives
- Increase small-business participation in providing services

Reduce Non-Productive Processes and Bureaucracy

- Assess all internal reviews to ensure that they focus their purpose on the major acquisition investment decisions
- Review all DoD Component-required acquisition documents for redundancy with OSD-required documents and eliminate redundant documents and non-value-added content. Ensure that such documents are focused on content needed to make DoD Component-level decisions
- Assess the value of all internally-generated reporting requirements with a goal to eliminating at least 50 percent of the reports and substantially shorten the ones remaining. Assign reasonable page-count caps (based upon the nature of the information requested) when you assign lead responsibility for report production

601 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

Table A-2. BBP Initiatives, Version 2.0

Achieve Affordable Programs

- Mandate affordability as a requirement
- Institute a system of investment planning to derive affordability caps
- Enforce affordability caps

Control Costs Throughout the Product Life Cycle

- Implement "should cost" based management
- Eliminate redundancy within warfighter portfolios
- Institute a system to measure the cost performance of programs and institutions and to assess the effectiveness of acquisition policies
- Build stronger partnerships with the requirements community to control costs
- Increase the incorporation of defense exportability features in initial designs

Incentivize Productivity & Innovation in Industry and Government

- Align profitability more tightly with DoD goals
- Employ appropriate contract types
- Increase use of fixed-price incentive contracts in Low Rate Initial Production
- Better define value in "best value" competitions
- Only use LPTA when able to clearly define Technical Acceptability
- Institute a superior supplier incentive program
- Increase effective use of Performance-Based Logistics
- Reduce backlog of DCAA audits without compromising effectiveness
- Expand programs to leverage industry's IR&D

Eliminate Unproductive Processes and Bureaucracy

- Reduce frequency of higher headquarters level reviews
- Re-emphasize AE, PEO and PM responsibility, authority, and accountability
- Reduce cycle times while ensuring sound investment decisions

Promote Effective Competition

- Emphasize competition strategies and creating and maintaining competitive environments
- Enforce open system architectures and effectively manage technical data rights
- Increase small business roles and opportunities
- Use the Technology Development phase for true risk reduction

Improve Tradecraft in Acquisition of Services

- Assign senior managers for acquisition of services
- Adopt uniform services market segmentation
- Improve requirements definition/prevent requirements creep
- Increase small business participation, including through more effective use of market research
- Strengthen contract management outside the normal acquisition chain—installations, etc.
- Expand use of requirements review boards and tripwires

Improve the Professionalism of the Total Acquisition Workforce

- Establish higher standards for key leadership positions
- Establish stronger professional qualification requirements for all acquisition specialties
- Increase the recognition of excellence in acquisition management
- Continue to increase the cost consciousness of the acquisition workforce—change the culture

602 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

Table A-3. BBP Initiatives, Version 3.0

Achieve Affordable Programs

- Continue to set and enforce affordability caps

Achieve Dominant Capabilities While Controlling Lifecycle Costs

- Strengthen and expand "should cost" based cost management
- Anticipate and plan for responsive and emerging threats by building stronger partnerships of acquisition, intelligence and requirements communities
- Institutionalize stronger DoD level Long Range R&D Program Plans
- Strengthen cybersecurity throughout the product life cycle

Incentivize Productivity in Industry and Government

- Align profitability more tightly with DoD goals
- Employ appropriate contract types, but increase the use of incentive-type contracts
- Expand the superior supplier incentive program
- Ensure effective use of Performance-Based Logistics
- Remove barriers to commercial technology utilization
- Improve the return on investment in DoD laboratories
- Increase the productivity of corporate Independent Research and Development Expand programs to leverage industry's IR&D

Incentivize Innovation in Industry and Government

- Increase the use of prototyping and experimentation
- Emphasize technology insertion and refresh in program planning
- Use Modular Open Systems Architecture to stimulate innovation
- Increase the return on and access to small business research and development
- Provide draft technical requirements to industry early and involve industry in funded concept definition
- Provide clear and objective "best value" definitions to industry

Eliminate Unproductive Processes and Bureaucracy

- Emphasize acquisition chain of command responsibility, authority and accountability
- Reduce cycle times while ensuring sound investments
- Streamline documentation requirements and staff reviews
- Remove unproductive requirements imposed on industry

Promote Effective Competition

- Create and maintain competitive environments
- Improve DoD outreach for technology and products from global markets
- Increase small business participation, including more effective use of market research

Improve Tradecraft in Acquisition of Services

- Strengthen contract management outside the normal acquisition chain—installations, etc.
- Improve requirements definition for services
- Improve the effectiveness and productivity of contracted engineering and technical services

Improve the Professionalism of the Total Acquisition Workforce

- Establish higher standards for key leadership positions
- Establish stronger professional qualification requirements for all acquisition specialties
- Strengthen organic engineering capabilities
- Ensure development program leadership is technically qualified to manage R&D activities
- Improve our leaders' ability to understand and mitigate technical risk
- Increase DoD support for STEM education

603 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

B. Analytic Details: Annual Growth of Contract Costs and Schedule for Major Programs in Development and Early Production

We analyzed growth in contract cost using summary EV data on 1,123 major contracts from FY 1981 to 2015 for 239 MDAPs. These included the combined results from 9,680 EMD reports and 8,790 early production reports. Table B-1 lists the actual 5-year moving average of annual growth of EV contract costs as calculated using the equations below.

Table B-1. Five-Year Moving Average of Annual Growth of EV Contract Costs (FY 1985–2015)

FY	Growth (actual)	FY	Growth (actual)
1985	5.47%	2001	6.67%
1986	8.89%	2002	6.56%
1987	9.84%	2003	6.82%
1988	9.33%	2004	7.06%
1989	8.00%	2005	8.55%
1990	8.07%	2006	7.98%
1991	5.99%	2007	7.07%
1992	5.65%	2008	8.66%
1993	6.02%	2009	8.16%
1994	6.07%	2010	7.48%
1995	5.93%	2011	9.10%
1996	5.07%	2012	8.21%
1997	6.20%	2013	6.05%
1998	6.14%	2014	5.27%
1999	6.75%	2015	3.49%
2000	6.12%		

NOTE: Results reflect 18,470 earned-value reports on 1,123 major contracts for 239 major defense programs.

These growths are calculated across all contracts together by totaling the changes of the PM's estimate at completion (PM EAC) in the year (i.e., from the last report from the prior year) for all contracts, then dividing by the sum of all the initial contract cost targets for all the active contracts in a year:

$$g(t) = \frac{\sum_{r=1}^{m} \Delta PMEAC_r(t)}{\sum_{i=1}^{n} CBB_i(original)}$$

for *m* reports on *n* contracts active in year *t*

604 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

where:

$g(t)$ is the average growth of contracted costs across all active EV contracts in year *t* (adjusted for inflation),

$\Delta PMEAC_r(t)$ is the change in contract cost as reported by the PMEAC for EV report *r* for an active program in year *t*, after adjusting for inflation,

$CBB_i(original)$ is the original negotiated cost target[48] at contract award for contract *i* in common base-year dollars, and

t is the fiscal year for the annual growth.

Given g_t, the 5-year moving average growth G_t of EV contract costs for year *t* is simply:

$$G_t = \frac{\sum_{i=0}^{4} g(t-i)}{5}$$

for $t \in [FY1985, FY2015]$.

Model of Annual Growth of Contract Costs

The following equations show our statistical model of the 5-year moving average of annual growth of EV contract costs on major MDAP contracts:

$$G_t = c_0 + c_1 B_{t-1} + c_2 \Delta B_t + c_3 GN_t + c_4 BBP_t + u_t$$
$$u_t = c_5 u_{t-5} + \varepsilon$$
$$\varepsilon \sim i.i.d.\ N(0, \sigma^2)$$

for $t \in [FY1985, FY2015]$.

where:

G_t is the 5-year moving average of annual growth of EV contract costs at time *t*,

c_i are coefficient constants,

B_{t-1} is the 5-year average of the DoD budgets from time *t-5* to time *t-1*,

$\Delta B_t = B_t - B_{t-1}$ is the change in the 5-year moving average of the budget from time *t-1* to time *t*,

$GN_t = \begin{cases} 1 \text{ for } t \geq FY1990, \\ 0 \text{ for } t < FY1990; \end{cases}$ *this is the indicator variable for a hypothesized structural change since FY 1990 (i.e., the era of full implementation of the Goldwater-Nichols Act),*

$BBP_t = \begin{cases} 1 \text{ for } t \geq FY2012, \\ 0 \text{ for } t < FY2012; \end{cases}$ *this is the indicator variable for a hypothesized structural change since FY 2012 (i.e., the era of full implementation of BBP),*

u_t is an autoregressive factor for the difference between the actual growth and the growth predicted by the other factors 5 years earlier, and

ε is a series of independent and identically distributed (*i.i.d.*) samples from a normal distribution with zero mean (i.e., Gaussian white noise).

[48] In EV reports, the CBB is the sum of the Negotiated Contract Cost (NCC) and the Authorized Unpriced Work (AUW).

605 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

Table B-2 lists the coefficients c_i for the statistically significant factors in the model of the 5-year moving average of annual growth of EV contract costs on major MDAP contracts reporting EV. Figure B-1 shows the partial contributions of these drivers to the growth curve for each year from FY 1985 to FY 2015, and Figure B-2 shows the combined effect of the two budgetary variables. Recall that Figure 3-2 shows how closely this statistical model matches the actual growth in EV contract costs over this period; it uses the MLE coefficients.

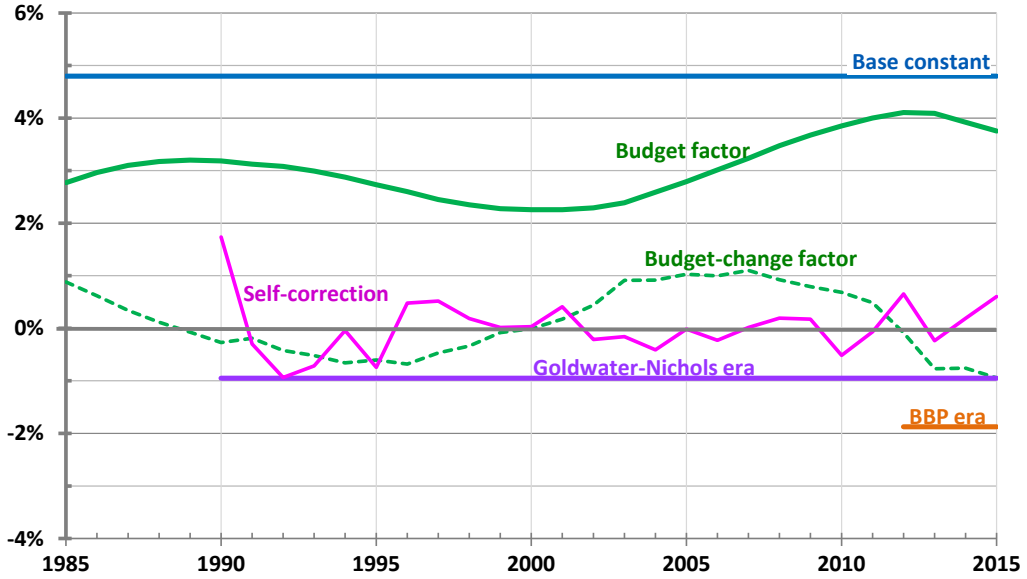


Table B-2. Model Coefficients and Statistics: 5-Year Moving Average of Annual Growth of EV contract costs

Driver Type	Factor	OLS (Newey West)	MLE (OIM)	MLE (OPG)	p-value OLS	p-value MLE (OIM)	p-value MLE (OPG)
Budget Effects	c_1 coefficient for each $100B in the 5-year moving average of prior DoD TOAs from last year *(standard error)*	0.602% *(0.0000195)*	0.551% *(0.0000197)*	0.551% *(0.0000319)*	0.005***	0.005***	0.084*
	c_2 coefficient for each $10B change in 5-year moving average of prior DoD TOAs from last year *(standard error)*	0.233% *(0.0000788)*	0.252% *(0.0000587)*	0.252% *(0.0000729)*	0.007***	0.000***	0.001***

Figure B-1. Factors Contributing to 5-year Moving Average of Annual Growth of EV contract costs (FY 1985–2015)

Factor	Partial Contributions (MLE model)
Base constant (overall)	4.8 %-points
Average budget over prior 5 years	+ 0.55 %-points per $100B
Change in 5-year average of past budgets from the prior year to current year	+ 0.25 %-points per $10B change
Post-Goldwater-Nichols-era structural change (since FY 1990)	− 0.95 %-points
BBP-era structural change (since FY 2012)	− 1.9 %-points
Self-correction factor of difference between actuals and the other factors 5 years ago	− 0.58 times the overage 5 years ago
Randomness	+ pure noise

607 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

Figure B-2. Factors Contributing to 5-year Moving Average of Annual Growth of EV contract costs: Combined Budgetary Factors (FY 1985–2015)

In simple terms, this model (not surprisingly) indicates that the defense acquisition system modulates changes to major program contracts—in part—based on budgets: if there are more resources, then the system addresses more issues such as threats and engineering issues that arise in development and early production. When resources are tight, the system addresses fewer of these problems. The combined partial effect is that growth changes somewhat in the same direction that budgets change (i.e., they are procyclical), which can be seen visually in Figure B-2. Cost change is expected to increase just over half a percentage point for every $100 billion in average budget over the prior 5 years. The model also predicts that cost changes will increase about a quarter of a percentage point for every $10 billion change in the 5-year moving average of past budgets from last year to the current year.

Also, there have been additional behavioral shifts to partially reduce growth on major contracts: one coincident with the implementation of Goldwater-Nichols to present, and one coincident with BBP implementation to present. These effects are large, statistically significant, and independent of budgetary dynamics. In the Goldwater-Nichols era, growth has been systemically moderated by about 1 percentage point, and growth has been reduced almost another 2 percentage points in the BBP era (all other things being equal). Measured against the peak annual growth of almost 10 percent in this period, these reductions constitute a systemic reduction of almost a third.

608 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

In addition, the DoD self-corrects for external and internal variations that ensure stability. If contract work grew in a year more than what we would expect from the model-given budgetary trends, existing structural behaviors (say, because of critical threats), and prior corrections, then the DoD cuts back in the future. Conversely, if contract work grew less than expected, then the DoD tends to increase obligations in the following year to address problems. In other words, it shows that the defense acquisition system self-corrects for differences between what it anticipates it can obligate on contracts, given recent budgetary effects under the then-current structural climates, and what it actually put on existing contracts. In addition to external and random shocks, this factor may reflect a so-called "horsetail" effect, wherein the DoD's 5-year FYDP usually fails to predict both downward and upward cyclic changes in actual budgets (i.e., being overly optimistic when budgets are declining and pessimistic when budgets are rising—see, for example, Lambert, 2014, p. 3, and Harrison, 2014, p. 21).

Lastly, there is a constant base of growth on contracts over all these years, reflecting that defense weapon system development and early production involves some remaining uncertainties, risks, and investments (including changes to keep up with evolving threats). The overall base of just under 5 percent annually, however, is relatively low, given these are the more risky development and early production contracts, not full-rate production.

Model of Annual Contract Schedule Growth

Statistically we found that schedule growth has been on a simple downward trend along with its own 1-year self-correction factor (Table B-3).

Below are the statistically significant factors in the model of the 5-year moving average of annual growth of contract schedules on major MDAP contracts reporting EV.

$$s_t = c_0 + c_1 Y_t + u_t$$
$$u_t = c_2 u_{t-1} + \varepsilon$$
$$\varepsilon \sim i.i.d.\ N(0, \sigma^2)$$
$$\text{for } t \in [FY1985, FY2015]$$

where:

- s_t is the 5-year moving average of annual schedule growth for active major MDAP contracts in year t,
- c_i are coefficient constants,
- Y_t is the variable of time (i.e., the model is a secular time trend),
- u_t is an autoregressive factor for the difference in the prior year between the actual schedule growth and the growth predicted by the other factors, and
- ε is a series of independent and identically distributed (*i.i.d.*) samples from a normal distribution with zero mean (i.e., Gaussian white noise).

609 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

Table B-3 lists the coefficients c_i for the statistically significant factors in the model of the 5-year moving average of annual schedule growth on major MDAP contracts reporting EV.

Table B-3. Model Coefficients and Statistics: 5-Year Moving Average of Annual Growth of Contract Schedules

Driver Type	Factor	MLE (OPG)	p-value MLE (OPG)
Linear declining trend	Coefficient for time trend (per year) (standard error)	−0.157%/year (0.000651)	0.014**
Self-Corrections	Autocorrelation coefficient: correction amount of actual-to-model difference in prior year (standard error)	0.766 (0.154)	0.000***
Base	Coefficient for constant (standard error)	3.21 (1.30)	0.016**

** statistically significant at the 5% level of significance

*** statistically significant at the 1% level of significance

NOTES: Annual 5-year moving average of schedule growth for executing contracts for major programs has a negative secular time trend over the last 31 years (i.e., schedule growth is declining). Each year's growth is the sum of all the changes in active contract schedules divided by the sum of all the original schedules. Thus, the portfolio percentage change will be closer in value to the percentage change of the longer contracts (similarly to how the growth in EV contract costs is affected by larger programs). The autocorrelation coefficient met stability conditions. After accounting for autocorrelation, the residual error was white noise.

For this model we employed ordinary least squares (OLS) and maximum likelihood estimation (MLE) estimation methods. For calculating the correct variance-covariance matrix we employed three different methods: Newey-West, observed information matrix (OIM), and sum of outer product of gradient vectors (OPG). The autocorrelation coefficient met stability conditions, and the residual error after accounting for autocorrelation was white noise.

611 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

C. Analytic Details: Total Growth of MDAP Contract Costs Aligned to Milestone B

We analyzed the same EV data discussed in Appendix A above in the annual growth study. These data used summary EV data on 1,123 major contracts from FY 1981 to 2015 for 239 MDAPs. These included the combined results from 9,680 EMD reports and 8,790 early production reports. Table C-1 lists the actual 5-year moving average of total growth of EV contract costs aligned to MS B as calculated using the equations below.

These results are robust to different estimation methods and different ways of calculating the variance-covariance matrix. The autocorrelation coefficients met stability conditions. The residual error after accounting for autocorrelations was white noise.

Table C-1. Five-Year Moving Average of Total Growth of MDAP Contracted Costs Aligned to MS B Date (FY 1985–2012)

FY	Growth (actual)		FY	Growth (actual)
1985	36.3%		1999	63.8%
1986	35.5%		2000	63.9%
1987	50.3%		2001	72.6%
1988	58.9%		2002	54.0%
1989	84.2%		2003	52.4%
1990	77.1%		2004	47.4%
1991	73.0%		2005	47.2%
1992	58.7%		2006	40.5%
1993	66.0%		2007	36.5%
1994	40.1%		2008	46.1%
1995	37.7%		2009	42.8%
1996	38.1%		2010	46.3%
1997	61.5%		2011	44.8%
1998	51.1%		2012	42.8%

NOTE: Results reflect 18,470 earned-value reports on 1,123 major contracts for 239 major defense programs, including work-content growth (which dominates EV cost growth generally) and cost-over-target (i.e., overruns relative to the contract target). Because these are five-year moving averages, the values for 1985–1988 include data before 1985. Also, there was no MS B date after 2012 for the MDAPS that these contracts supported, but the dates up to 2012 include cost data through 2015.

These growths are calculated across all contracts together by totaling for each year the latest changes of the PM EAC for all contracts for the MDAP that had an MS B in that year, then dividing by the sum of all the initial contract cost targets for those contracts:

$$g(t) = \frac{\sum_{r=1}^{m} \Delta PMEAC_r(t)}{\sum_{i=1}^{n} CBB_i(original)}$$

for *m* reports on *n* contracts for MDAPs that passed MS B in year *t*

612 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

where:

$g(t)$ is the total growth (adjusted for inflation) of contracted costs across all active EV contracts for MDAPs with MS B in year *t*,

$\Delta PMEAC_r(t)$ is the change in contract cost as reported by the PMEAC for EV report *r* for all contracts for MDAPs with MS B in year *t*, after adjusting for inflation,

$CBB_i(original)$ is the original negotiated cost target[49] at contract award for contract *i* in common base-year dollars, and

t is the fiscal year in which the MDAPs passed MS B.

Given g_t, the 5-year moving average growth G_t of EV contract costs for year *t* is simply:

$$G_t = \frac{\sum_{i=0}^{4} g(t-i)}{5}$$

for $t \in [FY1985, FY2012]$.

Model of Total Growth of Contract Costs Aligned to MDAP MS B Date

The following equations show our statistical model of the 5-year moving average of annual growth of EV contract costs on major MDAP contracts:

$$G_t = c_0 + c_2 \Delta B_t + u_t$$
$$u_t = c_1 u_{t-1} + c_4 u_{t-4} + c_5 u_{t-5} + \varepsilon$$
$$\varepsilon \sim i.i.d.\ N(0, \sigma^2)$$

for $t \in [FY1985, FY2012]$.

where

G_t is the 5-year moving average of annual growth of EV contract costs at time *t*,

c_i are coefficient constants,

$\Delta B_t = B_t - B_{t-1}$ is the change in the 5-year moving average of the budget from time *t-1* to time *t*,

u_t is an autoregressive factor for the difference between the actual growth and the growth predicted by the other factors 1, 4, and 5 years earlier, and

ε is a series of independent and identically distributed (*i.i.d.*) samples from a normal distribution with zero mean (i.e., Gaussian white noise).

[49] In EV reports, the CBB is the sum of the Negotiated Contract Cost (NCC) and the Authorized Unpriced Work (AUW).

615 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

D. Analytic Details: Correlates of O&S Cost Estimates

To model the correlates of O&S cost estimates, we examined the SARs from CY 2001 to 2014 (FY 2002–2015) and identified 161 MDAPs that provide O&S cost estimates. We then used multivariate regression to test a range of variables for correlation with the changes over time in O&S cost estimates during acquisition. The following proxy variables were used for wages, fuel prices, and health-care costs:

- Annual average wage per worker (from Social Security Administration)
- Fuel prices (price of a barrel of crude) (from Energy Information Administration)
- Personal health consumption (from Centers for Medicaid/Medicare Services)

All data was adjusted for inflation by converting 2016-dollars using Comptroller's Green Book (USD(C), 2016c). There were no O&S estimates in the Defense Acquisition Management Information Retrieval system before December 2001.

Defense-Wide

The following equation shows our statistical model of growth on O&S cost estimates across all MDAPs in the sample:

$$y_t = c_0 + c_1 x_{1t} + c_2 w_{t-2} + c_3 wg_{t-3} + c_4 hcg_{t-5} + c_5 fp_{t-5} + \varepsilon_t$$

$$\varepsilon_t \sim i.i.d.\ N(0, \sigma^2) \text{ (i.e., white noise)}$$

$$\text{for } t \in [FY2002, FY2015].$$

where:

y_t is the real annual change in O&S cost estimates for the MDAPs reporting in year t,
c_i are coefficient constants,
x_{1t} is the annual change in the portfolio maintenance estimate,
w_{t-2} is the annual average wage per worker, lagged 2 years,
wg_{t-3} is annual year-on-year change in the annual median wage per worker, lagged 3 years,
hcg_{t-5} is the annual year-on-year change in the annual per capita health care consumption, lagged 5 years.
fp_{t-5} is the annual average price of a barrel of crude, lagged 5 years, and
ε is a series of independent and identically distributed (*i.i.d.*) samples from a normal distribution with zero mean (i.e., Gaussian white noise).

Table D-1 lists the coefficients c_i for the statistically significant factors in the model of the annual change in O&S cost estimates. Recall that Figure 3-9 on p. 96 shows how closely this statistical model matches the actual growth in annual O&S cost estimates over this period.

* statistically significant at the 10% level of significance.
** statistically significant at the 5% level of significance
*** statistically significant at the 1% level of significance.

NOTES: n = 161 MDAPs. R-squared = 81 percent. The p-value for the model is 0.0000***. The residual error was white noise.

The Ramsey regression equation specification error test (RESET) indicates there are no omitted variables in this model. The Breusch-Pagan/Cook-Weisberg test indicates the errors have a constant variance. The Shapiro-Wilk and the skewness/kurtosis tests both indicate the error term is distributed normal. The sample of residuals, used to estimate the error term, has a sample mean of 0.00 and a constant variance of 0.0397. The variable inflation factor test suggests that multicollinearity among the independent variables is not a problem. Spearman's test for correlation indicates that all the independent variables are mutually independent (at the 5% level of significance). The linktest indicates the model is properly specified. Both the Portmanteau and Bartlett tests indicate the error term is white noise.

A similar approach was used in our analysis of correlates for MDAPs by Commodity (Army, Navy, Air Force, and other DoD) and commodities.

E. Further Statistical Analysis Details

Generally, statistical analyses conducted for this report involved both parametric and nonparametric tests, as discussed below.

Supporting Sample Analysis for Regressions

In our linear multivariate regression analyses, we conducted supporting sample analysis tests for normality of residuals (Smirnov-Kolmogorov and Shapiro-Wilk tests), heteroskedasticity (Cook-Weisberg test), multicollinearity (variance inflation factor test), omitted variables (Ramsey RESET), and correct model specification (linktest). We also used bootstrap simulations to obtain unbiased coefficient estimates, correct standard errors, and correct confidence intervals.

Single Variable Analysis Tests

Single variable analyses allowed us to focus on differences by a single factor (e.g., phase, contract type, cost or price growth, schedule growth, or final margin). Nonparametric tests (Wilcoxon rank-sum and Kolmogorov-Smirnov) were used to test for statistical significance between populations, and the median was used as the measure of central tendency because the distributions were skewed. The chi-squared test was used to determine statistical significance for categorical variables.

Interpreting Box-and-Whisker Diagrams and Percentile Plots

Throughout this report, the so-called "box and whisker" charts (described in Figure E-1) help visualize the distribution of a particular variable. The gray boxes show the second and third quartiles (i.e., the 25th to the 50th percentile, and the 50th to the 75th percentile). The minimum and maximum are shown with a small bar at the end of the vertical line (or may run off the chart in some instances). The median (50th percentile, where half of the occurrences are above it and half below) is the *best measure of central tendency* in the data because the distributions are skewed. Note that the quartiles do not convey the actual distributions within the quartiles. As seen by the illustrations on the left of the figure, these distributions can be "lumpy" or nonuniform, but the charts do provide a quick visual for comparing two distributions. The charts also convey a sense of how much of the distribution is, say, negative or larger than a value of interest.

Next to some box-and-whisker charts we show the actual distributions so that we can see the distributions within each quartile. Figure E-2 shows how these percentile charts compare to the

618 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

box-and-whisker charts, providing not only the quartiles but the whole distribution for each percentage. In this case, we show the box-and-whisker for the black line.

G. Abbreviations

(See also the program names defined starting on p. 159)

ACAT—Acquisition Category

APB—Acquisition Program Baseline

APUC—Average Procurement Unit Cost

AT&L—Acquisition, Technology, and Logistics

BA—budget activity

BBP—Better Buying Power

BLRIP—beyond low-rate initial production

BY—base year

C4ISR—Command, Control, Communications, Computers, Intelligence, Surveillance, and Reconnaissance

CBB—Contract Budget Base

COTS—Commercial Off the Shelf

CPARS—Contractor Performance Assessment Reporting System

CY—calendar year

DAE—Defense Acquisition Executive

DAWDF—Defense Acquisition Workforce Development Fund

DCAA—Defense Contract Audit Agency

DHA—Defense Health Agency

DLA—Defense Logistics Agency

DoD—Department of Defense

DoDI—Department of Defense Instruction

DOT&E—Director, Operational Test and Evaluation

DPARCA—Director, Performance Assessments and Root Cause Analyses

EAC—estimate at completion

EMD—Engineering, Manufacturing and Development

EV—earned value

FAR—Federal Acquisition Regulation

FDD—Full-Deployment Decision

FFO—(date) funds first obligated

FPDS-NG—Federal Procurement Data System-Next Generation

FPIF—fixed-price incentive firm

FY—fiscal year

FYDP—Future-Years Defense Program

GAO—Government Accountability Office

HUBZone—Historically Underutilized Business Zone

IOC—Initial Operational Capability

IPT—integrated product team

IQR—interquartile range

IR&D—Independent Research & Development

IT—information technology

JCIDS—Joint Capabilities Integration and Development System

KSA—Key System Attributes

KPP—Key Performance Parameter

LFT&E— Live-Fire Test and Evaluation

LRIP—Low-Rate Initial Production

624 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

MAIS—Major Automated Information Systems

MAR—MAIS Annual Report

MDA—Milestone Decision Authority

MDAP—Major Defense Acquisition Program

MDD—Materiel Development Decision

MOE—MAR original estimate

MPS—Mission Planning System

MS—Milestone

NDAA—National Defense Authorization Act

O&M—Operations and Maintenance

O&S—Operating and Support

OCO—Overseas Contingency Operations

OSD—Office of the Secretary of Defense

OT&E—operational test and evaluation

PARCA—Performance Assessments and Root Cause Analyses

PAUC—Program Acquisition Unit Cost

PB—President's budget (request)

PBL—performance-based logistics

PEO—Program Executive Officer

PM—program manager

PM EAC—Program manager's estimate at completion

PSC—product service code

Q—quarter

R&D—research and development

RDT&E—Research Development Test and Evaluation

RESET—Ramsey regression equation specification error test

SAE—Service Acquisition Executive

SAIC—Science Applications International Corp.

SAR—Selected Acquisition Report

SSIP—Superior Supplier Incentive Program

TMRR—Technology Maturation and Risk Reduction

Abstract

Army Aviation's Pacific Rebalance: Evolution towards Maritime Operations, by MAJ John M. McLean II, US Army, 59 pages.

US Army Aviation provides essential movement capabilities to maneuver and joint force commanders. Transitioning from exclusively land-based operations to potential maritime operations in the US Pacific command area of responsibility, Army Aviation faces increased demands to overcome geographical complexities to support joint operations. This monograph examines historical maritime operations where Army Aviation's maritime applications provided commanders with increased options to achieve mission success. Army Aviation operations in the maritime domain pose unique challenges which require innovative adaptations of doctrine, organization, and training to overcome these operational challenges. Through continued doctrinal development and joint, multinational training exercises Army Aviation can augment existing maritime capabilities to increase the US military's operational capacity in the US Pacific command area of responsibility.

Introduction

> The strength of any Joint Force has always been the combining of unique Service capabilities into a coherent operational whole.
>
> —General Martin Dempsey, *Capstone Concept for Joint Operations*, 2012

In 2011, the United States government introduced the "Pivot to the Pacific" to rebalance its strategic focus following a decade of emphasis on the Middle East and Southwest Asia.[1] To do so, the United States intends to rebalance its diplomatic, economic, and military focus toward increased emphasis on Asia-Pacific regional threats and opportunities.[2] Militarily, the Pacific region's maritime-dominated environment requires reprioritization from the land-based competence earned in Iraq and Afghanistan.[3] The US Pacific Command's (USPACOM) expansive Area of Responsibility (AOR) ranges from dispersed islands to densely populated urban centers.[4] For United States Army Aviation, the Pacific rebalance requires a broadened approach to its core competencies to increase its interoperability between land and maritime environments. US Army Aviation proved its integral capability to project power throughout a land-based operational environment. To match this capability in the US Pacific Command's maritime area of responsibility, US Army Aviation must evolve to maintain its ability to support joint maneuver forces in maritime dominated environments.

644 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

Operations Iraqi and Enduring Freedom's land-based theaters allowed combat aviation brigades (CABs) to maximize Army rotary wing capabilities via central location.[5] This placement enabled commanders' to project combat forces throughout the depth of the operational environment and maximize centralized support. In future operations, the USPACOM AOR's dispersion will likely impede centralized aviation support in maritime-dominated operational environments.[6] To overcome geographic impediments, the Army develop "innovative and collaborative" approaches to its doctrine, training, and ability to organize to fulfill its core competencies in support the US Pacific Command area of responsibility.[7]

US Army Aviation must evolve to remain viable in the USPACOM AOR. To identify Army Aviation's necessary changes, this monograph asks: What adaptation of the US Army's rotary wing aviation capabilities will lead to successful employment in the maritime regions of the US Pacific Command area of responsibility?[8] A critical consideration for this research question is the fact that the Army Aviation will not abandon its land-based proficiencies to increase maritime competency. Instead, Army Aviation must expand existing capabilities to enhance maritime application.

Fiscal constraints and general practicality limit this monograph's recommendations, which allows for near-term implementation. From an organization perspective, the combat aviation brigade remains the primary tactical aviation organization. Recommended organizational

[8] Army Aviation includes both rotary wing, fixed wing, and unmanned airframes. For the purpose of this monograph, the term "Army Aviation" will focus on its rotary wing airframes assigned to combat aviation brigades unless otherwise specified.

645 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

changes are limited to internal arrangement of current CAB compositions. Existing aircraft remain the baseline to recommend improvements to doctrine, organization, and materiel.[9] This monograph's recommendations remain economically feasible and implementable within three years by excluding new aircraft acquisition and CAB re-organization.

Consistent with the current Army Operating Concept, Army Aviation's incorporation into joint and multinational maritime operations increases the Army's operability across land and maritime domains, in support of joint and multinational partners.[10] Increased Army maritime capabilities will augment, not supersede, Marine Air-Ground Task Force (MAGTF) capabilities. As fiscal constraints limit the amount of US Marine Corps and US Navy assets, Army Aviation will fulfill supplementary roles to ensure operational commanders can tailor available assets toward the appropriate operational requirements.

This monograph focuses specifically on Army Aviation's core competencies that enable the movement, sustainment, and mission command capabilities of supported maneuver forces.[11] These competencies require the most difficult effort to integrate with joint and multinational operations and exemplify the operations Army Aviation is most likely to execute as opposed to a standing MAGTF. These competencies focus the case studies and recommendations on utility and cargo helicopter operations. Lastly, proposed recommendations consider all levels of war. In a

[9] This monograph assumes no change to the ongoing OH-58D divestment plan. During this transition, AH-64D/Es and RQ-7 equipped Heavy Armed Reconnaissance Squadrons replace OH-58D equipped Armed Reconnaissance Squadrons.

[10] Training and Doctrine Command Pamphlet (TRADOC PAM) 525-3-1, *The US Army Operating Concept: Win in a Complex World 2020-2040* (Washington, DC: Government Printing Office, 2014), 7-10.

[11] Field Manual 3-04, *Army Aviation* (Washington, DC: Government Printing Office, 2015), 1-1 – 1-5. Army Aviation is founded in seven core competencies. This monograph focuses primarily on four: air assault ground maneuver forces; air movement of personnel, equipment, and supplies; evacuate wounded or recover isolated personnel; and enable mission command over extended ranges and complex terrain.

646 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

maritime dominated operational environment, proximity to partner nations, conventional and irregular threats, and the unmatched distances that separate areas of operation from support areas provide unique and challenging military problems in the United States' strategic rebalance toward the Pacific.[12]

Modern Army Aviation is optimized for land-based application and must adapt its doctrine, organization, training, and materiel to support joint operations throughout a maritime dominated operational environment. To prepare for maritime geographical limitations, Army Aviation must be able to scale-down to task force and team echelons based vast distances between support areas and the potential for amphibious, ship-based operations. Despite the differences between continental and maritime operational environments, the Army expects rotary wing aviation to support its maneuver forces with timely and precise mobility, fires, sustainment, and intelligence. By enabling the rapid displacement and concentration of combat power throughout the operating environment, Army Aviation enables efficiency and agility in joint operations.[13] Efficiency increases enable military leaders to achieve mission objectives with less personnel or equipment. This efficiency is important given the growing attention on military expenditure and the political focus on troops strengths dedicated to contingency operations. Second, Army Aviation concentrates combat power at decisive points, in both time and space. Efficiency and concentration allow commanders to achieve relative and decisive advantages over their adversary.[14]

647 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

Rebalancing its global priorities, the United States National Command Authority directed the Department of Defense to emphasize readiness and engagement in the USPACOM AOR in future military efforts.[15] USPACOM's predominately maritime geography differentiates it from the primarily land-based focus of other geographic combatant command areas of responsibility. Extending beyond the limits of the Pacific Ocean, the USPACOM AOR also includes Australia, China, India, and nearly 80% of the Indian Ocean. Portrayed in Figure 1. US Pacific Command Area of Responsibility, this area hosts over fifty percent of the world's population, which magnifies the AOR's security considerations stemming from ethnic tensions and population density.[16]

Due to USPACOM AOR's vast size, this monograph differentiates two amphibious regions for expected Army Aviation employment. Also depicted in Figure 1. US Pacific Command Area of Responsibility, the "Continental amphibious region" denotes areas where Army Aviation will most likely operate in a traditional manner from land bases. More importantly for this monograph, the depicted "Maritime amphibious region" includes fragmented land areas where traditional operations may not be feasible. This "maritime amphibious region" provides the greatest likelihood for amphibious or ship-based operational requirements for Army Aviation.[17]

Economically, the United States' trade relations throughout the Asia-Pacific region provide credibility with its strategic Asia-Pacific partners.[18] By 2020, over half of the United States' international growth is expected to occur within the USPACOM AOR.[19] Military capabilities deter hostile action to maintain freedom of navigation in support of the United States' economic interests. A maritime-capable Army assures the United States' strategic partners in its ability to deter against adversarial aggression and economic impacts in the Asia-Pacific region.

Economic competition in the Asia-Pacific Region increases the potential for military conflict to guarantee access to resources and trade.[20] The expansion of the Army's maritime capabilities will ensure that the United States' largest military service remains a viable asset in

649 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

military operations in the USPACOM AOR. Aviation is a critical enabler for the Army; the development of amphibious aviation capabilities allows the US military to counter external influences and preserve its Asia-Pacific security and prosperity.

The Asia-Pacific region is one of the most complex global military landscapes, including seven of the world's largest militaries and five nuclear-capable nations.[21] Multilateral military partnerships are essential to strengthen the United States' regional security posture. China refutes the United States' future ability to maintain Pacific security and proposes that its People's Liberation Army assumes the primary role in Asia-Pacific security.[22] China's challenge requires increased US efforts to ensure national capabilities remain viable in the USPACOM AOR. This application of Nye's "smart power" will strengthen the United States' influence Asia-Pacific.[23] Adapting Army Aviation towards maritime capabilities provides a critical step to ensure that the United States' largest military service can conduct operations throughout the USPACOM AOR.

Army Aviation requires doctrinal and organizational adaptation to continue its joint efficiency and agility in maritime environments. This monograph examines the USPACOM AOR's unique geographic and operational requirements to determine the best opportunities for military employment. Army Aviation operations in the USPACOM AOR requires joint and multinational capabilities to improve interoperability and mission effectiveness to strengthen the United States' strategic deterrence throughout the USPACOM AOR.

This monograph uses current service doctrine and historical case studies as the lens to determine viable applications for Army Aviation in the maritime regions of the USPACOM

650 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

AOR. Service doctrine establishes the current frame of reference to establish a baseline assessment of Army Aviation's prospective capabilities. Following the capabilities assessment, three case studies provide contextual data to conduct a qualitative analysis of the potential for future Army Aviation applications in the USPACOM AOR. The current Army Aviation expectations and case studies identify the opportunities to recommend feasible modification to Army Aviation training, from unit-level drills to multinational Pacific training exercises.[24]

A cursory understanding of Army Aviation capabilities is required to anticipate future maritime requirements. An Army doctrine overview, specifically focusing on maritime, amphibious, and shipboard operations highlights existing capability and shortfalls as applied to operations in the USPACOM AOR. A similar review of US Joint and cross-service doctrine and equipment identifies existing aspects necessary to improve Army Aviation doctrine and increase maritime capability.

The first case study examines Army Aviation's ship-based execution of Operation Uphold Democracy, the 1994 operation to secure Haiti. This case examines the opportunity created by the unprecedented and innovative amphibious employment of Army rotary wing Aviation from two US Navy aircraft carriers.[25] This case exemplifies the effects of joint interoperability and planning considerations preceding operation. The scale of the operation and joint coordination complications highlight potential differences between anticipated Pacific operations and those exhibited in Operations Iraqi and Enduring Freedom.[26] Though it did not

651 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

occur in the USPACOM AOR, Operation Uphold Democracy's unprecedented air assault demonstrates the potential scale required of Army Aviation's amphibious combat power projection in a maritime environment.

The second case study, 1999's Operation Stabilise, examines a USPACOM scenario where amphibious Army Aviation employment could have led to operational success. This United Nations (UN) initiated this peacekeeping operation to safeguard an independence referendum and stop a humanitarian crisis between Indonesia and the seceding East Timor. Despite East Timor's pursuit for independence from Indonesia, Timor Island remained Indonesian sovereign territory. Vast geographical distances and geopolitical complications delayed peacekeepers until Indonesia granted its approval. Though the US military did not play a primary role in Operation Stabilise, this case's geographic and political aspects represent a likely future scenario where amphibious capabilities may afford a strategic advantage.[27] Furthermore, the multinational aspect of Operation Stabilise makes it a viable case to examine joint and multinational partner employment capabilities for amphibious Army Aviation.

The final case study examines a worst-case scenario, where ship-based Army Aviation could augment joint foreign humanitarian response operations. Operation Tomodachi examines the multinational response to Japan's destroyed nuclear power plant following a tsunami. The combined effects of the tsunami and nuclear meltdown warranted an immediate US military response. Led by a USMC Marine Expeditionary Unit (MEU), the US government led the massive foreign humanitarian assistance and disaster relief mission. Despite the mission's success, mission requirements nearly exceeded relief capability on several occasions.[28] In a future

652 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

scenario, amphibious Army Aviation could augment or relieve USMC units to increase operational capacity. Amphibious based employment alleviates the complications based upon potentially limited access. The counterpoint to Operation Stabilise's requirement for precise capabilities, operation tomodachi exemplifies the need to respond with massive operational capabilities in support response to crises in the USPACOM AOR.

The Pacific area of responsibility's vast array of population density (mega cities to desolate islands), infrastructural condition (modernity to squalor), and severe natural disasters (typhoons, earthquakes, volcanos) makes the region rife with plausible disaster scenarios. In these extreme scenarios, amphibious based or amphibiously introduced Army rotary wing operations provide an ideal augmentation to the primary, yet limited disaster response capabilities. In these case studies, rotary wing precision combined with reduced logistical requirements promote Army aviation assets as a viable option in large scale, Pacific disaster response.

The last decade's resurgence in Joint/Multinational partnership and exercises throughout the US Pacific Command area of responsibility provides the opportunities and resources required to develop Army Aviation's maritime capability. Implementing the Pacific Pathways construct, US Army Pacific Command conducts several multinational exercises to reduce training budgets and maximize training exposure with military allies and the US State Department.[29] These exercises provide the venue to incorporate Army Aviation to develop and improve Army Aviation's maritime competency in the Asia-Pacific region.[30]

653 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

Army Aviation's re-organization into specialized task forces will employ smaller, agile units, capable of providing direct support to independent Brigade Combat Teams. Scalable aviation organizations can provide tailored support to maneuver elements in areas where physical separation prohibits centralized support.[31] Aviation missions executed from non-US Navy amphibious platforms provides a multinational opportunity to maximize Army Aviation's maritime potential in the Pacific. This monograph examines the feasibility of overcoming the Pacific expanse by conducting combined, joint operations with the Australian Defence Forces and Japanese Maritime Self Defence Forces.

The combination of historical examples and contemporary applications provides the method to assess whether the recommended aviation competencies yield increased joint and multinational capability. Examination of operational expectations, joint/multinational capabilities, and mission feasibility identifies recommended changes to doctrine, organization, training, and materiel for Army Aviation to succeed in the USPACOM AOR. This monograph recommends initial changes to training and doctrine that later enable opportunities to conduct combined and joint training as the method to optimize USPACOM employment. Additionally, this approach recognizes strategic and political advantages that maximize the United States' ability to increase its influence and deter opposition in the Pacific.

Three contentions shape what the recommended capabilities Army Aviation must develop to achieve mission success in the USPACOM AOR. First, Army Aviation must retain the capability to conduct a Brigade Combat Team sized air movement/air assault into semi-permissive environments.[32] Second, Army aviation must retain the capability to sustain battalion-sized or smaller, multipurpose aviation task forces in support of a Brigade Combat Team or smaller operations in an austere environment. These mission capabilities represent the most

[31] FM 3-04, 2-13 – 2-15.

[32] Bickford et al., "The Role of the U.S. Army in Asia," 51-53.

654 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

demanding scenarios Army Aviation will likely face in the Asia-Pacific region. Third, aviation-capable amphibious platforms are limited in number and retain strategic importance; only strategically vital operations will warrant amphibious ship retask and reconfiguration to employ Army assets. These elements guide the recommendations for Army Aviation's joint capabilities in a maritime domain.

Aviation/Amphibious Capability: Doctrine, Organization, Training, and Equipment

A preliminary understanding of the applicable doctrine is required to recommend improvements for Army Aviation in the USPACOM AOR. This monograph considers applicable doctrine separated into three categories: Army service doctrine, US Joint doctrine, and US Naval doctrine. Army and Joint doctrine inform the capabilities, mission expectations, and limitations of aviation organizations specific to maritime operations. US Naval doctrine provides additional insight into the cross-service competencies that will aid Army Aviation's transition towards amphibious capabilities necessary in the USPACOM AOR.

Army Doctrine

Despite the Army's contemporary focus on land-based operations, its most recent doctrine incorporates maritime operations more than prior editions. The most notable additions are the release of Army Aviation's capstone document, Field Manual 3-04, *Army Aviation* and its technical companion Army Training Publication (ATP) 3-04.1, *Aviation Tactical Employment.* Integrating combat tactics, techniques, and procedures with new technology, FM 3-04 expands Army Aviation's doctrine to incorporate maritime capability and joint interoperability.[33]

[33] FM 3-04, vii, 1-4. Released in 2015 and 2016, FM 3-04, *Army Aviation* and ATP 3-04.1, *Aviation Tactical Employment* supersede multiple publications, including the 1997 publication, FM 1-100, *Army Aviation Operations* and 2007's FM 3-04.111, *Aviation Brigades*.

655 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

Despite the integrated importance of Army Aviation's core competencies, rotary wing movement of personnel and equipment in joint, maritime environments requires the most integration with supported forces.[34] Rotary wing aircraft allow commanders to overcome anti-access and area denial environments to insert ground forces into the depth of an area of operations using speed and range of army aircraft.[35] Air assault and air movement operations differ in execution, but both increase its operational range and tempo a supported force can influence its operational environment.[36] In maritime environments, ground movement may be impractical or impossible. Army Aviation overcomes physical limitations by providing viable means for moving combat forces, humanitarian cargo, evacuate wounded persons, or enhance mission command capabilities across dispersed terrain.[37]

Army Aviation's rotary wing depth exceeds all other services. This ability to mass rotary wing aviation enables joint commanders to increase capacity in foreign humanitarian assistance operations. Whether deployed from naval vessels or between isolated landmasses, Army Aviation provides operational commanders with increased flexibility to achieve mission objectives or augment existing forces.

FM 3-04 and ATP 3-04.1 depict combat aviation brigade organization and serve two key purposes for maritime readiness: brigade organization and scalability. FM 3-04 outlines the

---

[34] Though the fires and intelligence capabilities are necessary in maritime environments, this monograph assumes other joint non-amphibious-based platforms can produce similar effects without requiring the use of amphibious-based aviation platforms.

[35] FM 3-04, 1-14 – 1-15.

[36] Ibid., 1-4 – 1-6. Air assaults intend to destroy enemy forces or seize key terrain. Air movements support offensive, defensive and stability operations including foreign humanitarian assistance, foreign disaster relief, and non-combatant evacuation operations.

[37] Ibid., 3-23 – 3-31.

656 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

standard CAB organization beyond the aviation restructuring initiative.[38] These publications describe scaled-down forces packages at the battalion tasks force and company team level, to ensure the necessary maintenance, sustainment, and mission command capabilities accompany the airframes.[39] Due to space limitations for equipment and personnel aboard amphibious ships, mission configured force packages are essential to optimize Army Aviation capabilities in support of joint operations on amphibious vessels or in austere environments.

A significant limitation for Army Aviation in maritime environments is the increased maintenance consideration required in saltwater environments. Salt water's corrosive effects on Army aircraft increases routine maintenance requirements. Understanding the effects of salt water corrosion in shipboard operations is critical to ensure Army Aviation capabilities endure operational assignments in maritime environments.[40]

In preparation for contingency operations in the USPACOM AOR, FM 3-04 addresses Army Aviation's mission capability in "other environments": pandemic zones; post-disaster areas; and chemical, biological, radiological, and nuclear environments. Recent events in the Asia-Pacific region exhibits these environments: avian flu, typhoons and tsunamis near populated areas, and potential conflicts on the North Korean peninsula. [41] These environments exemplify the necessary conditions in which Army Aviation must prepare to operate.

---

[38] FM 3-04, 2-1, 2-7– 2-9. The current CAB contains a headquarters and five subordinate battalions: an Attack Reconnaissance Battalion with twenty-four AH-64D/Es and twelve MQ-1C Gray Eagle Unmanned Aerial Systems (UAS); an Assault Helicopter Battalion with thirty UH-60M utility helicopters; a General Support Aviation Battalion (GSAB) with eight UH-60Ms, twelve CH-47F cargo helicopters, and fifteen MEDEVAC HH-60Ms; the thirty OH-58D Attack Reconnaissance Squadron is in transition to a Heavy Squadron with twenty-four AH-64D/Es and twelve RQ-7B UAS, an Aviation Support Battalion (ASB) provides maintenance and support.

657 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

Commensurate with the Army's Doctrine 2015 initiative, the US Army Aviation Center of Excellence's top-down Army Aviation doctrine revisions started with FM 3-04 and will cascade down to subordinate doctrine. Last updated in 1997, FM 1-564 *Shipboard Operations* details are obsolete, but retains conceptual utility for joint planning, Navy flight deck procedures, and LHD flight deck dimensions and capacities.[42] Once updated and nested into the FM 3-04 series, FM 1-564 will provide a vital tool for planning joint operations amphibious operations.

Joint Doctrine

In preparation for maritime operations, Army Aviation doctrine must nest with Joint doctrine and incorporate US Navy and Marine Corps doctrine. In its capstone document, Joint Publication (JP) 3-0, *Joint Operations* instructs the Army to prepare to employ its rotary wing assets in support of military operations across the entire range of military operations and conflict continuum. Including combat operations, JP 3-0 specifically instructs the Army to prepare to employ rotary wing capabilities in support of peace operations, including foreign humanitarian assistance and reconstructions efforts. In the USPACOM AOR, Army Aviation can provide an unmatched capability supporting foreign humanitarian assistance operations.[43]

Joint Publication 3-04, *Joint Shipboard Helicopter and Tiltrotor Aircraft Operations*, describes the unique aspects of joint shipboard operations. The publication covers all facets of pre-deployment, embarkation, and debarkation planning for joint shipboard operations, and addresses shipboard command authorities, flight/hangar deck operations, and sustainment considerations. JP 3-04 also provides general guidance for integrating aircraft from all the

658 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

services aboard air-capable ships, amphibious assault ships, and aircraft carriers. It also examines historical complications of shipboard Army Aviation operations including space limitations, aircraft incompatibility issues, and ammunition and fuel considerations.[44]

JP 3-04 addresses "mission trade-off" as the most important consideration regarding joint amphibious operations at the operational level of warfare. Amphibious assault ships and aircraft carriers are limited in quantity and fulfill strategic roles. Operational commanders must consider that embarking Army Aviation onto Navy vessels incurs mission trade-off in the removal of Navy or USMC assets which are originally designed and optimized for shipboard operations.[45] Reconfiguring aircraft carriers for Army operations requires additional Navy ships to defend the aircraft carrier. USMC MAGTFs are optimized to operate from LHD and LHA class amphibious assault ships. Army Aviation's reduced compatibility requires additional mission trade-off as compared to USMC fixed and rotary wing aviation.[46] JP 3-04 provides the general insight for Army Aviation to incorporate joint concepts, additional publications provide additional utility for specific mission scenarios.

JP 3-04's accompanying manual, JP 3-04.1, Joint *Tactics, Techniques, and Procedures for Shipboard Helicopter Operations*, requires revision but remains useful at the tactical level.[47] Once revised, JP 3-04.1 will guide FM 1-564's revision to a 3-04 series *Shipboard Operations*.

Joint doctrine spans the conflict continuum, informing expectations for Army Aviation in both combat and support operations. Joint Publication 3-03, *Joint Interdiction* addresses the

659 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

combat related end of the conflict continuum describing how Army Aviation's attack and air assault capabilities enable joint force commanders to overcome the prohibitive effects of terrain and enemy force activity to gain an advantage. Additionally, maritime interdiction can isolate enemy forces from external support, stop their actions, or enforce legal sanctions.[48] Army forces supported by Army Aviation greatly increase the available combat forces able to conduct maritime interdiction operations in the USPACOM AOR.

Addressing the peaceful end of the continuum, Joint Publication 3-29, *Foreign Humanitarian Assistance*, describes Army Aviation's unique contribution to humanitarian assistance operations. Amphibious-capable Army forces increase the overall joint force capability and throughput. JP 3-29 describes how massive international response can cripple logistics architecture, requiring military augmentation to support airfield operations and increase airlift support. Additionally, helicopters provide unmatched utility during disaster relief efforts as ground transportation infrastructure is often impaired.[49] Rotary wing casualty evacuation capabilities combined with ship-based medical capabilities greatly increase the ability to save lives in a crisis. Overall, ship-based aviation capabilities alleviate the strain on land based logistical nodes while providing critical assistance capabilities.

Joint doctrine provides conceptual information necessary to incorporate amphibious Army Aviation into joint force operations. To prepare the combat aviation brigades for tactical requirements, Marine Corps and Navy doctrine inform how its MAGTFs execute expeditionary shipboard aviation operations. Most important, Marine Corps Warfighting Publication (MCWP) 3-24, *Assault Support,* introduces Army Aviation to "Command and Control in Amphibious

---

[48] Joint Publication 3-03, *Joint Interdiction* (Washington, DC: Government Printing Office, 2011), II-4 – II-8.

[49] Joint Publication 3-29, *Foreign Humanitarian Assistance* (Washington, DC: Government Printing Office, 2014), chapter III.

660 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

Operations," detailing the authorities and procedures required to operate with the US Navy.[50] US Naval Air Systems Command (NAVAIR) published two essential Naval Air Training and Operating Procedures (NATOPS) manuals which provide CAB planners essential references for planning shipboard operations. NAVAIR 00-80T-106, *LHA/LHD NATOPS Manual* details all aspects of aviation operations from amphibious assault ships and NAVAIR 00-80T-105, *CV NATOPS Manual* describes operations aboard aircraft carriers (CV). These two comprehensive publications provide the essential details required to prepare Army Aviation units for amphibious operations.

Where doctrine guides Army Aviation's training requirements, equipment interoperability also affects joint employment in the USPACOM AOR. Previously discussed; Army Aviation cannot abandon existing competencies nor acquire airframes that achieve increased shipboard compatibility. This section examines the basics of the naval vessels Army Aviation can expect to operate from in the USPACOM AOR as well as the helicopter-specific capabilities and limitations in conducting shipboard operations.

US Navy Amphibious Ships

Amphibious based Army Aviation can operate primarily from three classes of US Navy ships. The Navy currently operates ten of the Nimitz-class nuclear aircraft carriers (CVNs) organized into multi-ship Carrier Strike Groups (CSGs). Additionally, the Navy operates one America class (LHA) and eight Wasp-class (LHD) and amphibious assault ships, which the Navy organizes into Amphibious Ready Groups to forward-deploy MEUs. Table 1 includes additional

[50] Marine Corps Warfighting Publication 3-24, *Assault Support* (Washington, DC: Government Printing Office, 2004), 1-4, 4-1 – 4-4.

661 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

ship capabilities and comparison to allied assets. Though deployable to any geographic combatant command, eleven of these nineteen ships are Pacific based in the United States and Japan.[51]

Nimitz class aircraft carriers are the world's largest warships, and though optimized for Navy and Marine Corps fixed-wing aircraft, can accommodate Army helicopters. The flagship for Carrier Strike Groups, US aircraft carriers provide the United States with an unmatched strategic strike platform and deterrent capability. Fueled by nuclear reactors, US aircraft carriers have unlimited range and are the fastest amphibious ship. While CVNs are capable of amphibious operations, they are designed specifically for open-sea operations and long-range strike.[52] No other nation's aircraft carriers match number or capability of the Nimitz class'. Embarked Army Aviation incur significant mission trade-off as the carrier must operate closer to shore with fewer fixed wing capabilities. See Table 1 for additional aircraft carrier capabilities.

Table 1. Amphibious Ship Capability Comparison

Class-Type	# Ships	# Pacific Based	Displacement (tons)	Flight Deck length	Max Helos	Well Deck	Speed	Range	Embark Troops
Nimitz - CVN	10[A]	6	101,000	1100'	50+	N	31 kts	unlimited	3000+
Wasp - LHD	8	5	41,000	818'	28	Y	24 kts	9500nm	1687
America - LHA	1[B]	1	45,000	818'	28	N	24 kts	9500nm	1687
Canberra - LHD (AUS)	2	2	28,000	757'	18	Y	20 kts	8000nm	1100

662 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

Half the size of Nimitz-class aircraft carriers, amphibious assault ships are tailored for amphibious rotary wing operations and are the best-suited ship class to facilitate amphibious based Army Aviation operations. The United States currently employs nine amphibious assault ships in two ship classes. Wasp class LHDs conduct aviation and surface amphibious operations from its flight deck and well deck, whereas America class LHAs are exclusively aviation platforms without well decks.[53] These two classes comprise the Navy's nine amphibious assault ships which serve as the primary aviation platform and flagship for Amphibious Readiness Groups (ARG).[54] The ARG supports the MAGTF ability to conduct amphibious operations near maritime littorals.

Amphibious assault ships' aviation capabilities are designed to support rotary wing operations and vertical takeoff and land fixed wing operations (AV-8B Harrier and USMC variant F-35 Joint Strike Fighters). With nine deck landing positions and storage capacity for up to twenty-eight aircraft, LHD/As can simultaneously launch or recover an Army Aviation company and embark a partial Army Aviation battalion task force.[55] Below the flight deck, LHD/As have large hangar bays to conduct aviation maintenance and vehicle and cargo storage areas. During crisis response, amphibious assault ships can expand patient treatment facilities to six hundred hospital beds, forty-six inpatient beds, and a fourteen patient intensive care unit.[56]

663 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

Amphibious assault ships habitually support expeditionary MAGTF operations and their availability to support Army Aviation is subject to mission trade-off and asset reallocation.

Allied Amphibious Ships

Australia's recent acquisition of two amphibious assault ships increased the potential bilateral for rotary wing aviation operations in the USPACOM AOR. Since 2014, the Australian Defense Forces (ADF) commissioned two Canberra class LHDs, the HMAS *Adelaide* and HMAS *Canberra*. This procurement indicates Australia's long-term commitment to Indo-Pacific security and will strengthen its military partnership with the United States.

Regarding general capabilities and capacities, Canberra LHDs provide a two-thirds scale of a US Wasp class. Notably, the Canberra class is compatible with US Army aircraft and able to launch or recover six UH-60s or four CH-47s simultaneously.[57] Despite the Canberra class smaller stature, the addition of two additional allied LHDs to the Pacific increases the multinational amphibious presence, reducing the appearance of United States amphibious unilateralism. For Army Aviation, partnered operations provide the opportunity to conduct combined amphibious operations with the ADF.

The Japanese Maritime Self-Defense Force (JMSDF) currently operates three helicopter carriers (DDHs) as anti-submarine warfare vessels.[58] Japan's two Hyuga-class and one Izumo class DDH are similar in size and capability to the Canberra Class LHDs. IN addition to anti-

[57] Royal Australian Navy Homepage, "Amphibious Assault Ship (LHD)," Fleet ship/boat/craft information page, accessed November 3, 2015, http://www.navy.gov.au/fleet/ships-boats-craft/lhd. The ADF currently operates CH-47 and UH-60 variants, but is transitioning to european MRH-90 helicopters which are better suited for shipboard operations.

[58] Military Periscope, "HYUGA (DDH-181) Class," Military Equipment Database, accessed January 16, 2016, https://www.militaryperiscope.com/weapons/ships/destroyr/w0007432.html. Japan's constitution prevents the acquisition and operations of offensive aircraft carriers, so their helicopter capable ships' primary role is defensive anti-submarine warfare.

664 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

submarine warfare, these ships conduct humanitarian support and logistical operations in the USPACOM AOR.[59] Though originally forecasted to acquire four Hyuga class DDHs, China's increased maritime presence prompted the Japanese Navy to halt production of the smaller Hyuga class in favor for the larger and more capable Izumo class DDH.[60]

Like the Canberra LHDs, Japanese DDHs are compatible with American helicopters and can simultaneously launch or recover four helicopters and store approximately ten to fifteen more on its flight deck and in the hangar. DDHs can launch an Army Aviation platoon and the embark approximately two aviation company teams. The Izumo-class DDH can accommodate up to four hundred embarked troops; a decreased capacity as compared to comparable sized United States and Australian LHDs.[61] Japan's DDH fleet provides more options to conduct multinational, Army Aviation shipboard operations in the USPACOM AOR.

By including Australian and Japanese helicopter-capable ships in addition to US platforms, the number of US-allied amphibious assault ships in the USPACOM AOR increases from six to eleven. Partnered operations provide an opportunity to increase platform availability for Army Aviation to conduct shipboard operations by overcoming mission trade-off for Navy assets that primarily support MAGTFs. Additionally, multinational shipboard operations allow Army Aviation deploy via strategic airlift to the western Pacific and embark closer to the required area of operation.

665 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

US Army Helicopters

Inherent incompatibilities between Army aircraft and amphibious assault ships reduce the efficiency that Army Aviation can conduct amphibious operations. In contrast, USMC aircraft are designed to operate from amphibious assault ships. The most significant Army aircraft inefficiency is the inability to transform automatically from an operational profile to a storage profile on the flight deck. Compact landing gear and automated blade folding systems improve USMC aircraft deck capacity and preparation time.[62] Army CH-47's size and tandem rotor design inhibit its maintenance capability as crew chief must remove its rotor blades for the aircraft to fit on LHD/A elevators. Despite these constraints, Army Aviation can conduct shipboard operations, but inform planners must account for the inefficiencies as compared to MAGTF airframes.

These Army Aviation characteristics decrease the efficiency and capacity of flight deck storage, maintenance operations, and launch and recovery.[63] Due to its degraded shipboard compatibility and efficiency, Army Aviation shipboard operations must be deliberate and limited in duration. Joint planning between the Army and Navy will resolve many of these mission impediments before operations commence. This section provided the basic doctrinal and equipment fundamental necessary for Army Aviation to conduct joint and multinational operations in maritime environments. The subsequent three case studies focus on historical military instances which contribute towards the application of Army Aviation operations in the USPACOM AOR.

Case Study #1: Operation Uphold Democracy: Haitian Liberation 1994

In 1994, Operation Uphold Democracy ushered Army Aviation into a new era of joint operations. During this mission to reinstate the exiled Haitian President, Jean-Bertrand Aristide,

666 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

the Army executed the largest amphibious, rotary wing air assault in history. Operation Uphold Democracy's distinguishing contribution to this monograph is the parallel planning effort to prepare for both an opposed airborne invasion and an unopposed/semi-opposed brigade combat team air assault using Army helicopters from a US Navy aircraft carrier. This innovative operation marked the first time Army Aviation operation of this size deployed from a Navy aircraft carrier since Doolittle's Tokyo raid in 1942.[64]

In 1990, Haiti elected Jean-Bertrand Aristide, a priest and outspoken critic of previous regimes, as president. Passionate but inexperienced, Aristide failed to bring effective change to the Haitian people. In September 1991, Lieutenant General Raoul Cedras prepared a military coup, to which President Aristide ceded power and fled to Venezuela. In response, the United States initiated diplomatic and military plans to remove Cedras' coup and re-install Aristide to power, but the collapse of the Soviet Union postponed the plans for two years.[65]

In October 1993, a United Nations envoy aboard the USS *Harlan County* arrived in Port-au-Prince to assess humanitarian conditions under Cedras' regime. To demonstrate his power to the international community, General Cedras unexpectedly employed armed naval craft and a hostile mob in the port, denying the UN team's debarkation. In response, President Clinton's administration initiated military planning to remove Cedras from power under a wide array of contingencies, from a peaceful transfer of power to full military invasion.[66]

In the spring of 1994, chief of the US Atlantic Command instructed the 18th Airborne Corps commander, then LTG Hugh Shelton, to establish Joint Task Force (JTF)-180 and commence planning the forcible entry into Haiti, OPLAN 2370. In July 1994, the US Army

Forces Commander, General Dennis Reimer, activated Major General Meade's 10th Mountain Division as JTF-190, tasked to develop OPLAN 2380, as a non-invasion branch plan to seize key Haitian infrastructure, evacuate US citizens, and stabilize the Haitian population through the transition of national power.[67] Unique to this plan was the concept of embarking elements of the 10th Mountain Division's Aviation Brigade and 1st Brigade Combat Team aboard the aircraft carrier, USS *Eisenhower*. Opting to preposition air assault forces within the Joint Operations Area provided strategic leaders the option to execute an amphibious air assault/air movement into Port-au-Prince with fewer complications due joint coordination and national approval authorities.

On short notice, the 10th Aviation Brigade transitioned from planning to training for operations aboard the USS *Eisenhower*. The 10th Aviation Brigade received their warning order on 1 August 1994 and without precedent, created a training program to simulate carrier deck landings within the week. By 8 August 1994, aircrews conducted mock deck qualifications on replica aircraft carriers painted on airfield taxiways.[68] The following week, 10th Aviation Brigade deployed its aircrews to Norfolk, VA and in just four days, conducted over twelve hundred day and night deck landings aboard the USS *Roosevelt*. More importantly, the Army and Navy maintainers and armament personnel cross-trained each other on helicopter characteristics and aircraft carrier deck procedures.[69] Through live training and shared knowledge, the 10th Aviation Brigade identified key training objectives, synchronized their embarkation and deployment plans, and qualified the requisite number of aircrews within two weeks of mission notification. Through the joint exchange in Norfolk, the aircrews gained tactical repetition, but more importantly, the

maintainers learned the nuances of amphibious based maintenance and the leaders gained an appreciation for the risks associated with amphibious flight operations.

On the 14th of September 1994, the USS *Eisenhower* and USS *America* departed Norfolk embarked with Army forces on the twelve-hundred-mile voyage to Haiti (depicted in Figure 2).[70] On 18 September 1994, with the invasion force en route to Haiti, General Cedras agreed to the peaceful terms set forth by former President Carter's diplomatic envoy.[71] Facing the reality of a US military invasion, General Cedras ceded Haitian authority and granted US military peacekeepers unopposed Haitian entry.[72]

669 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

Within hours, planners hastily adapted JTF-190's semi-permissive entry into Operation Uphold Democracy's main effort. Labeled OPLAN 2380 Plus, the brigade level amphibious air assault sought to seize key Port-au-Prince infrastructure to facilitate follow-on peacekeeping forces.[73] On 19 September 1994, 10th Aviation Brigade executed a fifty-helicopter air assault, transporting over two thousand Army soldiers from the USS *Eisenhower* to seize the Port-au-Prince airport and deter opportunist aggression by Cedras loyalists.[74]

Available shipboard Army Aviation created operational and strategic leverage. Strategically, the depth of military capabilities strengthened President Carter's negotiations and forced Cedras' surrender. Operationally, the ability to rapidly transition from a combat airborne invasion to a semi-opposed air assault gave General Shelton a variety of options to seize/secure key Haitian infrastructure without delay. One of the 18th Airborne Corps' planners explained Army Aviation's amphibious value, stating: "having the 10th mountain division's 1st brigade combat team aboard the USS *Eisenhower* gave the plan and the planners the flexibility to adapt to the last minute change in plan and the ability to adapt and meet operational requirements."[75]

As a case study, Operation Uphold Democracy demonstrated an innovative application of joint interoperability and established the maximum scale for amphibious Army Aviation operations. Tactical mission preparation for non-standard Army Aviation missions will provide operational commanders the necessary flexibility to employ Army Aviation in the USPACOM AOR to respond to emergent problems in a complex environment.[76] Additionally, the credible threat JTF-190 posed upon the Cedras regime helped used the United States' military capabilities

to reinforce diplomatic power. Exhibiting Joseph Nye's concept of "Smart Power," the next case study demonstrates Army Aviation's amphibious potential in as a missed negotiation opportunity.[77]

A counterpoint to Operation Uphold Democracy's application towards operations in the USPACOM AOR is the vast differences in the distance and security requirements between the operations in the Caribbean Sea and the Pacific or Indian Oceans. The disparate times and distances required to execute a multi-day, twelve hundred mile operation in the Caribbean pale in comparison to the multi-week or multi-month operations, six to eight thousand miles from the continental United States.[78] This case study demonstrates a feasible scenario for operational employment of amphibious Army Aviation, but it is doubtful whether the US Navy would risk the long-term mission trade-off of an entire carrier strike group to employ Army Aviation loaded aircraft carrier on the far side of the USPACOM AOR.

A significant takeaway from Operation Uphold Democracy is the importance of personnel integration over tactical training. While aircrews had to conduct hasty deck qualifications, the training was accomplished relatively quickly with minimal preparation. The most important learning point was the Army to Navy exchange that occurred in Norfolk, as this allowed subject matter experts to coordinate and identify equipment and procedural incompatibilities before they impacted mission readiness. This exchange highlights the importance of updated doctrine to identify incompatibilities and recommend operational solutions. In doing so, Army Aviation can facilitate efficient training opportunities and overcome equipment incompatibilities to help to employ Army Aviation assets from naval platforms in any maritime environment.

671 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

Operation Uphold Democracy described Army Aviation's most significant contemporary maritime operation, the execution of a brigade-level air assault from a US Navy aircraft carrier. Despite its significance demonstrating Army Aviation's shipboard capabilities, the geostrategic implications of the Caribbean pale in comparison to those encountered across the Pacific Ocean. The next case study examines a contemporary peacekeeping operation in the USPACOM AOR where geographic limitations warrant amphibious Army Aviation capability.

Case Study #2: Operation Stabilise: East Timor Crisis 1999

Operation Stabilise, the 1999 United Nations peacekeeping mission in East Timor examines the anticipated operational requirements for amphibious Army Aviation with specific emphasis on the USPACOM AOR's geography.[79] East Timor's geography exemplifies the remote location within the maritime amphibious region where joint commanders can utilize shipboard Army Aviation to introduce forces into a low-intensity, permissive environments. These operations represent Army Aviation's expected contribution to multinational foreign humanitarian assistance operations. Operation Stabilise depicts the likely future scenario in which shipboard Army Aviation capabilities can achieve a strategic advantage to deter or compel hostile foreign activities.

Gaining its independence in 2002, East Timor is one of Southeast Asia's youngest and poorest states.[80] Located in the southern Indonesian archipelago and roughly the size of Connecticut, Timor Island is divided between western Indonesian territory and East Timor occupying the remainder. Exhibiting the physical and diplomatic isolation, East Timor lacks access to natural resources and is virtually isolated from all states except Indonesia. This lack of

[79] Since Operation Stabilise, East Timor's official title changed to "Timor-Leste". This monograph uses the outdated "East Timor" to maintain continuity with reference material.

resources limits economic trade and the development of economic partners. Depicted in Figure 3, East Timor is encircled by Indonesian territory. With 275 nautical miles between East Timor and its next closest state, East Timor remains subject to Indonesian influence.[81]

Figure 3. East Timor in the South Indian Ocean

Source: "Indonesia" (map), CIA World Factbook, accessed 2 March 2016, https://www.cia.gov/library/publications/resources/the-world-factbook/geos/id.html.

In 1975, Indonesia invaded and annexed the Portuguese colony, Timor Island, initiating an era of coercive governance.[82] Australia, In an attempt to strengthen its strategic relationship with Indonesia, was one of the only world governments that recognized Timor Island's annexation.[83] Though 1980, Indonesia enforced its authority through military aggression as the Indonesian Army was the only national institution capable of imposing national control

[81] CIA World Factbook, "Timor-Leste," US Central Intelligence Agency Homepage, last modified January 7, 2016, accessed February 2, 2016, https://www.cia.gov/library/publications/the-world-factbook/geos/tt.html.

673 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

throughout its dispersed territory.[84] Throughout the 1980s and 1990s, military conflict ceased, but coercion and brutality continued, inciting East Timor's secession movement during the mid-1990s. Physically isolated and lacking economic means to forge strategic partnerships, East Timor was subject to Indonesian coercion and brutality. The matter complicated regional relations as South Pacific nations wanted to end East Timor's humanitarian crisis, but feared disrupting their strategic relations with Indonesia.[85] In 1998, Indonesian President Suharto left office which increased East Timor's secession movement.[86] In 1999, the United Nations internationally recognized East Timor's desire for independence by sponsoring a 1999 independence referendum and promised to provide a peacekeeping mission to police the fall 1999 referendum.

Early 1999, despite the auspice of an unobstructed referendum, continued Indonesian coercion attempted to influence East Timor's population to remain under Indonesian sovereignty. The Indonesian military and militia inflicted widespread violence in pro-independence areas. Throughout 1999, Indonesia's coercive practices intensified as violence spiraled into localized genocide, fostering increased tension and animosity that endured since Indonesia's 1975 occupation.[87]

674 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

The key aspect of this case study is the conflict between geo-political relations and support of humanitarian rights in poor, remote locations that inhibit neutral base access. In response to Indonesia's violence, Australia offered five thousand troops to lead the International Force in East Timor (INTERFET), a multinational UN peacekeeping coalition consisting of ten thousand troops from twenty-two nations.[88] Despite INTERFET's creation, neither Australia nor any other contributing nation authorized their forces to deploy without Indonesia's formal acceptance. Inaccessible from neutral areas, East Timor remained Indonesian sovereign territory and subject to maritime isolation; the closest neutral territory was 275 nautical miles away.[89] The inability for INTERFET to reach East Timor from neutral territory emboldened the Indonesian government's continued coercion and refusal of UN peacekeepers.

Subject to limited options, the INTERFET could either invade Indonesia or await diplomatic resolution. Unwilling to endure diplomatic and economic damage to its relationship with Indonesia, Australia awaited Indonesian approval. Despite the UN Security Force assessment that a continued Indonesian terror and destruction would precede and follow the referendum, INTERFET did not intervene.[90] This continued UN inactivity further emboldening the Indonesian military and militia to continue their violent campaign in East Timor.

Despite continued Indonesian violence, the East Timor populace overwhelmingly voted for independence on 30 August 1999.[91] Following the results, Indonesian forces killed nearly one thousand citizens and destroyed eighty percent of their dwellings.[92] This abject act of retaliatory

675 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

violence finally swayed the international community to pressure Indonesia to cease hostilities and permit the entry of the UN peacekeeping force.[93] On 12 September 1999, the Indonesian government authorized UN entry and on 15 September, the UN Security Council authorized Operation Stabilise, the Australian-led peacekeeping mission to East Timor.

Once the INTERFET arrived in East Timor, Indonesian violence subsided, but the true damage had occurred as the UN failed to interdict the violence the spring of 1999 as INTERFET reconnaissance of former Indonesian military compounds discovered evidence of execution and torture sites which exceeded prior estimates.[94] The Indonesian military was never deterred from violence because East Timor's geographic isolation and the regional strategic relationships with Indonesia prevented external intervention.

Operation Stablise demonstrates the important concept of geographic access as a necessary means to deter coercive violence in the USPACOM AOR. Without access, the INTERFET could not provide a credible deterrent to Indonesian aggression, which emboldened the Indonesian military to commit unchecked acts of violence in East Timor. Through the introduction of amphibious based aviation, the INTERFET would have gained a viable third option to intervene in East Timor. Shipboard Army Aviation capabilities may have theoretically provided UN forces with the ability seize the strategic initiative and compel the Indonesian military to cease violence.

Though it is impossible to prove whether amphibious capabilities would have prevented the stopped violence in East Timor, this case validated the utility amphibious aviation access remote objectives in the USPACOM AOR.[95] Furthermore, amphibious assault ships not only

676 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

overcome the requirement to gain access, provide a neutral location from which to project foreign humanitarian assistance capabilities. In this case, amphibious based aviation would negate the requirement to create forward operating bases as LHD/A based Army Aviation combine amphibious maintenance and medical capabilities with the Army's aerial medical evacuation (MEDEVAC) and sustainment capacity in support of foreign humanitarian assistance and disaster response operations.

Conversely, Indonesia was emboldened by their physical realities surrounding their area of operations. Conventional responses limit the prospective solution sets to the geographic constraints placed upon the problem. Additionally, extended MEU operations to facilitate long-term deterrence may work, but remain a comparatively low priority based potential mission sets required by this capable formation. Essentially, Army Aviation mere ability to execute shipboard operations can deter the opposition's military commanders or political leaders. In the East Timor case, continued shipboard operations were not required. Instead, Army Aviation could conduct a one-time air movement from ship to shore to establish a rapid buildup of humanitarian assistance capabilities ashore within hours, not days from notification.

Operation Stabilise stressed the importance of multilateral operations. In this scenario, the Australian government risked future diplomatic and economic relationship with Indonesia by supporting an Indonesian colony's secession. Though Australia's intervention prioritized ending humanitarian atrocities over political aims, their intervention strained Australia-Indonesian relations following Operation Stabilise. Australia's overwhelming contribution to the INTERFET created the perception of Australian unilateral action as opposed to a multinational UN effort. Traditional amphibious operations are most often unilateral actions. This case study highlights the need for Army Aviation to continue multinational training exercises to ensure multinational contribute to forces can gain access locations that require foreign humanitarian assistance. This application of the US smart power increases its regional credibility to reassure its regional allies

677 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

and deter its adversaries.[96] Army Aviation in partnership with Australian Defense Forces provides the United States and the international community with an additional economy of force capability to exert deterrence and truly exert smart power through the "skillful combination" of military presence and diplomacy.[97]

Though a MEU served as an operational reserve during the execution of Operation Stabilise, its capabilities were needed months before mission execution to deter Indonesia's continued violence. Another example of mission trade-off, the US military cannot dedicate its MAGTFs for multiple months in support of stability operations. Expeditionary in nature, MAGTFs are forward deployed to react to any contingency operation in its assigned AOR. Army Aviation could augment the MEU to support the UN operation and free the MEU for higher priority missions. Future conflict is most likely as states compete for access and influence in the vicinity of the major shipping lanes in the USPACOM AOR. Figure 4's depiction of the major Indo-Pacific shipping lanes emphasizes the South China Sea and Strait of Malacca, areas which bisect the "maritime amphibious region" and "continental amphibious region" previously discussed in Figure 1. These major shipping routes border areas that will likely require increased US Navy and MAGTF presence.[98] Maritime Army Aviation capabilities can focus on peripheral operations in less-essential areas or augment MAGTF operations. Army augmentation would enable MAGTF presence in strategically vital and conflict-prone areas of the USPACOM AOR.[99]

East Timor represents one instance where internal turmoil and bids for independence spur humanitarian crises that the international community must mediate in the Asia-Pacific region. West Papua, the Moluccas, Papua New Guinea, and the Solomon Islands all represent a short list of states in the maritime dominated South Pacific that exhibit the potential for international assistance.[100] Additionally, violent extremist organizations traditionally associated with the middle east are attempting to spread their influence to the Pacific region with its vast Islamic

---

enduring shipboard operations, Army Aviation's utility in one-time ship to shore operations and demonstrated deterrence mitigates the effects of salt water corrosion by limiting flight hours, thus reducing the corrosive effects and increasing the ability to conduct preventative maintenance.

Ramesh Thakur and Albrecht Schnabel (New York: United Nations University Press, 2001), 182-183.

679 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

populace.[101] US, allied, and UN presence and engagement can counter the coercive environments where violent extremist organizations recruit and operate in the USPACOM AOR.[102]

Operation Stabilise provides a scenario where Army Aviation capabilities can contribute key amphibious capabilities in permissive, joint force operations. This case exemplifies by a "most likely" scenario that necessitates Army Aviation's scalable shipboard employment to execute the USPACOM AOR's most likely and frequent missions, foreign humanitarian assistance operation. The next case study examines a "worst case" scenario which would require a large scale requirement for shipboard Army Aviation employment in the USPACOM AOR.

Case Study #3: Operation Tomodachi: Fukushima Nuclear Disaster 2011

The previous case study demonstrated Army Aviation's contribution to maritime operations to overcome increased distances between land-based support bases and operational areas. The next case study examines a historical situation where Army Aviation's shipboard capabilities would increase the aviation lift capability and throughput in response to large-scale maritime operations demands. Operation Tomodachi examines a scenario where the response to a catastrophic event warrants Army Aviation to augment traditional amphibious capabilities in the USPACOM AOR.[103]

Combining maritime, post-disaster, and radiological factors, Operation Tomodachi simultaneously incorporates three demanding environments in which Army Aviation doctrinally operates.[104] Operation Tomodachi exemplifies Army Aviation's ability to augment a large-scale

foreign humanitarian assistance operation. This case study represents Army Aviation's maximum anticipated requirement in response to crises in the USPACOM AOR.

Midafternoon, on March 11th, 2011, a magnitude-nine earthquake erupted on the Pacific Ocean floor, eighty miles east of the Japanese coast (as depicted in Figure 5). Fifty-five minutes later, a fifty-foot tall tsunami inflicted extraordinary destruction upon Japan's coastal infrastructure and catastrophic damage to the nuclear reactors at the Fukushima Daiichi power plant.[105] The combined effects of the tsunami's infrastructural damage and mounting nuclear crisis exceeded Japan's emergency response capability.[106] Though the event occurred only one hundred miles north of Tokyo, the extensive infrastructural damage (highways, airfields, rail

lines, electric, telecommunication) prevented Japan's Nuclear and Industrial Safety Agency from assisting with a national response.[107] Additionally, the proximity to the capital's vast population raised the concerns of unmitigated radioactive fallout on populated areas.[108] By the end of 11 March 2011, the Japanese government, one of the best prepared in the world, required international assistance to counter this catastrophe.

By 12 March 2011, the Government of Japan's declared a state of emergency. Forty-five countries offered assistance, but the Japanese government declined aid from all but four allies to avoid over complication. Based on established diplomatic and military partnership, the United States, Australia, New Zealand, and South Korea commenced Operation Tomodachi, the international disaster response to the Japan.[109] In all, the tsunami's effects forced the evacuation of over two hundred thousand Japanese civilians, over one hundred billion dollars in damages, and resulted in over twenty-six thousand fatalities.[110]

The United States response to the incident had domestic and coalition objectives. First, the US government retains the responsibility to safeguard its citizens abroad. Second, the United States provided nuclear expertise and foreign humanitarian assistance to its longtime ally. By March 16, 2011, the US Secretary of Defense committed over twenty-four thousand US forces, twenty-four naval vessels, and 140 military aircraft in a three-phased response.[111] The initial priority, save civilian lives and prepare to evacuate American citizens. The second priority, deliver basic human needs and restore essential civil services. The third priority, restore Japan to

pre-disaster conditions.[112] Despite the global effort to coordinate and deliver disaster response materiel to the region, the USMC 31 MEU's rotary wing and tiltrotor aircraft provided the critical capability to deliver these necessities to the affected disaster areas.

Immediately following the disaster, the Okinawa-based 31 MEU provided the most useful capabilities during Operation Tomodachi. Aboard the USS *Essex's* amphibious readiness group, 31 MEU arrived at the disaster area ready to evacuate American citizens and provide amphibious based foreign humanitarian assistance operations off the Pacific coast.[113] Though the MEU fulfilled its mission requirements, two minor variations to the operating environment may have required augmentation by Army Aviation: increased demand for personnel evacuation and decreased available MEU aircrews due to radiation exposure.

In the initial response to the meltdown of the Fukushima Daiichi reactors, the Japanese government established a twelve-mile evacuation radius based upon fallout assessments.[114] 31 MEU possessed the necessary lift capabilities to evacuate the affected zone. Days later, the evacuation radius expanded drastically, from twelve to fifty miles based upon deteriorating meteorological conditions. The increased the evacuation area nearly tenfold and threaten radiological exposure in Tokyo, increasing assessed exposure levels at the US embassy to evacuation thresholds in only four days.[115] Though the government rescinded the fifty-mile evacuation radius, the American and Japanese evacuation requirements would have exceeded 31 MEU's lift capabilities. Tokyo's increased exposure would re-prioritize the US military mission

683 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

from foreign humanitarian assistance to American citizen evacuation.[116] Army Aviation assets could augment MAGTF aviation to fulfill foreign humanitarian assistance obligations and allow the operations to allow the MAGTF to accomplish its higher priority missions.

During Foreign Humanitarian Assistance operations, helicopters provide critical lifesaving capabilities to operational commanders.[117] Amphibious assault ships possess vast medical capabilities, second only to the Navy's hospital ships. In response to a crisis, LHD crews can expand their patient treatment facilities to upwards of six hundred hospital beds, complimented by a fourteen patient intensive care capacity and a forty-six-bed inpatient ward.[118] By pairing US Army MEDEVAC with an LHD's medical facilities provides immediate medical capacity well before comparable medical facilities can be established ashore.

Increased operational requirements are one factor which necessitates increased rotary wing augmentation; another is the degradation of available rotary wing assets. During Operation Tomodachi, aircrew and airframe cumulative radiation exposure directly limited 31 MEU's ability to conduct enduring operations. The radiological environment in the immediate disaster vicinity prevented the establishment of local support areas. Naval platforms maneuvered closer and farther away from the contaminated area based upon prevailing meteorological conditions. This ability to move the amphibious ship's location to suitable areas decreased the crew's exposure and increased their ability to support operations.

Though aerial radiological exposure is minimal compared to ground exposure, the cumulative effects degrade enduring operational capabilities. During Operation Tomodachi,

684 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

routine radiological tests aboard the USS *Essex* and USS *Ronald Reagan* identified radiation on at least three aircraft and seventeen aircrew members.[119] Though decontamination proved successful, the time-intensive decontamination process degraded operational readiness. Furthermore, cumulative radiological exposure limitations establish maximum safe exposure levels crewmembers can endure before risking permanent health complications. During Operation Tomodachi aircrews did not exceed exposure thresholds. However, in future scenarios, aircrews may surpass exposure limitations, requiring augmentation forces to continue the mission.

Operation Tomodachi was an operational success without the use of Army Aviation. However, future operations may require increased aviation capabilities to meet the objectives. Though the combined tsunami and radiological effects are unlikely, worst-case scenario, overpopulation, frequent natural disasters are representative of the region and require preparation for future assistance operations in the USPACOM AOR. Furthermore, Operation Tomodachi also demonstrates how foreign humanitarian response operations are not limited to impoverished states, but also occur in states with modern governments and militaries. Army Aviation's ability to augment these operations will strengthen US Pacific alliances and uphold their ability to respond to regional challenges.[120]

Following the tsunami's destruction, essential civil services were either inoperable due to the tsunami or located in the radiation fallout zone. These factors negated ground response assets, making helicopters the primary means to support the operational area, emphasizing amphibious rotary wing aviation as a critical capability in the operation.[121] Army Aviation's ability to conduct Brigade or Battalion sized operations aboard naval ships provides operational commanders and

---

685 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

political leaders with an increased capacity to conduct large-scale amphibious rotary wing operations to facilitate foreign humanitarian assistance and disaster response operations.

With its increased population density and location around the Pacific rim, the USPACOM AOR's nations are subject to many crises which require a unique US response. Army Aviation's increased maritime capabilities will facilitate increased United States ability to conduct foreign humanitarian assistance operations. This capability will increase US international influence. Pandemic outbreaks, volcanic eruptions, earthquakes, and tsunamis represent the common occurrences which may require international assistance in the USPACOM AOR's maritime regions.[122]

In contrast to Operation Stabilise's requirement for limited aviation capabilities, Operation Tomodachi exemplifies the need for large-scale aviation capacity. This case study examined a scenario which may require the maximum US crisis response in the USPACOM AOR, requiring the need for a combat aviation brigade complement of utility and cargo aircraft. Environmental exposure rates in future operations could require an Army Aviation to augment or relieve a MAGTF to continue foreign humanitarian assistance operations in affected maritime areas.[123]

As a counterpoint to Army Aviation's ability to augment MAGTF crisis response capabilities again revolves around the joint concept of mission trade-off and limited availability of helicopter-capable ships. While US Navy assets may not be available, this increases the requirement for Army Aviation to maximize its unmatched rotary wing depth with available ADF LHDs or JMSDF DDHs ships.

686 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

Overall, these three case studies provided historical examples where actual, or potential Army Aviation capabilities provided utility towards accomplishing mission objectives in maritime environments. The increased trend in joint and multinational training exercises throughout the USPACOM AOR highlights the increased opportunities to train and employ shipboard Army Aviation capabilities.

Contemporary Multinational Operations: US Army Aviation with Pacific Partners

In accordance with the 2015 National Security Strategy, the United States will increase its multinational partnerships and military operations with its Pacific allies. This effort to modernize its military alliance seeks collaborative relationships to diversify the United States' "posture and presence" and demonstrate its resolve to America's Pacific partners and adversaries.[124] Maritime-capable Army Aviation reassures US allies of America's regional commitment and ability to increase multilateral partnership with Australian Defence and Japanese Self-Defence Forces. Applying America's military strengths in unilateral and multinational operations preserve the ability to exert US influence throughout the USPACOM AOR.[125]

Maritime aviation capability is essential for the Army to secure its national interests and is best achieved through joint and multinational interoperability.[126] Consistent with the Army Operating Concept, enhanced Army Aviation increases the joint force commander's employment options in maritime environments across the continuum of conflict.[127] The government's desire

for soft power aligns with military commanders' desire for an Army capable of rapid response to isolated aggression, small conflicts, and natural disasters in the USPACOM AOR.[128]

The US government leverages Army Aviation to increase "soft power" in the Pacific by increasing partnership with low-intensity, foreign humanitarian assistance operations.[129] This "capability dividend" increases military presence without decreasing deterrence by over-tasking US expeditionary forces in the USPACOM AOR.

Strategically, bilateral foreign humanitarian assistance operations demonstrate the combined capabilities which allow the United States, Australia, and Japan to reinforce alliances and deter adversaries.[130] Operationally, partnered Army Aviation operations, when available, benefit the US military by utilizing foreign military capabilities to circumvent LHD/A utilization trade-off. The ADF and JMSDF benefit via increased access to amphibious-capable Army Aviation. Furthermore, using US strategic airlift to embark Army Aviation in Australia or Japan reduces Pacific transit delays.

Australia's Canberra-class LHDs increase ADF's ability to influence the Indo-Pacific region via foreign humanitarian assistance and multilateral training exercises.[131] These ships also provide Army Aviation its greatest opportunity for partnered amphibious operations in the USPACOM AOR. Army Aviation must continue allied amphibious exercises with ADF to increase partnered interoperability and regional multilateralism. The US-Australian alliance must

688 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

prevent the rise of terrorism and violent extremist organizations in the weakly governed and impoverished Southeast Asian maritime region.[132] These opportunities for Army Aviation to partner with ADF increases Australia's capabilities and US presence in the USPACOM AOR.

Though Army Aviation applications in the USPACOM AOR will support regional deterrence, increased trilateral partnerships between the United States, Japan, and Australia potentially provoke an unintended response by threatening their adversary's influence.[133] To avoid provocation, Army Aviation must start maritime applications with low-intensity operations establish the Army's image without excessive provocation. Multinational forces must overcome strategic and operational incompatibilities by developing common understanding via basic military principles: communications protocols, common logistics, and information/intelligence sharing methods.[134] Routine military engagement and regular training exercises are the most effective and affordable methods to achieve maritime military commonality and interoperability in USPACOM's complex AOR.

Exercises: Pacific Pathways

Despite the benefits of multilateral operations, practical applications prove difficult to support due to fiscal shortfalls and amphibious ship unavailability. Recently the Army has led an initiative meant to reduce the budget constraints and asset unavailability by replacing individual bilateral training exercises with successive, multilateral exercises throughout the USPACOM AOR. The development of Pacific Pathways transformed separate bilateral exercises into a collective, multi-month operation to enhance military interaction with Pacific allies.[135]

Two of the most prominent Pacific exercises, Talisman Saber and Yama Sakura, incorporate consistency with the United States' two most significant Pacific allies: Australia and Japan. Biannually, Talisman Saber exercises ADF and US Forces in joint operations ranging from combat operations to foreign humanitarian assistance.[136] Annually, Yama Sakura exercises Japan's Self-Defense Forces with US Forces in a two-week event to strengthen regional stability and improve US-Japanese interoperability.[137] Talisman Saber and Yama Sakura provide Army Aviation the opportunity to improve its amphibious capabilities aboard the ADF's Canberra LHDs and JMSDF's Hyuga and Izumo-class helicopter carriers. Together these two exercises

690 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

present Army Aviation with rare opportunities to exercise bilateral, shipboard aviation operations in the USPACOM AOR.

Pacific Pathways' vital contribution to Army Aviation is the employment of reduced-scale Army Aviation elements in maritime operations. Unlike Operation Uphold Democracy's massive CAB operation, smaller-scale employment provides two advantages. First, smaller elements reduce embarkation requirement. Less embarked assets increases Army access to scarce US and allied nation naval assets. [138] Second, employing company-sized aviation teams facilitates operational innovation and experimentation. This innovation advances mission command, maintenance, and tactical procedures necessary to develop functional maritime doctrine. Despite its advantages, scaled-down aviation operations cannot replicate the staff tempo or support requirements associated with larger operations like Operation Tomodachi or Uphold Democracy. Ultimately, Pacific Pathways provides Army Aviation with the opportunity to integrate aviation and naval capabilities to increase the speed and agility of ground combat forces to prevent, shape, and win in the USPACOM AOR.[139]

Despite Pacific Pathways' utility, critics assert that Army-Pacific engagement duplicates the US Marine Corps' expeditionary mission, effort, and budget.[140] Though correct that the Marine Corps' training and equipment are ideal for Pacific operations, increased Army maritime capabilities will enable USMC expeditionary forces to remain ready and available to respond to immediate contingencies and decisive action. Maritime Army units will not replace MAGTFs. Instead, Army Units will augment USMC capabilities to increase US presence and capabilities in the USPACOM AOR.

Future Considerations and Research

A specific area for future research is Army Aviation's continued maritime application of its future aviation platforms and capabilities in the USPACOM AOR. Two current acquisition priorities outline Army Aviation's continued maritime capabilities: the Future Vertical Lift initiative and rotary wing Manned-Unmanned Teaming.

Through 2030, Army Aviation forecasts no new rotary wing acquisitions which leaves fifteen to twenty years of aircraft continuity to improve existing shipboard interoperability.[141] Despite the Army's airframe continuity, US Marine Corps aviation continues its transition to next-generation aircraft including V-22 Osprey tiltrotor and F-35 aircraft. As the primary user of LHD/A ships, the Marine Corps' transition will likely incorporate Navy procedural changes, requiring Army Aviation to remain up-to-date. This timeframe also includes a three ship increase in aviation-capable amphibious ships with the scheduled commissioning of one additional America class LHA and two Ford class CVNs.[142] Through 2030, no significant detractions exist that would weaken Army Aviation's commitment to maritime proficiency.

The US Department of Defense future vertical lift (FVL) initiative's goal is to achieve cross-service rotary and tiltrotor interoperability and reduce sustainment costs through development and acquisition of common future airframes.[143] The Army recently approved two

aircraft designs FVL prototype development: one modified tiltrotor and a coaxial-rear thrust variant.[144] The tiltrotor variant benefits from increased maximum speed and longer range, but also occupy more flight deck space than existing Army aircraft. The benefits of the coaxial variant's reduced space requirement is countered by its lack of speed and range due to its fixed main rotor aerodynamic limitations.[145]

Army rotary wing operations will become increasingly interoperable with its organic unmanned aerial systems. Current UAS configurations prevent shipboard operation. The RQ-7B Shadow requires no runway to launch, but the likelihood of a shipboard recovery is unlikely and prevents launch and recover operations afloat. The MQ-1C Gray Eagle cannot conduct shipboard operations, but its extended range allows for manned-unmanned-teaming near maritime objectives. This ability to implement Gray Eagle UAS into maritime intelligence, surveillance, and reconnaissance roles will offset the number of required attack and reconnaissance aircraft from embarked requirement and increasing overall economy of force.

Conclusion

Army Aviation's future application in the USPACOM AOR requires the identification of optimal maritime missions for Army employment and the corresponding emphasis on the development of maritime capabilities. Historical events, current military and political trends, and opportunities for multinational military partnership all define how Army Aviation must evolve to increase its utility in the USPACOM AOR. Despite Army Aviation's capabilities, limited amphibious ship availability poses the principal limitation which constrains Army Aviation maritime applicability. Army Aviation doctrine, organization, and training must incorporate three

693 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

recommendations to develop and improve future maritime capabilities: immediate doctrine revision to incorporate maritime capabilities, aviation training focused on company-sized shipboard operations, and the prioritization of low-intensity and multinational operations.

As defined in JP 3-04, mission trade-off remains the most significant impediment to Army Aviation's shipboard employment. Employing scarce US Navy amphibious ships in non-standard configurations incurs such a high opportunity cost that only strategically important missions necessitate shipboard Army Aviation. Contemporary Pacific Rim operations incur greater risk than exhibited in Operation Uphold Democracy as increased proximity to anti-access, area-denial threats and extended sea lines of communication decrease Army Aviation's maritime utility. Mission trade-off refutes the first stated contention that Army Aviation must retain the ability to transport Brigade Combat Teams in maritime environments. Though applicable in the land domain, this contention is infeasible for general shipboard application. Army Aviation must retain the ability to support Brigade Combat Team-sized operations in the USPACOM AOR where land basing is suitable to support the depth of the operational environment. Also, mission trade off validates contentions two and three, confirming amphibious Army Aviation must support Brigade Combat Team and smaller operations must support strategic importance.

To increase its maritime applicability in the USPACOM AOR, Army Aviation must first codify and disseminate the baseline doctrine required to execute joint and multinational shipboard operations. As proven in Operation Uphold Democracy, cross-service communication founded in doctrine and professional expertise allowed 10th Aviation Brigade to overcome aircrew-training deficiencies in preparation for an unprecedented mission. As Army Aviation prepares to conduct joint and multinational operations with the United States, Australian, and Japanese amphibious navies, improved doctrine will enable Army planners to anticipate requirements, identify opportunities, and mitigate risks. The doctrine priority is to update FM 1-564 *Shipboard Operations'* in accordance with FM 3-04, *Army Aviation* and JP 3-04.1 *Joint Tactics, Techniques, and Procedures for Shipboard Helicopter Operations.* Updated doctrine will allow combat

694 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

aviation brigades to incorporate basic maneuvers and academics into home station aircrew training programs to exercise shipboard operations in simulators and training areas to increase deck qualification proficiency in the absence of naval vessels.

Army Aviation must focus on small-scale, limited-duration maritime operations. Though effective in Operation Uphold Democracy, mission trade-off eliminates the likelihood of large-scale application in the USPACOM AOR. The focus on one-time ship to land missions and limited duration amphibious operations minimizes interoperability complications and reduces aircraft exposure to corrosive environments. This combines Uphold Democracy's method to introduce Army rotary wing assets from a maritime environment proved essential in Operations Tomodachi and Stablise to overcome geographic or diplomatic constraints. Deploying company-sized elements optimizes embarked task organization to ensure the necessary operational, maintenance, and support personnel and equipment accompany each unit. Reduced-scale operations increase the access and availability of suitable US Navy, Australian Defense Force, and Japan's Maritime Self-Defense Force ships and expand US military presence throughout the USPACOM AOR.

Multinational-partnered shipboard operations provide a dual benefit. First, these operations overcome US Navy mission trade-off required of its limited number of ships. Second, and shortens the distance and transit required to deploy Army forces by forward deploying helicopters via more efficient methods (strategic airlift or cargo shipping). In-theater embarkation decreases airframe exposure and decreases transit time to joint operations areas. Operation Stabilise identified an opportunity to partner US Army capabilities with Australian assets to increase the multinational UN presence. The Australian Navy's amphibious platforms offer an ideal opportunity to merge regional amphibious capabilities with the US military's depth of rotary wing capabilities. The Australian Defense Force's relative lack of utility and cargo helicopters exemplifies the mutual benefit of US combat aviation capacity paired with allied amphibious

695 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

capabilities. Despite the advantages of allied operations, multinational employment does incur the increased risks associated with cultural, professional, and procedural differences between allies.

By implementing these recommendations, Army Aviation will increase its utility at all levels of war. Maritime-capable Army Aviation will not only increase military efficiency at the tactical and operational levels of war, but also increase the US military's strategic deterrence by broadening its ability to project combat power ashore. Exhibited during Operation Uphold Democracy and suggested for Operation Stabilise, integrated maritime capabilities enhance the United States' ability to deter conflict and aggression alongside its allies in the USPACOM AOR.

In Operation Uphold Democracy, the adversary's political leadership lost its strategic leverage when faced amphibious, air-capable forces which allowed the United States to avoid a military invasion and seize control by less hostile means. Preceding Operation Stabilise, the creation of a multinational United Nations amphibious-capable task force may have provided a decisive option to introduce peacekeepers into East Timor without risking invasion. Army Aviation's increased operational capability will allow the United States to prioritize its maritime assets to strengthen regional deterrence. Best suited to execute foreign humanitarian assistance missions, maritime-capable Army Aviation will allow the United States to focus its more-capable maritime assets, Navy Carrier Strike Groups and Marine Air-Ground Task Forces, towards more complex operational environments: the South China Sea, Strait of Malacca, or emergent threats from regional violent extremist organizations. Army Aviation's increased maritime competence will strengthen the US strategic advantage in the USPACOM AOR.

Overall, Army Aviation allows the US military to expand its capacity to conduct joint operations in maritime environments. By focusing on operations at the battalion and company level, Army Aviation will increase the US military's ability to conduct amphibious operations in maritime environments. Simultaneously, Army Aviation must remain balanced to train and deploy combat aviation brigades to provide integrated aerial support to combined, joint, and multinational operations throughout any land or maritime operational environment.

Global Force Management (GFM) is a force-allocation process-driven system that distributes military forces across the globe to meet Combatant Commander objectives. The goal is to match military capabilities provided by the military services to Geographic Combatant Commander requirements. This thesis is a proof of concept for an optimization model that maximizes the distribution of a finite number of full motion video intelligence, surveillance, and reconnaissance (ISR) assets to a prioritized list of requirements to meet national security objectives.

This thesis examines the ISR GFM process. With the insight gained to the process, the model applies a mixed integer linear programming formulation to provide an optimized force allocation recommendation The model's objective function managed the trade-off between FADM priority and platform consideration, which optimized the allocation 902 hours per day of full motion video to meet 1902 hours per day of 20 CCDR requirements.

The research, methodology, and analyses presented in this thesis is a successful proof of concept proving that this optimization model will objectively inform senior decision makers in the Department of Defense for intelligence surveillance reconnaissance Global Force Management allocation.

ABSTRACT

Global Force Management (GFM) is a force-allocation process-driven system that distributes military forces across the globe to meet Combatant Commander objectives. The goal is to match military capabilities provided by the military services to Geographic Combatant Commander requirements. This thesis is a proof of concept for an optimization model that maximizes the distribution of a finite number of full motion video intelligence, surveillance, and reconnaissance (ISR) assets to a prioritized list of requirements to meet national security objectives.

This thesis examines the ISR GFM process. With the insight gained to the process, the model applies a mixed integer linear programming formulation to provide an optimized force allocation recommendation The model's objective function managed the trade-off between FADM priority and platform consideration, which optimized the allocation 902 hours per day of full motion video to meet 1902 hours per day of 20 CCDR requirements.

The research, methodology, and analyses presented in this thesis is a successful proof of concept proving that this optimization model will objectively inform senior decision makers in the Department of Defense for intelligence surveillance reconnaissance Global Force Management allocation.

EXECUTIVE SUMMARY

Global Force Management (GFM) is a force-allocation process-driven system that distributes military forces across the globe to meet Combatant Commander objectives. The goal of GFM is to match military capabilities provided by the Services to Geographic Combatant Commander requirements. This thesis is a proof of concept for an optimization model that maximizes the distribution of finite number of assets to a prioritized list of requirements.

The Secretary of Defense (SECDEF) directs the Global Force Management (GFM) allocation process in the Dissemination and Guidance for the Employment of the Force. The National Strategic Strategy, the National Defense Strategy, and the National Military Strategy direct, guide, and inform the GFM process. The National Strategic Strategy establishes national priorities; the National Defense Strategy guides the Department of Defense (DOD), which along with the National Military Strategy, provides strategic direction.

The GFM process organizes and distributes military forces to meet Geographic Combatant Commanders (CCDRs) requirements. The allocation process looks across the entire DOD to identify and recommend the most appropriate and responsive force that can meet CCDR requirements. Each force request culminates in a Secretary of Defense (SECDEF) decision and subsequent deployment order to allocate a force. The forces come from several sources, including: a Service Secretary such as the Army, Navy, Marine Corps, or Air Force; a CCDR's assigned forces; or forces from other DOD Agencies. The SECDEF allocates the forces to the requesting CCDR based on informed recommendations from the Joint Staff. The design of the entire global force management process allows the SECDEF to make prioritized decisions for the employment of the force. The product of the GFM process is deployed military forces to the Geographic Combatant Commanders (CCDR).

719 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

This thesis focuses on the intelligence, surveillance, and reconnaissance capabilities within the GFM process. Typically, ISR capabilities such as full motion video (FMV) are in high demand by CCDRs. However, the availability of ISR platforms is severely limited. ISR capability is described as high demand and low density. Because of the ability of ISR platforms potentially to provide capability to multiple CCDRs from a common operating location and competing demands for mission critical requirements, the allocation of ISR forces includes close coordination between the Joint Staff, CCDRs, force providers, and the Joint Functional Component Command for Intelligence, Surveillance, and Reconnaissance (JFCC ISR).

The challenge with the current ISR allocation process is objectively quantifying the reason behind a recommended sourcing solution for ISR global allocation. Current military operations across the globe experience more demand from the Geographic Combatant Commanders (GCC) than the Force Providers have assets available to meet the GCC requirements. The Joint Staff, in concert with USSTRATCOM, use many factors to prioritize allocation of assets to include determining which GCC gets the assets and for how long. The decision influencers recommend a resource allocation solution based on experience, force capacity, GCC demand, and the strategic environment provided by guidance from the National Security Council (NSC).

The ISR allocation optimization model applies to any of the ISR requirement capabilities, including but not limited to Full Motion Video (FMV), Signals Intelligence (SIGINT), Communications Intelligence (COMINT), and other intelligence collection capabilities. The complexity of FMV force allocation makes FMV the ideal capability to use for a proof of concept.

Hypothetical data is used to keep this thesis unclassified. The platform capabilities come from a small sampling of ISR FMV platforms that have sufficient open-source information to make the model relevant. The hypothetical CCDR requirements are derived from and loosely based on historical data from GFMAP force allocations. Actual CCDR requirements, force capacities, and FADM priorities are classified. The model uses a methodical approach using known data and informed assumptions to develop reasonable scenarios to implement in the model.

720 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

This optimization model and its methodology uses full motion video capability and notional requirements to model the applicably of optimization in the Global Force Management allocation process. The model uses an objective function that to maximize the hours of FMV allocated to each CCDR to meet the prioritized mission requirements. The objective function manages the trade-off between ISR platform constraints and CCDR requirements constraints.

Results from the base model, which only considered FADM for allocation prioritization, shows that with only 902 hours per day of FMV capacity to meet 1902 hours per day of requirements, the optimized solution provided 100 percent of the requirement capability to 12 of the 20 CCDR requirements and a partial allocation of 39 hours per day or nine percent of the requirement to the single next lowest FADM priority requirement. These results are useful to inform senior decision makers within the DOD of which requirements will not receive a capability allocation. The results can be compared against the actual Global Force Management Allocation Plans to highlight which lower FADM priorities are actually receiving a force allocation. The reasons for the differences can inform decision makers that the strategic priorities do not align to how the allocation is being allocated. For force providers and DOD budget personnel, the gaps highlight areas where additional resources can be committed to meet strategic objectives.

Combining and balancing FADM and platform consideration into the optimization model allows decision makers a model that more closely resembles current allocation methods. The results of the combined model change if we modify the $value_{ij}$ parameter for a particular platform. This change may represent where the platform consideration is modified based on new information or just to examine model sensitivity. This is the expected result because the model is using the product of platform consideration times the FADM priority to define $value_{ij}$ in the objective function. The objective function manages the trade-off between FADM priority and platform consideration. The combined model more closely simulates how the force allocations recommendations are made because it takes into account regional geographic realities while managing global strategic priorities.

721 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

The current GFM process method cannot quantify and objectively compare the specifics of platform considerations and strategic priority. This model highlights the areas where there may be trade-space for additional allocation opportunities. For example, if the only means to provide capability to a specific ISR requirement is allocating manned aircraft, the model will show what requirements will be affected to meet that limitation. Additionally, by interpreting the results, the CCDR can assess where their requirement priorities are evaluated globally across all of the CCDR's requirements. The Joint Staff can evaluate the data to verify that the results support the military objectives of the National Military Strategy. If the results do not support the strategic objectives then the CCDR priorities and the force provider capacity must be scrutinized to mitigate the capability and requirement gaps. The impact implications are important to the Combatant Commanders for mitigation options and important to the SECDEF for accepting the risk associated with the recommendation.

Combining the optimization model described throughout this thesis with a risk informed model that can be implemented for the force allocation of all ISR capabilities is a logical evolution that optimizes the force allocation decision process that informs the SECDEF for force decisions and responsibility. This thesis critically examines the GFM ISR allocation process and the factors that influence it. With the insight gained about the process, the proof of concept applied a methodical optimization formulation to a complex ISR force allocation problem that is complicated further by significantly less capacity than demand. The research, methodology, and analyses presented successfully prove that this optimization model will objectively inform senior decision makers in the Department of Defense for intelligence surveillance reconnaissance Global Force Management allocation.

I. INTRODUCTION

A. BACKGROUND

Global Force Management (GFM) is a force-allocation process-driven system that distributes military forces across the globe to meet Combatant Commander objectives. The goal is to match military capabilities provided by the Services to Geographic Combatant Commander requirements. This thesis is a proof of concept for an optimization model that maximizes the distribution of finite number of assets to a prioritized list of requirements.

Chapter I begins with a broad description of GFM and the documents that direct and guide the process. It introduces how GFM addresses and balances risk to both the Services and the Combatant Commanders. This chapter asks the question, "What can be added to the GFM process to objectively inform senior decision makers in the Department of Defense for intelligence surveillance reconnaissance (ISR) Global Force Management allocation?" Although GFM addresses the allocation of all military capabilities, this thesis focuses on intelligence, reconnaissance, and surveillance capabilities; specifically full motion video. The requirements demand for ISR and full motion video significantly exceeds global capacity of assets available. This makes ISR full motion video capability an ideal candidate for optimization.

The methodology outlined in Chapter II breaks down the GFM process into decisional process steps. It identifies who the decision makers and influencers are in each step. The purpose of Chapter II is to develop an understanding of the GFM process as it exists today and to get a sense its complexity. With this foundational understanding, the paper describes the specifics of the ISR allocation process. ISR allocation recommendations are based on a combination of objective and heuristic data and variables.

Chapter III introduces the objective function which maximizes the number of hours of ISR capability provided to the Geographic Combatant Commanders in to meet

723 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

prioritized mission objectives. It introduces the indices, parameters, and constraints that shape the implementation of the model.

Chapter IV describes in detail, the indices, parameters, and constraints introduced in Chapter III using notional data. It describes the assumptions made in the model development. The model applies a methodical approach using known data and informed assumptions to develop reasonable notional scenarios for implementation in the model. This chapter describes the analyses of the results.

Chapter V summarizes the success of the optimization model and recommends continued development of the model to include all ISR capabilities. It also recommends a model that takes into account risk informed factors. Building on both models, we can apply the next iteration to the emergent allocation process.

1. Global Force Management System Process

The Secretary of Defense (SECDEF) directs the Global Force Management (GFM) allocation process in the Dissemination and Guidance for the Employment of the Force.[1] The GFM process organizes and distributes military forces to meet Geographic Combatant Commanders (CCDRs) requirements.

The National Strategic Strategy, the National Defense Strategy, and the National Military Strategy direct, guide, and inform the GFM process. The National Strategic Strategy establishes national priorities; the National Defense Strategy guides the Department of Defense, and the National Military Strategy provides strategic direction. The following strategic planning documents guide GFM:

- Unified Command Plan signed by the President of the United States (POTUS)

  Unified Command Plan (UCP) establishes the combatant commands, identifies geographic areas of responsibility, assigns primary tasks, defines authority of the commanders, establishes command relationships, and

[1] Secretary of Defense. 2015. (U) *"Dissemination of the Guidance for the Employment of the Force."* Washington, DC: Department of Defense. This document is classifed SECRET.

724 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

gives guidance on the exercise of combatant command. The President of the United States approves the UCP. The CJCS publishes the UCP for the commanders of combatant commands.

- Joint Strategic Capabilities Plan

  The Joint Strategic Capabilities Plan (JSCP) carries out the Chairman of the Joint Chiefs of Staff National Military Strategy and provides guidance to combatant commander and the JCS to accomplish tasks and missions based on current military capabilities.

- Global Force Management Implementation Guidance

  The Global Force Management Implementation Guidance (GFMIG) establishes procedures for assignment, allocation, and apportionment of U.S. military forces. The GFMIG includes a military risk matrix.

  The Secretary of Defense (SECDEF) approves the GFMIG.

- Guidance for Employment of the Force

  The Guidance for Employment of the Force (GEF) provides both the president's guidance for contingency planning and conveys the SECDEF's guidance to focus on the use of existing Department of Defense forces to accomplish near-term objectives.

  The GEF establishes the defense posture for a 2–15-year timeframe

  The GEF inherently accepts risk and informs decision makers across the DOD to make risk-informed decisions. The GEF prioritizes greatest national security risks and highest consequence issues.

The allocation process looks across the entire DOD to identify and recommend the most appropriate and responsive force that can meet CCDR requirements. Each force request culminates in a Secretary of Defense (SECDEF) decision and subsequent deployment order to allocate a force. The forces come from several sources, including: a Service Secretary such as the Army, Navy, Marine Corps, or Air Force; a CCDR's assigned forces; or forces from other DOD agencies. The SECDEF allocates the forces to the requesting CCDR based on informed recommendations from the Joint Staff.

The allocation process illustrated in Figure 1 is the OV-1 diagram from the Joint Staff Global Force Management Enterprise Integration Architecture document (Joint Staff 2014). The Global Force Management process provides feasible sourcing options to the SECDEF with the decision support process to assess quickly and accurately current and future impact and risks associated with proposed force changes. Each allocation

725 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

recommendation balances force provider risk to force with CCDR risk to mission. Assessing force allocation risk is complex. A CCDR must assess risk to current operations while at the same time predicting risk to strategic operational plans.

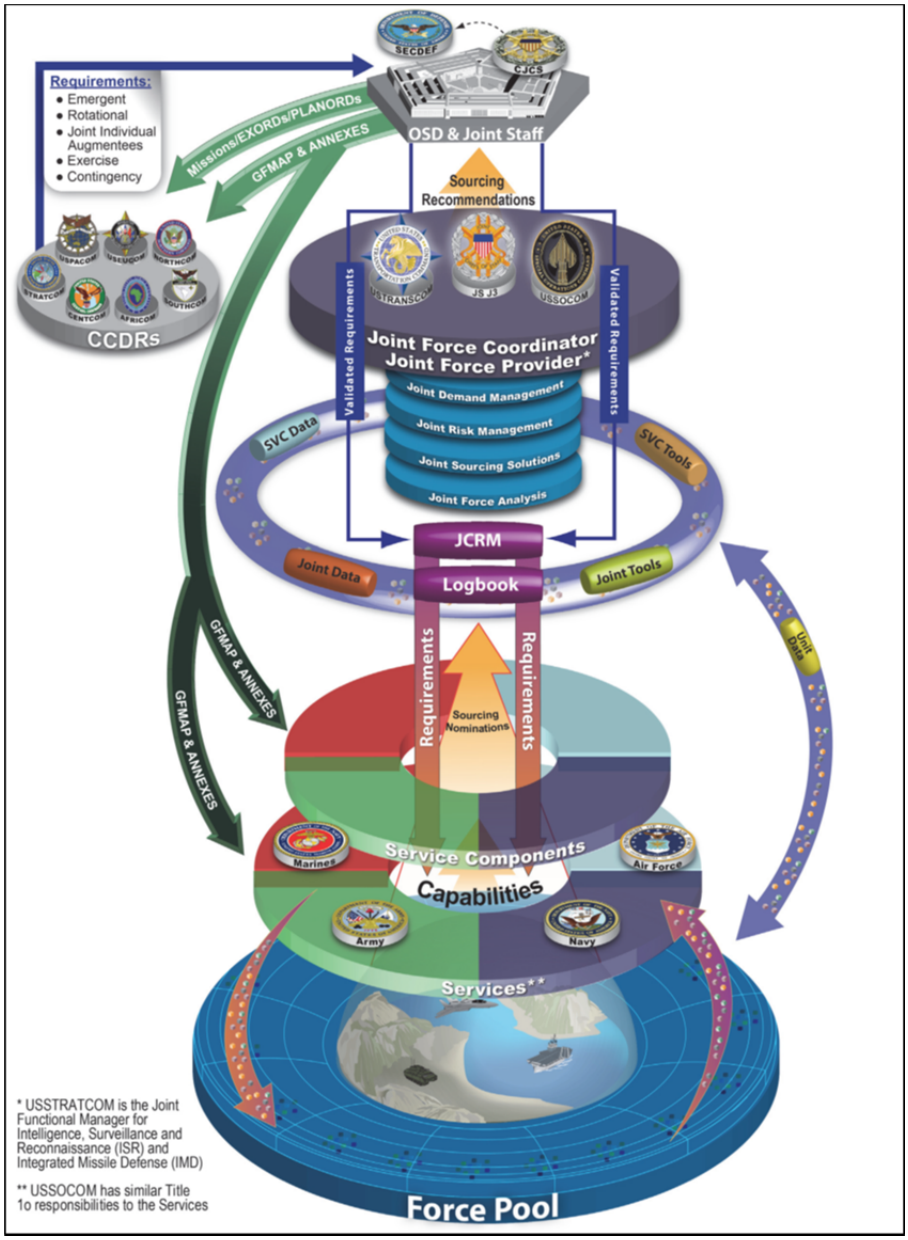

Figure 1. OV-1 Allocation Operational Concept Graphic. Source: Joint Staff (2014).

726 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

This chapter will step through the GFM allocation process and develop an understanding of the GFM process depicted in Figure 1. The allocation process begins when the SECDEF assigns missions and operations to CCDRs. To meet the mission and operations objectives, CCDRs request forces with the capabilities required to achieve mission objectives. For example if a CCDR is required to conduct a strike into a particular area, the CCDR needs to know what and where the targets are. To do that, the CCDR may require an ISR capability such as full motion video to build situational awareness of the battle space. The CCDR will request full motion video as the force requirement.

The GFM process supports both rotational requirements and emergent requirements. Rotational requirements are those operations and missions that CCDRs and Force Providers are able to plan for from fiscal year to fiscal year. For example, to conduct Operation IRAQI FREEDOM (OIF), Commander United States Central Command's (USCENTCOM) strategy requires forces to continue from one fiscal year into the next. USCENTCOM will continue to require ISR capabilities to monitor the situation in Iraq. This plan informs the demand for USCENTCOM's rotational requirements. Emergent requirements are force capabilities needed in addition to the rotational requirements. Emergent requirements happen during the current fiscal year. For example, during the Ebola Crisis in the Commander United States Africa Command (USAFRICOM) Area of Responsibility (AOR), USAFRICOM requested additional medical support capabilities to augment the forces allocated in fiscal year 2014. Emergent requirements typically address the "what's changed?" in a CCDR's AOR within the fiscal year.

The Joint Staff will validate each CCDR's force requirement. Validation includes verifying requirements, assigning a priority, and ensuring the CCDR has the proper authorities to conduct the operation with the requested capability. The Joint Staff as the Joint Force Coordinator (JFC) will assign the Joint Force Provider (JFP) for conventional forces, Special Operations Forces (SOF), or mobility. The JFC and JFP will coordinate with the Air Force, Army, Marines, and Navy, who are the Force Providers (FP) to determine sourcing options to meet the CCDR's requirements. Force providers look

727 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

across the complete spectrum of their Service capabilities and balance the need to meet the requirement with the risk to the impact to Service force readiness. With the high demand for combat forces across the globe continuing since 2011, the risk to Service and Force readiness is the most significant factor in force allocation recommendations to the SECDEF. In many force capabilities, there is no additional capacity to meet all of the CCDR's rotational requirements and emergent requirements without a reallocation of forces. This is the case with intelligence, surveillance, and reconnaissance (ISR) capabilities.

The JFC and JFPs critically review the FP nominations including analyzing risk to develop a recommended joint sourcing solution. The Joint Staff will socialize the recommended sourcing solution to the CCDRs and FPs to accurately address both risk to mission and risk to force impacts in order to inform the SECDEF for force allocation decision. When the FP and/or the CCDR do not agree with a recommendation, the issue becomes contentious. The contentious issue will go through a resolution process consisting of action officer and General Officer/Flag Officer (GOFO) level forums. A requirement becomes contentious for several reasons:

1. The FP does not have the capacity to meet a CCDR's requirement to a satisfactory level.

2. The proposed solution meets the requirement, but it is missing the specific unit type wanted by the CCDR.

3. The CCDR has a valid requirement yet there is no capacity to meet the requirement without reallocation from another CCDR.

4. The recommended solution reallocates existing forces in one CCDR's AOR to a different CCDR.

Situation (4) causes many contentious issues for ISR requirements. ISR capability demand far exceeds ISR capacity. When the force providers have all available forces allocated and there is no additional capacity for emergent requirements, it may be necessary to reallocate forces from one CCDR to another. The Joint Staff makes the recommendation to reallocate the assets, and the SECDEF is the approval authority to reallocate assets from one CCDR.

728 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

The Joint Staff will staff all resource allocation recommendations. Once staffed, the recommendations become part of the draft Global Force Management Allocation Plan (GFMAP). The Joint Staff will staff the GFMAP to the FPs and CCDRs prior to submitting the sourcing recommendations to the SECDEF. The Joint Staff briefs the draft order through the Joint Staff Directorates and the Office of the Secretary of Defense (OSD) to the Chairman of the Joint Chiefs of Staff (CJCS), OSD leadership. When the SECDEF approves the GFMAP, the Joint Staff publishes the GFMAP. The GFMAP is the SECDEF Deployment Order (DEPORD) for all allocated forces.

2. Risk Assessment

The GFM process takes into account military risk and strategic risk. Strategic risk evaluates and judges both the probability and consequence of threats to the nation. The GFMIG defines military risk as risk to mission and risk to force; it uses the terms to express the overall risk associated with fiscal year requirements. Title 10, U.S.C., section 153 requires CJCS annually to "assess the nature and magnitude of the strategic and military risks with executing" National Military Strategy missions.

Risk to mission is the CCDR's ability to execute assigned missions at acceptable human, material, financial and strategic costs. Risk to mission should include the CCDR's assessment of what aspects of the mission will assume risk and for how long. Effective risk to mission assessments includes risk mitigation measures and the impact of those mitigation measures to the mission. In other words, what requirements will not be met and how will that affect meeting mission objectives? This thesis will identify what requirements will not be met.

B. PRIMARY RESEARCH THESIS QUESTION

How do we quantify the tradeoff necessary to reduce contentious decision-making in the Global Force Management allocation process?

This thesis is a proof of concept of an optimization model for ISR allocation within the Global Force Management process. The challenge with the current ISR allocation process is objectively quantifying the reason behind a recommended sourcing solution for ISR global allocation. Current military operations across the globe

729 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

experience more demand from the Geographic Combatant Commanders (GCC) than the Force Providers have assets available to meet the GCC requirements. The Joint Staff, in concert with USSTRATCOM, use many factors to prioritize allocation of assets to include determining which GCC gets the assets and for how long. The decision influencers recommend a resource allocation solution based on experience, force capacity, GCC demand, and the strategic environment provided by guidance from the National Security Council (NSC).

C. BENEFIT OF STUDY

This ISR capability optimization proof of concept will take an ISR capability that the GCCs require such as full-motion video (FMV), and show how the allocation can be optimized to meet requirements across the GCCs. To do understand the complexities of the ISR force allocation, the next chapter will describe the allocation process.

730 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

II. METHODOLOGY

This chapter describes how a Combatant Commander's capability requirement receives a force allocation. The Global Force Management process is explained step-by-step starting with the CCDR's requirement identified. It ends with a force deployed to meet that requirement and it identifies critical decision points. This chapter also describes the additional steps of the ISR allocation process.

A. GFM PROCESS DESCRIPTION

The design of the entire global force management process allows the SECDEF to make risk informed and prioritized decisions for the employment of the force. The product of the GFM process is deployed military forces to the Geographic Combatant Commanders (CCDR). The GFM process in Figure 2 describes how the CCDRs request forces through a request for forces (RFF) through the validation process, and receives force allocation as ordered by the SECDEF. For the purpose of this report, the scope and specifics of the process is unclassified. For ISR requirements, it is common for the issue to become contentious during the resource allocation process. There are not enough ISR assets to meet CCDR requirements (Secretary of Defense 2016). The entire process is to allow the SECDEF to make risk informed decisions for the employment of the force.

1. The GFM process begins with a RFF from the Geographic Combatant Commander. The request is for a capability needed in that GCC's area of operations that does not already exist.[2] An example of a capability request is for ISR full motion video from USEUCOM to monitor the refugee crisis of people leaving Syria across the Mediterranean Sea. The Joint Staff receives the RFF via an electronic message.

2. The Joint Staff verifies that the GCC has the authority for the capability of the RFF requested and the force meets the guidance of provided in Chapter I. When the RFF meets validation requirements, it moves to

[2] Secretary of Defense. 2015. (U) *"Dissemination of the Guidance for the Employment of the Force."* Washington, DC: Department of Defense. This document is classifed SECRET.

731 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

validation. If the RFF does not meet the validation requirements, it returns to the CCDR with requests for more information in order to meet the validation requirements.

3. Decision Point. In validation, the J31 Deputy Director approves or denies the validation of the RFF. Validated RFFs proceed to the resource allocation process. Not validated RFFs return to the CCDR. Some of the reasons for not validating an RFF include but not limited to the following:

   a. The RFF is asking for a validated requirement that already exists.

   b. The RFF is asking for a requirement that does not meet the SECDEF's strategic direction.

   c. The RFF is requesting a relook at sourcing without a significant change in the CCDR strategic situation.

   Validation simply determines if the CCDR has valid SECDEF approved mission with fiscal authority, legal, and that there is not an existing requirement for the same capability (Joint Staff, 2014). Validation does not consider whether the Force Providers have the capacity to source the request. Validated RFFs may or may not have forces allocated. The SECDEF assumes all of the risk to the CCDR for not providing resources to meet the demand when a validated capability lacks resources. This happens when there are not enough forces to meet all of the requests from all of the COCOMs without breaking the force providers' ability to reconstitute forces from year to year and surge capacity to meet emergent requirements. Many ISR RFFs are validated yet do not receive the required resources.

4. The validated RFF is assigned a GEF priority and a request is sent to the Force Providers for force allocation feasibility. With some requirements, multiple services can source the requested capability. For example, the Navy and the Air Force can source ISR—Signals Intelligence (SIGINT) capabilities with the EP-3 Aries and the RC-135 V/W Rivet Joint. A single Service can only source other capabilities. For example, the Navy is obviously the only Service that can provide a maritime presence with a Carrier Strike Group. The Joint Staff as the Joint Force Coordinator, will use the Force Allocation Decision Model (FADM) to prioritize fulfillment

732 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

of requirements.[3] The FADM is guidance that provides a flexibility for making force allocation recommendations among competing requests (Joint Staff, 2014). The details of the FADM are classified. However, the intent of the FADM is to align GFM allocation recommendations with Department of Defense priorities. It is a tiered framework where the higher the FADM priority, the more critical the requirement is to strategic end-states and top priority planning efforts (Joint Staff 2014).

5. Decision Point. The Joint Staff sends the RFF to the appropriate service or services for force allocation recommendations. If the service can meet the request, the service accepts the responsibility to the provide resources to the RFF. If the service cannot meet the requirement, the service must provide the reason including the risk assessment as to why it cannot meet the request. In some cases, the services will agree to provide resources with the capability with some exceptions or comments, which may outline a different unit to meet the same capability.

    a. For ISR requirements, there is an additional step in the process. JFCC-ISR will review the ISR RFF and provide force allocation recommendations to the force providers and the CCDRs through the Joint Staff. JFCC-ISR recommendations use trend analysis of requirements from year to year, service capacity to process the collection, and operational constraints such as basing options, over flight permissions, and command and control architecture limitations (Joint Staff 2014).

6. If the Force Provider has the capacity to meet the requirement, the FP sends the resource allocation recommendation to the Joint Staff. If the force provider cannot meet the requirement, the request returns to the Joint Staff for additional staffing, and the recommended solution is contentious between the Force Provider, the CCDR, and the Joint Staff.

7. The Joint Staff will work with both the force provider and the CCDRs to agree on an acceptable resource allocation solution. During the resolution process, force providers provide force availability data and answer questions to give decision makers a better understanding of why the

[3] Secretary of Defense. 2015. (U) *"Dissemination of the Guidance for the Employment of the Force."* Washington, DC: Department of Defense. This document is classifed SECRET.

733 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

request is not feasible. Additionally, for many RFFs, the questions go back to the CCDRs for amplifying information. The purpose of this step is to resolve the issues with an acceptable solution from the CCDR and the Force Providers at the lowest decision maker level.[4]

7a. Decision Point. The first step in the adjudication process of a contentious issue is at the Action Officer level via a Secure Video Teleconference (SVTC). The required participants include the action officers from the Joint Staff, the GCCs, and the Services. The SVTC is an opportunity for each stakeholder to make the case why the RFF does not have the resource allocation as required by the CCDR. The Joint Staff is the broker of this step in the process. In some cases, the issue is resolved at this level with a negotiated resource allocation for or a formal withdrawal of the RFF from the CCDRs, removing the RFF. If the issue is not resolved and remains a contentious, it is elevated to the One-Star General Officer Flag Officer (GOFO) level.

7b. Decision Point. If unresolved after the action-officer level process, the contentious issue proceeds to a one-star GOFO level SVTC. The required participants include the one-star GOFO from the Joint Staff, each CCDR, and each Service force provider. This SVTC is an opportunity for each stakeholder to make the case why the recommendation does not meet the CCDR requirement. The Joint Staff is the broker of this step in the process. In some cases, the issue is resolved at this level with a negotiated resource allocation recommendation or a formal withdrawal of the RFF from the GCCs, removing the RFF. If the issue is not resolved and remains a contentious, the issue is elevated to the Three-Star GOFO Operations Deputies (OPSDEP) tank.

7c. Decision Point. If there is no resolution by this stage in the process, the contentious issue proceeds to a three-star GOFO Operations Deputies (OPSDEP) tank for resolution. The required participants include the three-star Operations Deputy GOFO from the Joint Staff, each GCC, and each Service force provider. This meeting is an opportunity for each stakeholder to make the case why the recommendation does not meet the

[4] Secretary of Defense. 2015. (U) *Dissemination of the Guidance for the Employment of the Force.* Department of Defense, Washington, DC. This document is classifed SECRET.

734 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

CCDR requirement The Joint Staff is the broker of this step in the process. In some cases, the issue is resolved at this level with a negotiated resource allocation recommendation or a formal withdrawal of the RFF from the GCCs, removing the RFF.

7d. The unresolved issue remains contentious and is elevated to the Four-Star JCS tank. The JCS Tank adjudicates very few RFFs. For example, in fiscal year 2015, one ISR contentious issue went to the JCS for resolution. The specifics of the issue are classified; however, the context of the issue affected the overall force health of the Air Force remote piloted aircraft capability and required the attention and strategic prioritization of the Joint Chiefs of Staff. With a resource allocation decision made for the RFF, a risk to force assessment by the Service and a risk to mission assessment by the CCDR is included in the sourcing recommendation.

8. The Joint Staff compiles the RFFs and the sourcing solutions for SECDEF approval to deploy forces via the Global Force Management Allocation Plan (GFMAP) (Secretary of Defense 2016). The GFMAP authorizes the transfer of and attachment of forces from supporting CCDRs and Secretaries of the Military Departments and attachment to a supported CCDR. If a force allocated to one CCDR is shifted as a force sourcing solution to another CCDR, the CCDR from whom the force is reallocated is not a Force Provider, but must be consulted prior to reallocation.[5] Emergent ISR sourcing solutions often require reallocation across CCDRs due to the lack of overall ISR capacity. Prioritization on which CCDR will lose capability at the expense of another CCDR is an experienced-based subjective decision that would benefit by the implementation of an objective optimization tool set.

9. Decision Point. The Joint Staff briefs the details and the reason for the recommendation to the SECDEF on contentious issues for decision in GFMAP. The brief includes risk to mission and risk to force impacts. The SECDEF will make a risk informed decision to approve or deny each

[5] Secretary of Defense. 2016. (U) *"Global Force Management Implementation Guidance FY2016-2017."* Department of Defense, Washington, DC. This document is classifed SECRET.

735 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

force recommendation in the GFMAP. The SECDEF assumes the risk to the CCDR mission when the allocation solution does not meet the CCDR requirements. The SECDEF assumes the risk to the force when the force allocation is at the expense of the force provider's force readiness.

10. The SECDEF approves the GFMAP and orders the force via the Global Force Management Allocation Plan (GFMAP) (Secretary of Defense 2016).

11. The process ends when the forces sourced deploy to the CCDR's AOR.

B. CURRENT ISR ALLOCATION PROCESS DISCUSSION

The intelligence, surveillance, and reconnaissance force allocation process includes additional steps in the force allocation process. Typically, ISR capabilities such as full motion video (FMV) are in high demand by CCDRs. However, the availability of ISR platforms is severely limited. ISR capability is described as high demand and low density. Because of the ability of ISR platforms to potentially service multiple CCDRs from a common operating location and competing demands for mission critical requirements, the allocation of ISR forces includes close coordination between the Joint Staff, CCDRs, force providers, and the Joint Functional Component Command for Intelligence, Surveillance, and Reconnaissance (JFCC ISR).

JFCC ISR is responsible to the Joint Staff and the Secretary of Defense to recommend the most effective use of the limited number of ISR platforms in support of CCDR objectives. For CCDR ISR requirements, the CCDR develops Concept of Collection Operations (CONOPS). The Global Force Management Allocation Policies and Procedures, CJCSM 3130.06A, direct JFCC ISR to evaluate CCDR ISR CONOPS to establish collection priorities to support of Operations Plans (OPLAN) and Concept Plans (CONPLAN). JFCC ISR analyzes the CONOP and accounts for all ISR requirements against categorized FAM priorities and operations areas. The ISR CONOP includes descriptions that address how all ISR collection assets including CCDR theater assets, national technical means (space-based), and Coalition partner capabilities are integrated to meet intelligence collection requirements.

JFCC ISR's assessment of the ISR CONOPS includes assumptions, operational constraints such as but not limited to aircraft basing options, over flight restrictions, collection processing limitations, C4I architecture limitations, and aircraft availability. The CCDR's ISR CONOPS should include a "what cannot be accomplished" risk statement if the requirements are not sourced or partially sourced. JFCC ISR's force allocation recommendations balance ISR gaps and shortfalls with CCDR priorities and force availability. Additionally, JFCC ISR uses trend analysis for comparing (increasing, decreasing, or steady) the previous fiscal year requirements with the proposed

738 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

requirements for the current fiscal year. The analysis informs force allocation recommendations.

JFCC ISR makes the force allocation recommendation to the Joint Staff after the CCDR have submitted their ISR requirements to the Joint Staff and after the force providers have offered the available assets for allocation. The strategic priority of the FADM and previously described heuristics inform the recommendation. The proof of concept of the ISR allocation optimization model will apply similar heuristics and prioritization factors to inform both the Joint Staff and JFCC ISR in order to provide optimized recommendations to the SECDEF for the allocation of forces. Chapter III will introduce the model's objective function, which is to maximize the number of ISR capability hours provided to meet prioritized Geographic Combatant Commanders requirements.

III. DATA PRESENTATION AND ANALYSIS

This chapter introduces the Global Force Management intelligence, surveillance, and reconnaissance allocation model. This model attempts to maximize the number of hours of ISR capability provided to the Geographic Combatant Commanders in a fiscal year to meet mission objectives. The optimization model uses a mixed integer linear programming formulation.

A. GLOBAL FORCE MANAGEMENT INTELLIGENCE, SURVEILLANCE, AND RECONNAISSANCE ALLOCATION MODEL FORMULATION

1. Indices

i Full Motion Video (FMV) ISR platform type. For the purpose of this model, the following platforms will provide FMV capability to meet CCDR requirements:

- MQ-1B Predator
- MQ-1C Grey Eagle
- MQ-9 Reaper
- P-3C Orion
- Enhanced Medium Altitude Reconnaissance and Surveillance System (EMARSS)

j Combatant Commander with FMV requirements

- United States Africa Command (UAFRICOM)
- United States Central Command (USCENTCOM)
- United States European Command (USEUCOM)
- United States Northern Command (USNORTHCOM)
- United States Pacific Command (USPACOM)
- United Southern Command (USSOUTHCOM)

741 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

2. Parameters and Data

$value_{ij}$ The FADM weighted platform consideration for ISR type *i* provided to CCDR *j*

$capacity_i$ Number of ISR hours available from force provider for platform *i* $\left[\text{hours/day}\right]$

req_j Number of total ISR hours required by CCDR *j* $\left[\text{hours/day}\right]$

lre_i Number of LRE sorties of ISR type *i* available from force provider $\left[\text{sorties/day}\right]$

$lre\_sorties_i$ Number of LRE sorties required to support one ISR type *i* sortie $\left[\text{hours/sortie}\right]$

3. Decision Variables

X_{ij} Number of ISR FMV hours from platform *i*, allocated to CCDR *j* $\left[\text{hours/day}\right]$

Y_{ij} Number of LRE sorties of type *i* allocated to CCDR *j* $\left[\text{sorties/day}\right]$

4. Objective Function

The goal of the ISR FMV allocation optimization model is to maximize the hours of FMV allocated to each CCDR to meet the prioritized mission requirements.

$$MAX\ Z = \sum_{ij} value_{ij} X_{ij} \qquad (1)$$

5. Constraints

$$\sum_{j} X_{ij} \le capacity_i \quad \forall i \qquad (2)$$

Constraint (2) ensures that the ISR sorties allocated to all CDDRs do not exceed force provider's capacity.

$$\sum_{i} X_{ij} \doteq req_j \quad \forall j \qquad (3)$$

742 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

Elastic constraint (3) ensures CCDR each type ISR platform requirements are met if possible.

$$X_{ij} \leq lre\_sorties_i Y_{ij} \quad \forall i, j \qquad (4)$$

Constraint (4) ensures that LRE are allocated to support ISR platform sorties when required.

$$\sum_j Y_{ij} \leq lre_i \quad \forall i \qquad (5)$$

Constraint (5) requires that LRE sorties allocated to all CCDRs do not exceed the force provider's capacity.

$$X_{ij} \geq 0 \quad \forall ij \qquad (6)$$

Constraint (6) states that ISR FMV allocation hours must be non-negative.

$$Y_{ij} \equiv \text{integer} \quad \forall ij \qquad (7)$$

Constraint (7) enforces integer restrictions on all LRE platform decision variables.

This chapter introduced the equations that build the model. Chapter III goes into detail about the indices, parameters, and constraints that influence the objective function. It describes how the model is developed and discussions the assumptions used.

IV. DATA, RESULTS, AND ANALYSES

This chapter describes in detail the indices, parameters, and constraints introduced in Chapter III using notional data and the assumptions made in the model development. The notional data provides results and informs the analysis of the model influenced by FADM and platform type. This chapter describes the analyses of the results. The model was solved using Microsoft Excel with Solver add-in.

A. HYPOTHETICAL DATA AND DEVELOPMENT

The ISR allocation optimization model applies to any of the ISR requirement capabilities, including but not limited to Full Motion Video (FMV), Signals Intelligence (SIGINT), Communications Intelligence (COMINT), and other intelligence collection capabilities. The complexity of FMV force allocation makes FMV the ideal capability to use for a proof of concept. FMV is real-time video imagery used for intelligence collection (Lockheed Martin 2016). For the purpose and scope of this thesis, FMV will be limited to airborne platforms. It does not include space-based imagery systems.

FMV is critical to the war fighter. It provides CCDRs real-time pattern of life of the battle space. It is one piece of the intelligence information puzzle. FMV combined with satellite imagery such as Google Earth and electronic warfare data provides decision makers the situational awareness required to meet mission objectives (C4ISRNET 2016). Figure 3 is a snapshot of one image of FMV. As a still image, it shows three vehicles in a single-file line along a road. Using FMV as a stream of video imagery over time, it provides point of origin of this group of vehicles and ultimate destination of these vehicles. Knowing where the trucks came from helps decision makers to distinguish if the vehicles are friendly, hostile, or potentially hostile forces on the move. This is an oversimplified example of the potential of FMV that illustrates how critical maintaining awareness of the operating area is to CCDRs. FMV combined with an armed platform allows for the rapid engagement of a time-critical target. FMW is a critical requirement to meet CCDR objectives and strategic priorities.

745 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

Hypothetical data is used to keep this thesis unclassified. The platform capabilities come from a small sampling of ISR FMV platforms that have sufficient open-source information to make the model relevant. The hypothetical CCDR requirements are derived from and loosely based on historical data from GFMAP force allocations. Actual CCDR requirements, force capacities, and FADM priorities are classified. The model uses a methodical approach using known data and informed assumptions to develop reasonable scenarios to implement in the model.

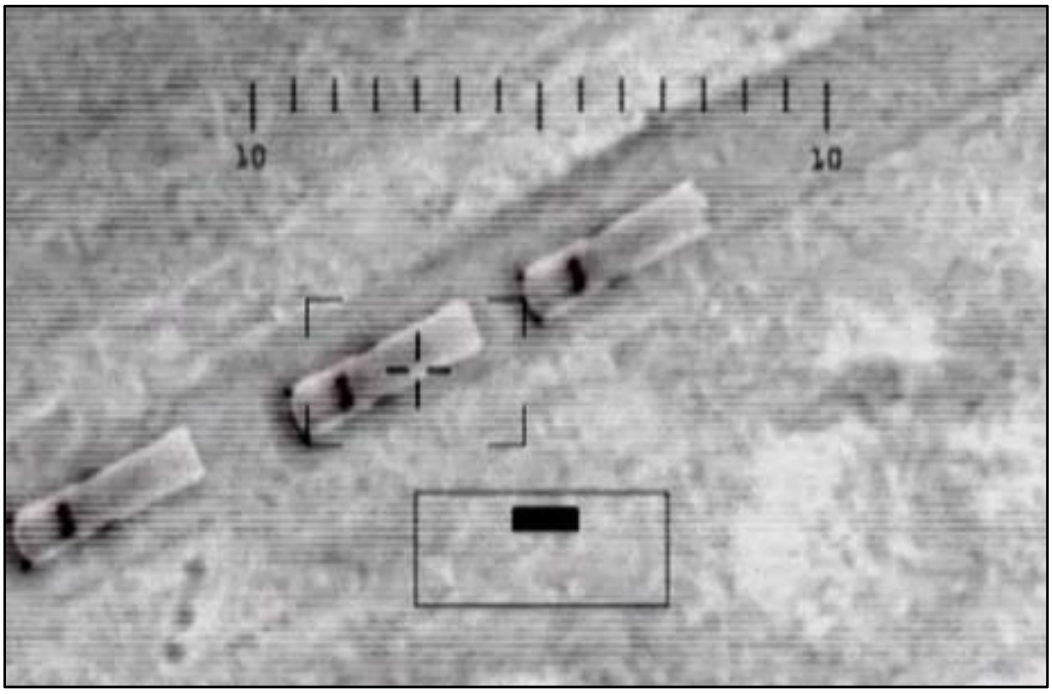

Figure 3. Full Motion Video (FMV) Example.
Source: Lockheed Martin (2016).

B. FORCE ALLOCATION MODEL DISCUSSION

This section describes in detail the formulation of the optimization model. It describes the indices of ISR platform types and CCDR requirements. The key to the understanding the optimization formulation is in the understanding of how the parameters are defined. The parameters are a combination of known objective data such as the force provider capacity of a specific platform, and an attempt to quantify heuristic data such as the importance of a particular platform type to a specific CDDR requirement.

746 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

Understanding how the parameters effect the optimized solution informs the decision influencers to which parameters influence the formulation the most. The impact is useful to the force provider, the CDDR, and the Joint Staff. The force provider may use the data to apply additional funding to the area that has the most significant gains. The force provider can also use the data to identify areas that present a risk to force and inform the decision to determine if there are significant gains to meeting CCDR requirements while accepting additional risk to force. For CCDRs, this shows objectively where the CCDR has determined how important a requirement is and how that same importance influenced the resource allocation. By looking at the results, the CCDR can see where their requirement priorities are evaluated globally across all of the CCDR's requirements. The Joint Staff can evaluate the data to verify that the results support the military objectives of the National Military Strategy. The Joint Staff can use the formulation to run recommendation scenarios to model where largest gains from risk to force and risk to mission can be made. The information can influence recommendation to the SECDEF to order a force provider to provide additional assets at the expense of long-term force readiness. This optimization model provides transparency that is not easily interpreted or understood in the current ISR force allocation process.

1. Indices

a. Full Motion Video Platform Types

The optimization model uses a sampling of FMV capable aircraft to prove the concept. Although there are many FMV capable aircraft, the aircraft types selected include platforms from each Service that have allocable ISR aircraft. The selection includes manned and remotely piloted aircraft to show that the optimization model reflects current capabilities and that it can adapt to reflect future capabilities.

(1) MQ-1B Predator

The MQ-1B Predator is a remotely piloted reconnaissance aircraft built by General Atomics Aeronautical System Inc. The United States Air Force is the force provider for USAF MQ-1B Predators. A Predator system includes four aircraft, a ground

747 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

control station, operators, and maintenance to support 24-hour missions anywhere in the world (Air Combat Command 2015). Pilots at the ground control stations fly the aircraft using data-link.

An MQ-1B carries a full motion video imaging sensor. It can either armed or unarmed with two laser-guided air to ground AGM-114 Hellfire missiles (Air Combat Command 2015). The aircraft has a range of 770 miles (Air Combat Command 2105). The combination of persistent FMV and air to ground armament allow the CCDR capability to engage time critical targets.

Figure 4. MQ-1B Predator (U.S. Air Force photo/Staff Sgt. Brian Ferguson). Source: Air Combat Command (2015).

(2) MQ-1C Gray Eagle

The MQ-1C Gray Eagle is an unmanned aircraft system built by General Atomics Aeronautical System Inc. The United States Army is the force provider for USA MQ-1C Grey Eagles. The Army deploys the Grey Eagle platoon as part of the Combat Aviation Brigade. Four aircraft, two ground control stations and terminals, one portable ground

748 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

control station, communication equipment, ground support equipment, and 127 people make up one Gray Eagle platoon (United States Army 2016).

The Gray Eagle can carry an electro-optical sensor and up to four AGM-114 Hellfire missiles that provide FMV and strike capability to the CCDR (General Atomics Aeronautical 2016). The MQ-1C has a 2,500 miles range and an endurance profile of 27 hours (United States Army 2016). Q-1C Grey Eagle (General Atomic photo). Source: (General Atomics Aeronautical 2016)

Figure 5. MQ-1C Grey Eagle. Source: United States Army (2016)

(3) MQ-9 Reaper

The MQ-9 Reaper is a remote-piloted aircraft built by General Atomics Aeronautical Systems. The United States Air Force is the MQ-9 force provider. The MQ-9 Reaper provides combined FMV and strike capability against time-sensitive targets (Air Combat Command 2015). Reaper aircraft use multiple types of imaging sensors to provide full motion video capability (United States Air Force 2015). Like the MQ-1C, the MQ-9 can carry up to four AGM-114 Hellfire in addition to the FMV sensors.

749 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

The MQ-9 units have four aircraft, a ground control station, and communication equipment. The 1,150 miles aircraft range is significantly more than the range MQ-1B Predator (United States Air Force 2015). In some cases, CCDR prefer the MQ-9 Reaper to the MQ-1B Predator due to the additional range and armament capacity of the Reaper platform.

Figure 6. Armed MQ-9 Reaper (U.S. Air Force Photo / Lt. Col. Leslie Pratt). Source: Air Combat Command (2015).

(4) P-3C Orion

The P-3C Orion is a U.S. Navy full motion video capable patrol aircraft built by Lockheed Martin (Lockheed Martin 2016). The P-3C Orion is a manned aircraft with multiple sensors including surface search radar and electro-optical real time video cameras. The P-3C Orion can be armed with AGM-84 Harpoon, AGM-84K SLAM-ER, AGM-65F Maverick missiles, Mk46/50/54 torpedoes, rockets, and mines (United States Navy 2016). The Orion has a range of 1,548 miles and an endurance of more than 12 hours (Janes IHS 2016). Unlike the remote piloted MQ-1B, MQ-1C, and the MQ-9 aircraft, the P-3C is a manned aircraft that can use on board real time video processing of

750 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

FMV to prosecute targets on the ground (Lockheed Martin 2016) . Additionally the P-3C Orion has the capability to deliver anti-ship and anti-submarine ordnance to meet specific over water CCDR requirements.

Figure 7. P-3C Orion, captured by U.S. Navy Photo/Photographers Mate 2nd Class Elizabeth L. Burke. Source: United States Navy (2016).

(5) Enhanced Medium Altitude Reconnaissance and Surveillance System

The Enhanced Medium Altitude Reconnaissance and Surveillance System (EMARSS) is an United States Army ISR aircraft capable of providing FMV. EMARSS is an example of a successful Army program of record program that is taking former U.S. Air Force Liberty C-12 aircraft and integrating them into the Army EMARSS program (United States Army 2016). EMARSS and programs like it, are getting ISR capabilities to the warfighter through rapoid acquisition authority (United States Army 2016). The number and types of platforms in the optimization model can expand and include new or adpated technologies such as EMARSS.

751 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

Figure 8. U.S. Army Enhanced Medium Altitude Reconnaissance and Surveillance System. Source: United States Army (2016).

b. Combatant Commanders

The Unified Command Plan of the United States divides the world into geographic regions and assigns responsibilities to geographic combatant commanders. Figure 3 illustrates the geographic division by CCDR.

(1) United States Africa Command

United States Africa Command (USAFRICOM) is responsible for the Unites States interests in Africa. It builds and strengthens military relations with African countries and the African Union to increase security and counter transnational threats (U.S. Department of Defense 2011).

752 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

(2) United States Central Command

United States Central Command (USCENTCOM) is responsible for United States military operations in 20 countries including Afghanistan, Bahrain, Egypt, Iran, Iraq, Jordan, Kazakhstan, Kuwait, Kyrgyzstan, Lebanon, Oman, Pakistan, Qatar, Saudi Arabia, Syria, Tajikistan, Turkmenistan, United Arab Emirates, Uzbekistan and Yemen. The mission of USCENTCOM is increasing stability in the region through international partnerships (U.S. Department of Defense 2011).

(3) United States European Command

United States European Command (USEUCOM) is responsible for building and maintaining military partnerships with European, Middle Eastern, and Eurasian nations, including the North Atlantic Treaty Organization (NATO) to increase the security in EUCOM's area of responsibility (U.S. Department of Defense 2011).

(4) United States Northern Command

United States Northern Command (USNORTHCOM) is responsible for continental United States, Alaska, Mexico, Canada, portions of the Caribbean and surrounding waters. It also oversees the North American Aerospace Defense Command (NORAD).

(5) United States Pacific Command

United States Pacific Command (USPACOM) has the largest geographic area of responsibility including 36 nations and the waters of the United States west coast extending to the western border of India, and from Antarctica to the North Pole (U.S. Department of Defense 2011). USPACOM builds and fosters military partnerships to enhance security in the region.

753 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

(6) United States Southern Command

United States Southern Command (USSOUTHCOM) is responsible for an area of 31 nations in Latin America, Central America, South America, and the Caribbean Sea. USSOUTHCOM's security efforts include promoting human rights, to deter illegal illicit trafficking and conducting multinational military exercises that build and foster partnerships (U.S. Department of Defense 2011).

Figure 9. Commander's Area of Responsibility.
Source: U.S. Department of Defense (2011).

(7) Combatant Commander Prioritization Factor Discussion

When implementing the optimization model, it is important for decision influencers to distinguish when force allocations are exclusively weighted and factored to FADM priority. For example: NORTHCOM has the responsibility to defend the United States (U.S.) against attacks to the U.S. homeland. Due to the consequences of the effects

754 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

if the U.S. is attacked, USNORTHCOM may have the highest FADM priorities for many of its requirements. However, the resource allocation may need to be balanced to provide ISR assets to a CCDR that is actively engaged in combat operations. At the time of writing this thesis, the U.S. is involved in large-scale combat operations in USCENTCOM and USAFRICOM areas of responsibility.

In further development of this model and refining the factors that influence the optimization, a refinement of how priority will factor into the risk to potential OPLANs, versus the risk to ongoing combat operations will make the optimization model more relevant.

2. Parameters

a. $value_{ij}$

The $value_{ij}$ parameter is a numerical value assigned to the priority for sourcing of each requirement of CCDR *j* by platform *i*. It is based on a prioritization derived from FADM and platform considerations. The higher the FADM priority assigned by the Joint Staff, the larger the value that will applied to the requirement in the model. The actual is FADM is classified. Table 1 is an unclassified notional example of how the FADM priority is weighted with a value. A FADM of 1.1.1 has the highest priority and weighted the most. Assigning a weight factor to FADM priority enables the objective formula to allocate FMV capability to CCDR requirements that have the highest priority. According to the fiscal years 2015 and 2016 Global Force Management Allocation Plan, this is not the case (Secretary of Defense 2015; 2016). CCDRs prioritize against what they want. Not necessarily optimized against the FADM priorities. In this model, the highest FADM must receive some sourcing before lower FADM requirements.

755 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

Table 1. FADM Priority and Weight Factor

FADM	Weight Factor	FADM	Weight Factor	FADM	Weight Factor
1.1.1	100	2.1.1	60	3.1.1	30
1.1.2	99	2.1.2	59	3.1.2	29
1.1.3	98	2.1.3	58	3.1.3	28
1.1.4	97	2.1.4	57	3.1.4	27
1.1.5	96	2.1.5	56	3.1.5	26
1.1.6	95	2.1.6	55	3.1.6	25
1.1.7	94	2.1.7	54	3.1.7	24
1.2.1	93	2.2.1	53	3.2.1	23
1.2.2	92	2.2.2	52	3.2.2	22
1.2.3	91	2.2.3	51	3.2.3	21
1.2.4	90	2.2.4	50	3.2.4	20
1.2.5	89	2.2.5	49	3.2.5	19
1.2.6	88	2.2.6	48	3.2.6	18
1.2.7	87	2.2.7	47	3.2.7	17
1.3.1	86	2.3.1	46	3.3.1	16
1.3.2	85	2.3.2	45	3.3.2	15
1.3.3	84	2.3.3	44	3.3.3	14
1.3.4	83	2.3.4	43	3.3.4	13
1.3.5	82	2.3.5	42	3.3.5	12
1.3.6	81	2.3.6	41	3.3.6	11
1.3.7	80	2.3.7	40	3.3.7	10

This table is an example of how notional FADM priority assigns a weight factor used in the $value_{ij}$ parameter for each requirement. The FADM weight factor represents the "global" tradeoffs made between the competing CCDR requirements.

756 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

FADM is not the only factor that influences $value_{ij}$. In this model, each CCDR requirement is further categorized into platform *i* to allow platform consideration to influence the objective function. Equation (8) shows that FADM weight factor is multiplied across each CCDR's platform considerations. The platform consideration factor for CCDR $_i$, $scale_i$, determines to what extent the objective function is influenced by specific platform preferences for each requirement. The Joint Staff and JFCC ISR with the CCDR determine the platform consideration factor for each requirement.

$$value_{ij} = \sum_i W_i(scale_i) \quad \forall j \qquad (8)$$

Where,

W_i = FADM weight factor

$Scale_i$ = platform consideration factor

Table 2 illustrates how notional CCDR requirements affect $value_{ij.}$ For example, USAFRICOM requirement number 118003 shows that any FMV platform is suitable by having a multiplier of 1 for each platform except MQ-9. The MQ-9 notional multiplier is 1.1, meaning the MQ-9 is preferred. As a result, the $value_{ij}$ for that requirement is influenced accordingly.

In another example, USCENTCOM requirement number 218003 has 0 as a multiplier to each platform except the P-3C AIP which is 1. This means that the preferred platform to provide capability to that requirement is the P-3C AIP.

757 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

Table 2. Example of $value_{ij.}$ Table for Model Calculations

	USAFRICOM			USCENTCOM

The columns contain the CCDR capability requirements. The grey rows contain the capability requirement. The light blue rows represent the FADM weight factor. The yellow rows beneath the weight factor contain the platform consideration factor. The dark blue rows represent $value_{ij}$ computed using Equation (8).

b. $capacity_i$

The $capacity_i$ parameter is the Number of ISR hours available from force provider for platform *i*. Provided by force provider in units of number of sorties per month for each platform type. The sorties per month are converted to sorties per day then the units are converted to hours per day for the model using the unclassified notional planning factors.

c. req_j

The req_i parameter is the numbers of ISR capability hours required by CCDR j. CCDRs provide requirements in units of hours per month of a specific capability. For this model, the unit of measurement of the capability converts from hours of FMV required per month to per day. The CCDR does not specify a particular platform such as MQ-9 or EMARSS. The requirement is for capability (Secretary of Defense 2016).

758 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

d. lre_i

The lre_i parameter is the number of Launch and Recovery Elements (LRE) of ISR type *i* available from force provider for platform *i*. MQ-1B and MQ-9 each require a LRE to support the takeoff and landing of each sortie. An LRE is platform specific. For example, a MQ-1B LRE can only support MQ-1B sorties. It cannot support MQ-9 sorties. The force provider can only support a limited number of LREs. The number of LRE crews that can operate each LRE at the location combined with the number of systems that can control the aircraft set the LRE capacity limit. Additionally, each LRE has a maximum number of sorties that a single LRE can support. For the purpose of this model, the number of sorties each LRE can support is five sorties per day for each platform type. The LRE parameter in this model only applies to MQ-1B and MQ-9. The Air Force is the force provider for the LREs and sets the limit to both how may LREs are available for force allocation and how many sorties each LRE can support. The LREs deploy to the location from where the MQ-1B and MQ-9 sorties take off and land.

e. cap_lre_i

The cap_lre_i parameter is the number of sorties per day that each LRE of platform type *i* can support.

f. $lre\_sorties_i$

The $lre\_sorties_i$ parameter is the numbers of sorties per day that support ISR of type *I* available from force provider. The Force Provider sets the total number of sorties that flown each day in support of CCDR. The number of Remote Piloted Aircraft (RPA) pilots, RPA sensor operators, and the Process, Exploitation, and Dissemination (PED) capacity available limit the number of RPA sorties available for allocation. Each sortie requires aircraft, RPA pilot crew, RPA sensor operator crew, and PED crew.

g. $collect_i$

The $collect_i$ parameter is the number of hours of ISR type *i* collection per sortie. JFCC ISR and the force provider determine the sortie length for the number of collection hours each aircraft can support.

759 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

3. Decision Variables

a. X_{ij}

X_{ij} is the number of ISR FMV hours from platform *i* allocated to CCDR *j*. The units convert from hours per month to hours per day to simplify conversion to sorties per day to align with the sortie per day limitation set by the force provider.

b. Y_{ij}

Y_{ij} is the number of LRE sorties of type *i* allocated to CCDR *j*. The units convert from hours per month to sorties per day to align with the sortie per day limitation set by the force provider.

4. Objective Function

The goal of the ISR FMV allocation optimization model is to maximize the hours of FMV allocated to each CCDR to meet the prioritized mission requirements. The optimization model uses a mixed integer linear program formulation.

$$MAX\ Z = \sum_{ij} value_{ij} X_{ij} \qquad (1)$$

C. CONSTRAINTS

1. Sourcing Capacity Constraints

To maximize the utilization of a limited number of assets, each CCDR's requirement is equal to or greater than the sourcing recommendation. The optimized solution will not provide a CCDR more allocation of resources than what the requirement demand is.

$$\sum_{j} X_{ij} \le capacity_{i} \quad \forall i \qquad (2)$$

Constraint (2) ensures that the ISR sorties allocated to all CDDRs do not exceed force provider's capacity. However, the goal of the model is to try and allocate resources to meet and satisfy each CCDR requirement. The requirements exceed capacity. This

760 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

makes the model infeasible. To make the model feasible an elastic variable constraint (3) is applied.

$$\sum_i X_{ij} \doteq req_j \quad \forall j \qquad (3)$$

Elastic constraint (3) ensures CCDR each type ISR platform requirements are met if possible.

2. Launch and Recovery Element (LRE) Constraints

$$X_{ij} \le lre\_sorties_i Y_{ij} \quad \forall i, j \qquad (4)$$

Constraint (4) ensures that LREs are allocated to support ISR platform sorties when required.

$$\sum_j Y_{ij} \le lre_i \quad \forall i \qquad (5)$$

Constraint (5) requires that LRE sorties allocated to all CCDRs do not exceed the force provider's capacity.

3. Nonnegativity Constraint

$$X_{ij} \ge 0 \quad \forall ij \qquad (6)$$

Constraint (6) states that ISR FMV allocation hours must be non-negative.

4. Integrality Constraint Integrality Constraint

$$Y_{ij} \equiv \text{integer} \quad \forall ij \qquad (7)$$

Constraint (7) enforces integer restrictions on all LRE platform decision variables.

D. MODEL RESULTS AND ANALYSIS

This section discusses the results of the Global Force Management Intelligence, Surveillance, and Reconnaissance Allocation model. The model allocates forces to meet the most requirements using the objective function. The first sub-section describes how penalties are applied to the objective function to manage the trade-off between LRE constraints and CCDR requirement constraints. The second sub-section describes the model results of keeping the $value_{ij}$ parameter constant across all of the CCDR requirements and only applying FADM as the priority. The third sub-section describes the results of the model after adding CCDR platform consideration to each requirement. Both scenarios use the same twenty CCDR requirements and same the force provider capacities. The requirements are notional. Seven of the requirements have the same FADM priority to simulate the complexity of c CCDR's competing priorities.

1. Objective Function

The objective function (1) shows how FADM and platform consideration influences the model solution.

$$MAX\ Z = \sum_{ij} value_{ij} X_{ij} - \sum_{ij} (LRE\_penalty) Y_{ij} - \sum_{ij} (value_{ij}\_penalty)(elastic\_variable)$$

Breaking down the objective function into its three parts shows how the LRE_penalty and the value_penalty affect the model.

$$\sum_{ij} value_{ij} X_{ij}$$

The sum of the product of $value_{ij}$ * X_{ij} in the objective function encourages the model to maximize the resource allocation to the requirements that give have the highest value. The $value_{ij}$, is influenced by FADM priority and platform consideration. The parameter $value_{ij}$ is the weight factor applied to the requirement. The higher the $value_{ij}$, the more the model will allocate forces to those requirements.

762 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

$$-\sum_{ij}(LRE\_penalty)Y_{ij}$$

Subtracting the sum of the product of the LRE_penalty * Y_{ij} in the objective function ensures that an LRE is only allocated when necessary. A penalty factor influences when it is necessary to allocate a LRE. To minimize the penalty and drive force allocation efficiency, the LRE_penalty maximizes the number of sorties at each LRE. In implementing the model, the LRE_penalty can be manipulated to influence how easy it is for the model to allow an LRE allocation. The greater the penalty factor, the less likely the formula model will allocate an LRE to a requirement. The lesser the penalty factor, the more likely an LRE will be allocated to each requirement

The objective function must balance the LRE_penalty with the overall intent. In this scenario CCDR's requirements are greater than the total ISR FMV capacity. Requirements need all of the available capacity allocated to CCDR requirements and we want to maximize the number of sorties that each LRE supports. If the LRE_penalty is set too high, the objective function will not allocate LREs to the requirements. If the penalty is set too low, LREs are allocated without maximizing the efficiency in the number of sorties that each LRE can support.

$$-\sum_{ij}(value_{ij}\_penalty)(elastic\_variable$$

Lastly, subtracting the sum of the product of $value_{ij}$_penalty and its associated elastic variable ensures feasibility through the elastic constraint of equation (3). The $value_{ij}$_penalty is the trade-off between FADM priority and CCDR's platform preference, as represented by the platform preference factor. The higher the $value_{ij}$_penalty, the greater the FADM priority influences the optimized solution. The lower the $value_{ij}$_penalty, CCDR platform preference priority influences the optimized solution.

763 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

2. Base Model—FADM Prioritized Results

As decision influencers, may want to provide an optimized recommendation strictly based on FADM priority agnostic to the consideration of the type of platform to meet each requirement. This scenario assumes any of the FMV ISR platforms can equally meet the capability requirement. Using the data developed in the previous sections, this subsection presents the initial or *base* model results. The lower chart in Table 3 shows that the model allocates one-hundred percent of the force provider capacity. However, only 902 hours per day of the 1902 hours per day requirement are allocated. This means that 47 percent of the CCDR requirement is satisfied.

The highest thirteen FADM requirements receive FMV capacity. Twelve of those 13 requirements are fully allocated resources. Requirement number 218005 is the next highest FADM priority of 1.3.1, with a FADM weight factor of 86. As shown in Table 3 of the Hours Allocated row, the model allocates 39 hours per day.

Implementing a FADM prioritized model can inform decision makers by providing a solution that shows how forces could be allocated if the objective function is strictly enforcing GEF direction. With fewer assets available than CCDR requirements demand, this method will also show the capability gaps in force allocation. For the force providers and DOD budget personnel, the gaps highlight areas where additional resources can be committed to meet strategic objectives. Although a clearly prioritized optimization model is useful for planning purposes, it does not reflect the reality of ISR FMV force allocation. In fiscal years 2015 and 2016, the SECDEF ordered force allocation was not exclusively based on FADM priority (Secretary of Defense 2015; 2016). The GFMAP considered several additional factors including emerging strategic goals, domestic and international politics, and force provider readiness.

3. CCDR Platform Consideration Sensitivity Analysis

Combatant Commanders have the best insight to what specific platforms can best meet their requirements. However, coordination is required that looks across the whole ISR enterprise for capabilities. JFCC ISR is responsible for providing that coordination. For example, a partner nation may not allow remotely-piloted aircraft flown from their country. In order to mitigate those external factors and meet the mission requirement, the CCDR or JFCC-ISR may prioritize a manned platform type. Additionally, certain platforms are better equipped for particular missions. This section conducts some sensitivity analysis by changing input data from our base model presented in section IV.D.2.

With no other changes to the base model, Table 4 shows how sensitive the model is to a change of $value_{ij}$ parameter for a particular platform. This change may represent when the platform consideration is modified based on new information or just to examine model sensitivity. In this example, the scale associated with requirement number 218003 changes for ISR platforms of EMARSS and P-3 AIP from 1 to 1.5 and which results in a change in the associated *scales* for remotely piloted aircraft to 0.5 from 1. The associated $value_{ij}$ changes from 91 to 136.5 and from 91 to 45.5 for the manned and remotely piloted aircraft, respectively. These changes simulate the preference for manned ISR platforms to meet the 218003 requirement.

767 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

The last row of Table 4 shows that the model allocates FMV capability to the fourteen highest FADM priority requirements. Twelve of the fourteen requirements receive 100 percent allocation. Requirement number 218003 and 218006 receive partial allocation. Requirement number 218006 has a FADM priority of 1.3.3 and a value, or objective function coefficient, of 84. It is the next lowest FADM prioritized requirement and the last requirement to receive the equivalent of 36 percent of its FMV requirement. Requirement number 218003 has a FADM priority of 1.2.3 and a value of 91. It received 29 percent (212 of 727 hours per day) of its requirement. The results show that the platform consideration $scale_i$ of 1.5 for manned aircraft for this requirements received some allocation, but at the expense of overall allocation of FMV ISR, because the change of remote piloted platform consideration *scale* to 0.5 resulted in no FMV capability for that requirement. The MQ-1B, MQ-1C, and MQ-9 capacity was allocated to lower FADM priority requirements (e.g., requirement number 218005), because the value of 86 is more than twice the value of 45.5 for which requirement number 218003 receives for one hour of FMV.

The objective function manages the trade-off between FADM priority and platform consideration. Table 5 illustrates how FADM influences the objective function to a greater extent than platform consideration does. Using the same data illustrated in Table 4, in addition to changing the platform consideration of requirement number 418002 from 1 to 1.5, the objective function did not allocate any MQ-1B or MQ-1C capability to fulfill this requirement.

Requirement number 418002 in Table 5 shows that FADM influences allocation trade-off more than platform consideration.

769 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

Combining and balancing FADM and platform consideration into the optimization model allows decision makers a model that more closely resembles current allocation methods. This result is expected because the $value_{ij}$ parameter is made up of two components, the platform consideration (i.e., the $scale_i$, and FADM weight W_i). The first represents the returns to scale or consideration for a particular platform and the second represents the tradeoff among the different requirements. In other words, the former provides the regional focus to a specific geographic area or preference and the later provides more of a global influence that balances strategic priorities across all of the CCDRs.

As this chapter has shown, this model highlights the areas where there may be trade-space for additional allocation opportunities, which may not be apparent using the current process outlined in Chapter II. For example, if the only means to provide capability to a specific ISR requirement is allocating manned aircraft, the model will show what requirements will be affected to meet that limitation. Additionally, by interpreting the results, the CCDR can assess where their requirement priorities are evaluated globally across all of the CCDR's requirements. The Joint Staff can evaluate the data to verify that the results support the military objectives of the National Military Strategy. If the results do not support the strategic objectives, then the CCDR priorities and the force provider capacity must be scrutinized to mitigate the capability and requirement gaps. The impact implications are important to the Combatant Commanders for mitigation options and important to the SECDEF for accepting the risk associated with the recommendation.

770 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

V. RECOMMENDATIONS AND CONCLUSION

This thesis critically examines the Global Force Management allocation process and the factors that influence it. With the insight gained to the process, this proof of concept applies a methodical optimization formulation to a complex ISR force allocation problem that is complicated by significantly less capacity than demand. This optimization model and its methodology developed as part of this thesis uses full motion video capability and notional requirements to model the applicably of optimization, but may be easily generalized for use in other ISR capabilities (e.g., COMINT, in the Global Force Management allocation process). The data and platforms will differ; however, the basic optimization formulation will be the same.

The base model only considered FADM for allocation prioritization. Results show that with only 902 hours per day of FMV capacity to meet 1902 hours per day of requirements, the optimized solution provided 100 percent of the requirement capability to 12 of the 20 CCDR requirements. Additionally, the model provided a partial allocation of 39 hours per day or nine percent of the requirement to the single next lowest FADM priority requirement. These results are useful to inform senior decision makers within the DOD of which requirements will not receive a capability allocation. The results can be compared against the actual Global Force Management Allocation Plans to highlight which lower FADM priorities are actually receiving a force allocation. The differences can show a strategic misalignment between CCDR priorities and global strategic priorities. For force providers and DOD budget personnel, the gaps highlight areas where additional resources can be committed to meet strategic objectives.

Combining and balancing FADM and platform consideration into the optimization model allows decision makers a model that more closely resembles current allocation methods. The results of the combined model change if the objective function coefficient is modified (i.e., the $value_{ij}$ parameter) for a particular platform. This change may represent where the platform consideration is modified based on new information or just to examine model sensitivity. The objective function manages the trade-off between FADM priority and platform consideration. The combined model closely simulates how

771 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

the force allocations recommendations are made because it takes into account regional geographic realities while managing global strategic priorities.

The research, methodology, and analyses presented successfully prove that this optimization model will objectively inform senior decision makers in the Department of Defense for intelligence surveillance reconnaissance Global Force Management allocation.

772 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

VI. FUTURE RESEARCH

The next iteration (and a separate thesis project) would be the refinement of this model to consider risk. Risk to mission is assumed by the prioritization inherent in the FADM. The force provider assumes risk to force in the force offering. These assumptions are a good start to rotational fiscal year force allocation. However, the model can be adapted to include a risk value. For example, if the Joint Staff or JFCC ISR recommend that a force provider increase capacity to beyond what was initially offered, it would be useful to account for risk to force specifically in the formulation.

Risk can be considered in the model using a multi-objective formulation and adding risk as a consideration in the formulation. For this method to work, the model will assume that $value_{ij}$ is much greater than risk and will ignore risk initially. Then use the model to solve for $value_{ij.}$ Finally, the model will use the solution for $value_{ij}$ to establish an additional constraint and solve for $risk_{ij}$. The model's objective is to compare the risk to force of adding capacity at the expense of future force readiness against the risk to mission of the CCDR for not meeting a capability requirement.

A risk informed model would become the basis for an optimization model that can address emergent requirements. Emergent requirements are CCDR requirements for forces within the current fiscal year. As this notional model shows, all of the force provider capacity is used. In order to allocate additional capability to new requirements, the forces would come from one of three options.

The first option would be to order additional capacity from the force providers. This option comes with a cost to future force readiness. For example, if the recommendation is that the Air Force to provide additional MQ-9 capacity, the additional qualified pilots and sensor operators needed may come from the training units. Pulling instructors from the training unit to meet the demands of operational requirements reduces the number people who are able to train the next cycle of crews. This may have significant impact to follow on rotational capacity. The risk to force would become the significant factor to the model.

773 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

The second option would recommend the reallocation of additional capacity from one CCDR to a different CCDR. For example, USNORTHCOM may need additional FMV capability to monitor a Russian exercise off the coast of Alaska. There is no additional force provider capacity to allocate to meet the emergent requirement. Notional reallocation options to consider include moving counter drug assets out of USSOUTHCOM or moving assets out of USCENTCOM who are supporting combat operations. In this notional scenario, the risk to USSOUTHCOM mission priority is less than the risk to combat operations in USCENTCOM. The risk to mission is the most significant factor to the model.

A third option would include contracting FMV capacity from a commercial vendor. This option has a dollar cost associated to it. Using a model that can objectively optimize recommendations while taking into account risk, may show that the dollar cost is significantly less than the cost to force readiness or the cost to the risk to mission. Not only will the model provide context for decision, it will provide transparency to the CCDRs, force providers, the Joint Staff, and the Department of Defense.

Combing the optimization model described throughout this thesis with a risk informed model that can be implemented for the force allocation of all ISR capabilities is a logical evolution that optimizes the force allocation decision process that informs the SECDEF for force decisions and responsibility.

About the Author

Lieutenant Colonel Seward E. Matwick graduated from the United States Air Force Academy with a Bachelors of Science in Mathematics in 2001. After receiving his commission, he attended the Massachusetts Institute of Technology and graduated with a Masters of Science in Materials Science and Engineering in 2002. He attended Euro NATO Joint Jet Pilot Training (ENJJPT) at Sheppard AFB, TX. His first operational assignment was in the F-16 at Misawa AB, Japan from 2005 to 2008 where he participated in Operation Iraqi Freedom. Next, he served as an exchange officer to the Royal Air Force at RAF Valley, United Kingdom where he flew Hawk T-1s. After serving as an instructor pilot for the RAF, he transitioned to flying the MQ-1 and MQ-9 at Creech AFB, NV. During that tour, he served as a deployed detachment commander in support of Operation Juniper Shield and as the 22d Reconnaissance Squadron's Director of Operations. He then served one year on the combined, joint staff as the Key Resolve Exercise Branch Chief in the CJ37 at Yongsan AB, Republic of Korea before being selected to attend the Air Force's School of Advanced Air and Space Studies. Following his assignment at Maxwell AFB, Lt Col Matwick was assigned to the 432 AEW, Creech AFB.

Acknowledgements

I would like to thank my advisor, Dr. Thomas Hughes, for his guidance and patience as I repeatedly stumbled through this endeavor. I am indebted to him for the freedom he allowed me to pursue this meandering study and for the effort he spent pushing me to better articulate my argument. His kindness will not be forgotten.

I would also like to thank my reader, Col Tim Cullen, who generously shared his expertise in the field of unmanned systems and included me in several RPA-related gatherings.

Several subject matter experts volunteered their time and served as a sounding board throughout the creation of this project. Fellow RPA pilots, Maj Alex and Maj Bishane, helped me with the initial topic idea and provided blunt feedback, often for just the price of a beer. Lt Col Jason Green at the 558 FTS opened his squadron to me, provided countless documents, and introduced me to numerous knowledgeable sources. One of those was Lt Col Jeff Wiseman, USAF (ret.), who allowed me to repeatedly interview him across numerous phone and office calls. Additionally, the Army UAS enterprise, whether at the 2-13th Aviation Regiment or at Training and Doctrine Command, provided liberal access to their personnel, students, and course material. For everyone who was so generous with his or her time and support, thank you.

Most importantly, I would like to express my deepest gratitude to my family. A great deal of effort went into this project, much at the sacrifice of my wife and children. My wife's patience, understanding, and sacrifice permitted me to focus on the academic material and writing, neither of which came particularly quickly to me. I think she will be more relieved and grateful at my SAASS graduation than I will. Thank you for your support and love.

Abstract

Demand for UAS is here to stay, and the U.S. Air Force force structure needs to adjust away from a contingency mindset to an enduring capability. AF leaders have turned their attention to this challenge, but difficulty normalizing training in such a dynamic field is elusive. The current AF training model has struggled to meet rising demand. What the AF needs is a new training strategy. This thesis examines AF and Army UAS training, why they are different, and what strategy the AF should adopt. Behind such simple questions lie different organizational structures and visions. Despite common technologies, each service approached UAS from different starting points, and created different training models. The AF built its RPA training based on its other aviation training programs, and hindered the organization's ability to deal with automation, significant personnel changes, and airspace integration. Conversely, the Army's UAS training community started with small, remote-controlled drones over 25 years ago at Fort Huachuca, Arizona. It has grown and expanded into new platforms with new capabilities, and its model of universal enlisted operators trained to operate as an organic divisional asset remains. The AF and Army's training programs each create a different product and, in turn, reflect institutional disagreement over what skills should be imparted. The Air Force's conflict between utility and tradition in its UAS training will have a profound effect on the AF, whose ultimate raison d'etre is to fly, fight, and win—in air, space and cyberspace. In the end, this study argues for a training strategy that leverages the RPA weapon system's unique modularity to produce well-trained RPA pilots more quickly.

Introduction

The Air Force still has an enterprise that is undermanned, overworked, and demoralized while facing a potential mass exodus of pilots and insufficient training infrastructure to replace these losses

.

Tom Cotton, U.S. Senator,
Committee on Armed Services Opening Statement,
"Army Unmanned Aircraft Vehicle and Air Force
Remotely Piloted Aircraft Enterprises,"
16 March 2016

On March 16, 2016, the Senate's Committee on Armed Services questioned General Herbert J. Carlisle, Commander of the AF's Air Combat Command and General David G. Perkins, Commanding General of the Army's Training and Doctrine Command. The hearing and subsequent testimonies addressed issues raised in a Government Accountability Office report titled "Unmanned Aerial Systems: Further Actions Needed to Fully Address Air Force and Army Pilot Workforce Challenges."[1] In the report, the GAO concluded that the AF had not fully addressed pressing issues of personnel requirements, retention difficulties, and producing enough pilots through its training pipeline. The result, as stated by Senator Tom Cotton of Arkansas in his opening remarks, is that "Despite literally dozens of reviews, task forces, studies, and reports on unmanned aircraft enterprises by the Department and the GAO, much room for improvement remains. It is plain that the Department is still struggling with [this] transformation."[2]

The Department of Defense grapples to manage the unmanned aerial systems' remarkable rise. Though unmanned flight dates back to the infancy of aviation itself, technological capabilities did not meet military and political demand until the 90s when advancements in space communications, computer processing, intelligence gathering, precision weaponeering, robotics, and network centric warfare coalesced into one

culturally-redefining military platform. From the Balkan conflict in 1995 to Operations Iraqi Freedom and Enduring Freedom, demand for unmanned drones had turned into an uncontrolled conflagration. As drone missions increased tenfold, operators were pushed relentlessly to meet the insatiable demand. Rapid growth resulted in a series of haphazard improvisations in operations, personnel management, and training. Anticipated drawdowns in Iraq and Afghanistan, however, have not provided an expected respite, and pressing demand has risen in Libya, Syria, Niger, and Somalia. Demand for UAS is here to stay, and the force structure needs to adjust away from a contingency mindset to an enduring capability. AF leaders have finally turned their attention to a long-overdue training bill, but normalizing training in such a dynamic field is proving elusive. What the AF needs is an entirely new training strategy.

As the two generals testified, sitting beside each other, they described vastly different problems. The disparate issues reflected different approaches each service took to Unmanned Aerial Systems (UAS) operational employment, personnel management, and training. Strikingly, despite operating remarkably similar platforms produced by the same manufacturer, General Carlisle stated, "The MQ-1C, the Gray Eagle, and the MQ-9 Reaper are totally different systems. The tactics, techniques, and procedures doctrine would be similar, but the actual training on the system between the MQ-9 and the MQ-1C are significantly different."[3] To outside audiences, these differences are not intuitive. While the Army and Air Force may have justified integrating unmanned aircraft in their services based on unique competencies, roles, and mission requirements, the security environment has forced increased overlap. In actuality, Army and AF employ similar aircraft utilizing similar capabilities, operating in the same airspace, and supporting the same customers. This leads one to conclude that service culture is the primary differentiator for any remaining program differences.

A historian of technology, Thomas P. Hughes, provides the academic framework for such thinking in his theory on technological momentum. He states, "The social constructivists have a key to understanding the behavior of young systems; technical

787 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

determinists come into their own with the mature ones."[4] In layman's terms, sociologists advocating technological momentum posit that innovations are initially strongly susceptible to cultural shaping. Hughes argues that time drives what influences advancement. Early in a systems development, sociocultural pressures shape how a system integrates, and, in older systems, technology determines change. In the case of UAS, its formative stage gave both services the leeway to incorporate a new weapons system into its respective cultures. Despite common technologies, each service approached UAS from different starting points to create a different training pipeline.

The rise of UAS presents a unique opportunity to compare and contrast two training pipelines and determine how each services' organizational values manifested. Each training program creates a different product and reflects institutional disagreement over what skills should be imparted despite remarkably similar end-state capabilities. If Hughes' theory is correct, UAS maturation will drive the AF and Army training programs closer together, and, in the process, test the services' underlying cultural assumptions. Current efforts, however, drive the community closer to the AF's manned flying communities rather than Army's UAS. Whether such a strategy is wise or even possible, or whether the AF can realize RPA's utility within its cultural confines, is the focus for this thesis.

This study hopes to fill a literature void that has heretofore left the divide between Army UAS and AF RPA operations and training relatively unexamined. Previous studies briefly described the different services' approaches to UAS operator training, but not explored the cultural reasons why they are different. This thesis examines AF and Army UAS training, why they are different, and what strategy the AF should adopt going forward. Behind such simple questions lie organizational structures and differing visions that make untangling the issue difficult. Underlying assumptions, particularly for the AF, start to unwind when increasing automation, significant personnel changes, and airspace integration push RPA's future away from AF tradition. This conflict between utility and

788 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

tradition will have a profound effect on the AF, whose ultimate raison d'etre is to fly, fight, and win—in air, space and cyberspace.

Overview

This study focuses on the Army and AF's medium altitude, long endurance (MALE) UAS operator training pipelines, starting from the initial course and onto qualification for the MQ-1C Gray Eagle and MQ-9 Reaper, in an effort to compare training for similar platforms. The AF is currently phasing out its MQ-1B Predator, a more similar platform to the Gray Eagle. Reaper and Predator training are nearly identical, and, therefore, examining Reaper training is a reasonable substitute. When addressing both services, terminology will be industry standard: UAS and operator for example. Service specific verbiage like RPA and pilot are used when treating each service individually.

This thesis uses Edgar Schein's framework on organizational culture to understand the dynamics of change and the AF, its RPA community, and the Army. Schein defines culture as a series of assumptions a person makes about the group in which they participate. He divides assumptions into three levels. Each level becomes more difficult to articulate and change, and more influential on the other levels.[5] First are assumptions about external adaptation issues. Culture develops as groups express assumptions when making decisions on missions and strategy, goals, means, measurements, and corrections in response to external stimuli. On the second level are assumptions about managing internal integration. As groups decide how to work together, they create culture by the choices they make on internal integration issues like power distribution, friendship norms, defining rewards and punishments, and defining group boundaries. The third level comprises deeper cultural assumptions that reflect the group's view on fundamental issues like time, space, human nature, and the nature of human relationships. These deeper dimensions answer questions like how humans should interact and where leaders derive their power.

[5] Schein, 26.

789 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

An observer can see these assumptions through artifacts, espoused beliefs and values, and underlying assumptions. Artifacts are visible organizational structures and processes that may be hard to decipher to outsiders. Examples include military insignia, corner offices, and designated parking spots. Espoused beliefs justify actions through codified strategies, goals, and philosophies. The AF's core values of integrity first, service before self, and excellence in all we do are examples of beliefs embodied in an ideology that "can serve as a guide and as a way of dealing with the uncertainty of intrinsically uncontrollable or difficult events."[6] When those values repeatedly produce success, groups transform them slowly into basic, nonconfrontable assumptions that provide stability and meaning. Underlying assumptions are extremely difficult to change.

The first chapter educates the reader on the origin of AF RPA training and describes the current Undergraduate RPA Training (URT) and MQ-9 Initial Qualification Training (IQT) syllabi. The chapter's historical look starts in 1996 and continues to the present to show how the influence of civilian leaders, capabilities requirements, and AF culture mixed to create RPA training. Chapter 2 describes the manning woes the training pipeline struggles to overcome and the current remediation plan in effect. Chapter 3 transitions to the Army's UAS community and explores how its training system reflects its unique beginning. Much more organically developed and resourced by the Military Intelligence Branch, Army UAS thrived under its sometimes watchful, sometimes neglectful eye.

Chapter 4 looks to the future to identify and explore approaching advancements that will either threaten or provide opportunities to the AF's training system and its normalization efforts. The chapter addresses three specific developments: increasing automation, the AF introduction of enlisted RPA pilots, and the Federal Aviation Administration's push to integrate UAS into the national airspace. It peels back how AF service culture and emerging change may shape RPA training. More automation, low expected retention, and the introduction of the enlisted pilot threaten not only the AF training culture but also its identity.

[6] Schein, 29.

790 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

Chapter 5 establishes a comparison methodology and begins directly comparing both services' training pipelines. This chapter merges the insight gained into AF culture with emerging threats and opportunities to analyze possible RPA training strategies going forward. The first section presents a method to analyze, classify, and test current and potential strategies. The second section dissects the AF's current RPA training strategy of focused differentiation in the context of its broader Strategic Master Plan and in comparison to Army UAS training.

Finally, Chapter 6 takes the final step and answers what training strategy the AF should adopt as RPAs enter mainstream aviation. At that point, the AF will broaden its training strategy into either Low Cost Leadership or Differentiation. This chapter conducts a Strength, Weakness, Opportunity, and Threat (SWOT) analysis of each strategy and recommends a Low Cost Leadership course of action. To conclude, a five-question check scrutinizes this strategy recommendation to see whether the chosen strategy has a distinctive value proposition, a tailored value chain, trade-offs that are different from rivals, a good fit across the existing value chain, and whether there is continuity over time.

The AF and the Army offer competing views on the future of UAS training. Both services export its cultural values, as the Navy, USMC, and international partners watch and adopt best practices. Finding the right technical approach may require overcoming cultural barriers, but just as likely, an effective training strategy may be able to accommodate various cultures. Such a crisis presents an opportunity to course correct; now is the time to properly tailor RPA training to leverage today's capabilities while anticipating tomorrow's technology.

791 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

Chapter 1
AF RPA Training History

Ultimately, all organizations are sociotechnical systems in which the manner of external adaptation and the solution of internal integration problems are interdependent and intertwined. Culture is … not easily reduced to a few major dimensions. Culture reflects the group's effort to cope and learn; it is the residue of that learning process.

Edgar Schein, Organizational Culture and Leadership

Edgar Schein creates logical stepping stones to explain how an organization's culture develops and influences decision making. Examining an organization's cultural origin and subsequent issues faced is an important step to understand how it makes decisions. This chapter will explain and then use Schein's framework to examine the origins of the AF's Undergraduate RPA Training and its status. The chapter will conclude by identifying the underlying assumptions, values, and artifacts reflected as the AF developed Undergraduate RPA Training (URT).

U.S. military operations in Afghanistan and Iraq required real-time information. As combatant commanders struggled to understand the battlefield, they relied increasingly on RPA's Intelligence, Surveillance, and Reconnaissance (ISR) coverage of full motion video. This demand relentlessly pressured the RPA community to increase its hours flown. Consequently, combat lines, then known as combat air patrols (CAPs), grew exponentially and outpaced the AF's will and ability to keep pace. Under these difficult conditions, the RPA community solved problems of member identity, goal setting, metrics selection, labor division, and correction. In the process, it created a culture around learned solutions to these problems. URT is more than a training course; it is the cultural manifestation of "the ultimate problems that every group faces: dealing with its external environment and managing its internal integration."[1]

[1] Schein, 85.

792 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

Context Surrounding URT Standup

Schein states, "If the environmental context is changing, such conflict can be a potential source of adaptation and new learning."[2] This certainly describes the Air Force's predicament in 2007 as it struggled to understand the context in Iraq and take appropriate action to quell the rising counterinsurgency. Shein's cultural framework includes five steps of adaptation that organizations continuously cycle through in response to external change: mission and strategy, goals, means, measurements, and correction. On January 10, 2007, President Bush addressed the nation and covered each step. He frankly admitted, "It is clear that we need to change our strategy in Iraq."[3] Current actions based on faulty assumptions were not meeting goals nor achieving peace, and the stakes of defeat meant losing the "decisive ideological struggle of our time."[4] He then articulated a new strategy and new metrics:

> The most urgent priority for success in Iraq is security, especially in Baghdad. Our troops will have a well-defined mission: to help Iraqis clear and secure neighborhoods, to help them protect the local population, and to help ensure that the Iraqi forces left behind are capable of providing the security that Baghdad needs.[5]

The President explicitly declared new assumptions: protecting the local population and strengthening Iraqi forces would achieve victory. This change required a different force structure, and he authorized twenty thousand additional soldiers to Iraq and increased deployment durations. Instead of kinetic strikes and force to win, the troop surge marked a mission refocus to security. President Bush closed his speech by defining what success looked like. "Victory in Iraq will bring something new in the Arab world -- a functioning democracy that polices its territory, upholds the rule of law, respects fundamental human liberties, and answers to its people."[6]

President Bush's new approach set in motion a collision course between Secretary Robert Gates' mandates and the AF's reluctance to address ISR supply shortcomings. The AF struggled to accept its tactical, supporting role and adapt its skill set, weapons

systems, and training output in reaction to the new character of warfare. In 2014, Gates described in his memoir how the AF resisted change. He commented, "Whatever the complications, the surge of troops in Iraq and mounting difficulties in Afghanistan required a surge in ISR capabilities. Indeed, in nearly every one of my weekly videoconferences with Dave Petraeus, first in Iraq and later in Afghanistan, he would raise the need for more ISR."[7] The AF did not agree with this assessment, and it made no plans to increase beyond the eight MQ-1 Predator combat lines it was providing. Each combat line provided over 20 hours of surveillance daily. Gates pushed for change but did not get a satisfactory response. His frustration mounted, as he surmised, "As the need for more ISR kept growing through the winter of 2007-8, it was clear my haranguing wasn't working."[8] Clearly, the external environment and its requirements were at odds with AF values. Airmen's culture needed transformation, but deeply held values do not change easily.

The AF's historical internal integration explain why the AF did not willingly pursue change. Previous decisions reveal institutional preferences for pilots and manned aircraft. Fighter pilots' monopoly on key leadership positions makes clear assumptions about power, status, rewards, and punishments. Asymmetric warfare created a need suited to unmanned aircraft and its long endurance capability, a need that traditional aircraft could not fulfill. Even when the skills and services provided by fighter pilots were found wanting, the AF refused to reexamine its underlying assumptions until Secretary Gates pushed it.

Unfortunately, Secretary Gates perceived that the AF leadership was shirking and out of touch.[9] Several developments confirmed his suspicions that AF leadership did not accept the urgency for more ISR and were not taking creative steps to acquire more. One was the AF's tone-deaf proposal to discontinue the U-2, a key strategic ISR asset. Another signal to Gates was the AF's preoccupation with unrelated acquisitions projects. Those projects, specifically the F-22 and a new bomber, reinforced AF cultural

[9] In Peter Feaver's *Armed Servants: Agency, Oversight, and Civil-Military Relations*, he introduces a working-shirking continuum to describe the military's varied levels of compliance to its civilian leaders. He defines shirking as doing things the way those in the military want.

794 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

assumptions about pilot primacy and its glorious struggle for conventionally attained air supremacy, but were at odds with Gates' desires and Petraeus' needs. Gates states,

> Then, at a time when we were trying to put every intelligence platform possible into the war, the Air Force proposed ending all funding for the venerable U-2 spy plane by the end of summer 2008. I thought proposing to ground it at this juncture was just plain crazy. Further, nearly every time Moseley and Air Force Secretary Mike Wynne came to see me, it was about a new bomber or more F-22s. Both were important capabilities for the future, but neither would play any part in the wars we were already in.[10]

Previous interactions with the AF as CIA director earlier in the 90s had primed Gates for this resistance. Then, he had tried to persuade the AF to develop drones to pursue its potential advantages of loiter, collection, and signals intelligence. He was rebuffed and told that people join the Air Force to fly airplanes, and drones had no pilot. When he returned to government in 2006, he was disappointed to see that "the Air Force mind-set had not changed."[11]

AF intransigence and Secretary Gates' determination would cost the AF in two long-lasting ways. First was the AF's miscalculated bid for executive agency over the RPA. On one hand, the AF had little enthusiasm for building its RPA fleet and providing the combatant commander and, by extension, the Army, with sufficient ISR. On the other, it was grasping for absolute control of this asset. Gates was loath to give oversight of RPAs to the AF.[12] Second, Gates dismissed the Secretary of Air Force Mike Wynne and General T. Michael Moseley, the CSAF. General Norton Schwartz, a C-130 pilot, replaced General Moseley. By selecting Schwartz, the only recent Chief of Staff not from the fighter or bomber community, Gates signaled the AF's need to fence mend with the Army and remedy its previous "stinginess in getting to ground commanders badly-needed UAV assets."[13] While Moseley had put on hold and then cancelled URT, his replacement, Schwartz gave the green light during a speech just a few months after taking over.[14]

795 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

Schwartz's command to grow the RPA fleet forced the AF to scrutinize its assumptions about internal integration. Group boundaries excluding unmanned aviation needed reexamination. Power and status from other communities toward RPAs would not be ceded willingly, but the RPA's sheer size, growth, demand, and capabilities could no longer be dismissed. Lack of rewards like professional military education (PME), promotions, or staff positions initially plagued the community, and significant effort continues to this day to reverse this perceived punishment.

AF Thoughts on URT

The AF then rapidly established initial classes as a Beta Test and then established a formalized Undergraduate RPA Training course. Despite its hurried response, much previous internal AF thought and debate over the years had gone into who should fly RPAs. While external conditions forced the AF to expand its RPA program, the AF had the latitude to use its cultural preferences to institute a solution. Organizations reflect internal assumptions in their decision-making, and the standup of URT stands as a strong embodiment of the AF's culture. "Beyond Butterflies," a 2007 SAASS thesis by then-Major Houston Cantwell, lends insight into the logic influential AF leaders used to craft URT. Cantwell's many interviews trace strategic leaders' thoughts and decisions over the years as they struggled to overlay AF culture onto a disrupting innovation.[15] These thoughts leading up to 2007 foreshadowed the establishment of a dedicated 18xx Air Force Specialty Code (AFSC) and training pipeline.

AF personnel policies on UAV aircrew are rooted with General Ronald Fogleman, former CSAF. In 1995, the AF had little interest or involvement in the Predator's Advanced Concept Technology Demonstrations (ACTD) process under DARPA. But then, three developments--operations in Bosnia that demonstrated UAV capability, interservice competition with the Army, and leadership interest--coalesced into a sudden service bid for Predator.[16] Fogleman anticipated that Predator was going to be fielded, and he felt the AF was best positioned to exploit the platform. Prior to AF

796 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

interest, the Army had operated the Predator unit and was naturally suited to assume the position as lead service. Fogleman was disdainful of the Army's approach to UAVs and was convinced their poor service and safety record would implode the program. In response, he established a new UAV squadron, the first UAV squadron since 1979. Fogleman's position and eclectic background gave him the authority and perspective to identify this transition point and mobilize AF resources to get Predator.[17] His varied career path included a distinguished Forward Air Controller (FAC) tour in Vietnam as an F-100 pilot and a tour teaching history at the Air Force Academy. In the 1980s, Fogleman, as an Air Division commander, stood up ground-launched cruise missiles, something that had contrasted sharply with the AF's cultural affinity for flying airplanes. Prior to his CSAF appointment, he commanded Air Mobility Command and Transportation Command. These varied experiences broadened his aperture, and his weight of influence proved pivotal in wresting control of the Predator program from the Army.

Fogleman's time as CSAF marked the genesis of Predator, and he formulated the original policies that still affect the community's culture. In his bid for program control, Fogleman argued the Army's poor UAS record was in part due to its approach. Amongst fellow AF generals, he imbued the view that they were going to "treat it like an airplane."[18] He also provided the necessary personnel to assure Predator's early success. Besides standing up a dedicated UAV squadron, he assigned non-volunteer instructor pilots to fly the Predator UAV. "If this program fails," he commented at the time, "it won't be because of our pilots."[19]

This first requirement introduced initial values to Predator's emerging subculture. First, by requiring pilots, Fogleman defined the RPA's boundaries. Being a pilot was the critical criteria for inclusion. He had successfully excluded the Army and its enlisted operators, and navigators could volunteer only if they had personally procured their pilot licenses. Pilots surveyed overwhelmingly assessed that training requirements prior to

[17] Ehrhard, 51.

797 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

Predator initial qualification training were roughly equivalent to undergraduate pilot training. Further, they believed that "manned aircraft flying experience [was] essential to effective employment of the Predator."[20] This survey had an air of authority despite lacking a formal requirements review. Essentially, junior pilots had supported the AF's defined boundaries.

Fogleman created a perception by assigning non-volunteers to a Predator tour. Pilots identified the tour as a punishment, a notion that would haunt the community. Communities subsequently relegated poor performers to RPA assignments, and the Predator developed the leper colony's curse of low status and power. Had manning requirements framed the assignment as a select opportunity available only to volunteers, whether pilots or officers with flying experience, the community's misfit label might have been avoided.

Staffing policy also fragmented the RPA subculture. The assignments drew from multiple communities each with their own subculture. After a three-year tour, pilots would return to their previous communities. To add to the fragmentation, separated ground control stations, constant shift work, and the lack of coordinated, socialized flying missions isolated squadron members. Loose personal bonds resulted, and camaraderie suffered. This weakened the potential institutional power of the RPA community and reduced its clout among other subcultures. When Fogleman abruptly resigned, no powerful advocate replaced him until General John Jumper four years later.

General Jumper picked up where Fogleman left off. He advocated arming the Predator with Hellfires and adding a laser designator while commander of ACC. As CSAF, he published an RPA strategic vision. He echoed Fogleman's approach of using pilots, stating,

> The original notion of using pilots was because of the Army experience [with UAVs]…If you treat it like an airplane it will act like an airplane…. We were trying to get the accident rate down and get the operator caused accidents down. We knew if we crashed a bunch of these things that we weren't going to get [the program] either. That's why we insisted on pilots.[21]

[21] Quoted in Cantwell, "Beyond Butterflies," 79.

798 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

As the AF gained RPA experience, Jumper softened on this issue and started advocating for a Combat Systems Officer concept. In February 2003, he directed a reengineering of undergraduate navigation training to incorporate a remotely piloted aircraft track in the new revised program. The Combat Systems Officer concept built upon traditional Undergraduate Navigator Training (UNT) to create "credentialed warriors." His 2005 RPA Strategic Vision conveyed this approach: "the Air Force vision is to develop a new career field to man these billets. Part of this transformation will be the creation of an RPA training program for new Air Force officers and enlisted personnel to transition directly into RPA."[22] The pipeline to create dedicated RPA pilots "hopelessly tied to future acquisition, employment doctrine, and career path development" would spur community investment and innovation.[23] Jumper's leadership laid the groundwork to change the community's initial assumptions about who would fly RPAs.

The step from vision to fruition took place in 2008. Internal disagreement existed about the desired training requirements for RPA personnel, but a near unanimous consensus within AF leaders emerged that an officer with developed airmanship was required. Some felt a rated airman was a prerequisite to flying safely in an integrated national airspace, some felt that high airmanship levels were required to solve dynamic problems, and some were concerned that a distinct career field would create second class citizens.[24] Ultimately, a new career field was created with a dedicated training pipeline. This satisfied two goals: the desire to impart needed technical skills and the cultural buy-in required for long-term success of RPAs. Those who recognized the future of RPA also recognized the large stake the AF had in the program. Then Brigadier General Charles Lyon, former 57th Operations Group Commander noted, "if anyone can fly a Predator then anyone can fly UAVs—any rank, any service. If anyone in any service can fly a UAV then the USAF cedes our authority over managing, commanding, and controlling the effects that take place from the air to anybody that wants to do it."[25] By creating a

separate AFSC, the AF had attempted to settle internal issues and better allow its people to concentrate on performing its mission. Schein's organization culture theory describes the path the AF followed to maintain operational relevance in the face of a disruptive technology: "the confrontation of survival issues most often is the critical stimulus that creates rapid consensus around the internal integration issues. The internal integration and external adaptation issues are thus interdependent."[26]

Building URT

Training is vital to military organization. Three elements are vital to the training process: tasks, conditions, and standards. Tasks are the tangible questions to be dealt with, conditions are the operating environment where the function is to be performed, and standards are the minimum of acceptable proficiency.[27] Training is task dependent and focused on a specific skill and the tools of that specialty in a stable environment with known conditions. In times of rapid changes to tasks, tools, or conditions, training by its very nature will struggle to maintain relevancy. The struggle to keep RPA training relevant when mission requirements and capabilities continue to evolve is substantial.

General Jumper retired from the AF on November 1, 2005, but not before setting the wheels in motion for a dedicated RPA pilot AFSC and training pipeline. The next stage involved translating the vision into a training course. That would fall to a recently retired F-15E Weapons Systems Officer named Lt Col Jeff Wiseman in Air Education and Training Command's A3FR branch. As the development progressed, he hired another recent retiree, Lt Col Robert Englehart. These two would build URT.

Undergraduate RPA Training was a piecemeal creation. It initially borrowed heavily from the Combat Systems Officer (CSO) training syllabus and some from Specialized Undergraduate Pilot Training (SUPT) to maintain a commonality across AETC's Undergraduate Flying Training.[28] Colonel Stephen Wilson, the AETC Assistant Operations Officer in 2006, recommended following SUPT's developmental

methodology. Wiseman and Englehart heeded that advice. First, they identified the necessary skill sets required to operate UAVs by soliciting input via survey from the formal training unit at Creech AFB. The two contacted the FAA for input to ensure URT graduates would be qualified to transit in national airspace, a key requirement. Goals established at this phase included: to provide qualified graduates to enter RPA Formal Training Units, to impart foundational skills to meet RPA mission requirements, to impart the ability to operate in National Airspace System or International Civil Aviation Organization airspace, to grow and sustain professional RPA community, to train pilots—not operators, and to instill airmanship and flight discipline.[29] Second, Wiseman and Englehart borrowed tactical instruction from the CSO syllabus. Similar to CSO training, classroom academics would be in lockstep with computer-based training and simulation. Front loading contextual operational academics on tactics, authorities, and command structures was intended to ease the transition a recent graduate would make into the operational environment.

Third, a mandate existed from the start to maintain efficiencies, keep costs under control, and proceed quickly. Feedback from the Predator Formal Training Unit identified flight experience as crucial to follow-on training, and flight screening was placed as URT's first phase. In accordance with maintaining efficiencies, the then-AETC commander, General Stephen Lorenz, insisted on integrating this screening into other training pipelines in Pueblo, Colorado. Initially, 18 hours were allotted, same as SUPT candidates, to allow for local area flying and a solo flight. Later, the FTU and operational units requested more student instruction to increase airspace awareness. Subsequently, Initial Flight Screening expanded to 39 hours, adding more local flying as well as cross-country orientation.

In parallel to this developmental effort, officials conducted trials placing non-rated officers directly into the MQ-1 Formal Training Unit at Creech AFB. Lt Leslie's experience as the first test case demonstrates the difficulty the AF had adapting its bureaucracy to the RPA enterprise.[30] In 2005, Lt Leslie had been eliminated from SUPT, unable to overcome motion sickness. Before his dismissal, he had completed

[29] HQ AETC/A3F.
[30] Major Leslie, USAF, (49 Wg OGV), interview by the author, 7 Jan 2017.

801 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

introductory academics, solo'ed, and progressed to his pre-contact check ride in the T-6. Thirty days out from administrative separation, Maj General Mark Zamzow, a family friend, contacted Leslie to see if he was interested in participating as the inaugural test member. A few months later, Leslie joined MQ-1 Class 06-03 along with members of the California Air National Guard. The FTU instructors enrolled him into the class without any special treatment or additional preparation. He successfully navigated the course, including a form 8 check ride. Along the way, his progress informed and refined AETC's developing syllabus. Upon graduation, Leslie received an e-mail from the Operations Group commander. In his e-mail, the OG relayed authorization for Leslie to wear aircrew officer wings. Without ceremony, he summarily went to the uniform store and purchased his wings.

Lt Leslie reported to the 15th RS and immediately met roadblocks. A running tally of issues mounted that following classes would later solve. Questions surrounded whether he was rated or not. Was he entitled to flight pay, to sign a flight authorization, or required to fulfill flying gate months? The Squadron Aviation Resource Management personnel could not enter him into their database tracker with his unique 17xx AFSC designation. How then would the SARM office record his flight hours? No authority pushed through any resolutions, and the squadron did not authorize Leslie to fly. Instead, he made himself useful in the squadron as a Mission Intelligence Coordinator (MIC) and then as the Senior MIC. Without a senior AF advocate pushing to overcome cultural hurdles, a distinctive Predator training pipeline was paused. In October 2006, without explanation, the AF notified Leslie that it had cancelled the trial. Lt Leslie transferred to the missile career field and bided his time.

In September 2008, General Schwartz directed the standup of URT, and in January 2009, the first RPA Beta test class started. Forty qualified volunteers across the AF applied, and ten joined the initial class. The Beta test trialed the syllabus, taking previous aircrew and non-aircrew alike through flight screening, then instrument training, and finally an RPA fundamentals course. The classes then reported to the Predator FTU and folded into established transition courses. Lt Leslie rejoined the RPA community and graduated from the fifth and final Beta test class. In May 2010, General Schwartz declared the trial a success, and five months later, the first URT class started. All

802 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

accession sources contributed to the RPA pilot candidate pool, and the Air Force Personnel Center designated RPA pilots as the 18xx AFSC. In two short years, RPA training had morphed from the initial "go-do" order to concept to testing to production. Additionally, URT operated at a fraction of the cost of SUPT. AETC approximates URT costs at $65k per graduate while SUPT averages $560k per graduate.

Many RPA pilot milestones have followed. To date, 917 RPA pilots have graduated. Their many accomplishments include operating "solo" in combat since 2009, countless weapons deliveries, thousands of flight hours, instructor qualifications, serving on MAJCOM Staffs, graduating from the Weapons Instructor Course, and serving as squadron directors of operations. Initially, the community was skeptical of young RPA pilots arriving at Creech AFB. As their performance validated the training pipeline, direct MQ-9 billets became available. Starting in 2012, the MQ-9 FTU accepted RPA pilots for initial qualification training. The mixed community is making strides to transition toward 90% 18xx personnel.[31] The next imminent milestone is the community's first 18xx-designated squadron commander. URT grows more effective at graduating students as instructors gain experience and students manage course expectations better. Overall attrition numbers decrease each year. In 2011, attrition stood at 36%, and it declined to 10% by 2016. This final metric testifies to the program's success in filling ISR demand: RPA pilots will be the largest group of AF pilots by 2018, after only six years of existence.[32]

URT Description

URT, as it stands now, consists of three courses: RPA Initial Flight Training, RPA Instrument Qualification Course, and RPA Fundamentals Course.

RPA Initial Flight Training (RFT) shares a flight screening contract operation in Pueblo, Colorado with SUPT and UNT. Initially modelled as a screener, URT granted candidates 18 hours of flight instruction and was the greatest cause of attrition. This feedback combined with a reevaluation led to an increase in flight hours with potential for re-flying rides. Correspondingly, AETC/A3FR updated the course title from RPA

803 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

Introductory Flight Screening to RPA Introductory Flight Training. The training takes 8 weeks and consists of 35 training days. Students fly 39 hours in Diamond DA-20. Twenty-two flights are dual sorties, and five are solo. Academics include basic flight maneuvers, flight safety, emergency procedures, navigation, and communication. Students must pass the FAA's Private Pilot Knowledge Test. This stage is a contracted operation and costs $10k per student. Ninety-nine percent of attrition occurs in this phase.

The 558 Flying Training Squadron at Randolph AFB, Texas instructs the RPA Instrument Qualification (RIQ) course following flight training. Original concepts of URT considered an RPA track after T-6s in SUPT, but RFT along with a T-6 simulator-based instrument qualification course replaced the requirement. Over 56 training days, instructors deliver 140 hours of classroom academics and instruct 36 simulator sorties totaling 47 hours in a T-6-like Flight Training Device simulator. In later stages of the course, instructors link the simulators, and students interact in an air traffic pattern with each other and an Air Boss who controls the ensuing chaos. This forces students to act under stressful, unpredictable situations. Additionally, students receive emergency procedures training and practice applying corrective actions.

The last phase of URT is the RPA Fundamentals Course (RFC). Described as "a mile wide and an inch deep," it is designed to introduce students to operating an RPA in a tactical environment as well as educate them on tactical mission elements ranging from the unique physiology requirements of 24/7 shift work to traditional Close Air Support procedures. The course is 22 training days, and the syllabus allots 78 academic hours and 31 simulator hours. The simulators, called Predator Reaper Integrated Mission Environment (PRIME), replicate the console interfaces and displays students will see at the MQ-9 FTU. Course material includes physiology, joint force command & control, datalinks, bandwidth, GPS, threats, brevity, weapons, air defense, and mission systems. Upon URT completion, the 558 FTS hosts a winging ceremony and pins specially designed RPA wings on the new graduates.

Reaper FTU

The Predator and Reaper Formal Training Units have had much less internal controversy surrounding its operations or personnel. Its main struggle is graduating enough students in a timely manner to alleviate the community's manning woes. The AF is phasing out the Predator, and what follows here covers the General Atomics MQ-9 Reaper.

Beginning in October 2008, the 11 Reconnaissance Squadron conducted formal training at Creech AFB, Nevada under the 432d Air Expeditionary Wing. The first MQ-9 class started in February 2009, and in October 2009, formal training moved to Holloman AFB under Air Combat Command's 49th Wing. The AF reactivated three squadrons, the 6th Reconnaissance Squadron, 16th Training Reconnaissance Squadron, and the 29th Attack Squadron. To handle increasing demand, the AF reinstituted the 9th Attack Squadron in September 2012, and currently in 2017, the 6th RS is transitioning from the Predator to the Reaper.

The FTU Initial Qualification Training syllabus consists of 157 academic course hours, 22 simulators totaling 58 hours, and 22 sorties totaling 44 hours.[33] The seven academic phases are introduction, transition, ISR/Synthetic Aperture Radar employment, Basic Surface Attack (BSA)/Surface Attack Tactics (SAT), Air Interdiction (AI)/Strike Coordination and Reconnaissance (SCAR), and Close Air Support (CAS)/Combat Search and Rescue (CSAR). Handover training occurs in the transition phase to prepare students for remote-split operations (RSO) at their operational squadron.[34] An emergency procedure evaluation and an in-flight check ride awarding the student an AF Form 8 conclude the course.

[33] MQ 06 (IQT Change 2), 10.

[34] Handover training/remote split operations: transferring aircraft control from a local line-of-sight data link to a over-the-horizon satellite link controlled remotely. Both changing aircraft control and controlling an RPA remotely are two critical enabling capabilities of the RPA infrastructure.

805 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

Recap

The RPA community has significant training hurdles in its future, but its recent success is astounding. In two decades, it transformed from a shoestring operation into the AF's most significant capabilities advancement in decades, possibly eclipsing the development of stealth and precision munitions. Basic technology and combatant commanders' insatiable demand for information created the exponential growth that led to today's RPA community. These challenges forced the RPA community to solve problems of identity, goals, and influence. In "dealing with its external environment and managing its internal integration," the RPA community created URT. [35] In the process, it took a pivotal step to establish its own culture.

Chapter 2

Storm Brewing: RPA's Current Status

In the ISR portfolio alone, we grew an RPA industry from scratch that has become the oxygen the joint force breathes.

General David Goldfein
in CSAF letter to Airmen

Training is the connective tissue that enables Airmen to operate RPAs in a desired way to achieve a desired effect. Fundamentally, training has these requirements: a desired skill to achieve a desired effect, an instructor that possesses the knowledge and techniques to impart that skill, a student, and a tool to translate that applied skill into a result. The overarching assumption in a training environment is predictability. As Shein argues, when an operating environment changes due to external stimuli, an organization develops strategies and goals to respond based on its beliefs and values. An observer can reverse the process by examining an organization's artifacts, espoused values, and underlying assumptions to intuit its culture. Alternatively, if the observer already understands an organization's behavior patterns, he can predict its future decisions.

Few areas in the RPA community have remained static during times of rapid growth in an evolving security environment, yet the community elusively searches for continuity and a desire to achieve sustainable, steady operations. Figure 2 illustrates the exponential growth in combat lines provided by the AF since 2000, with more planned on the horizon. Drawdowns in Iraq and Afghanistan have not reduced persistent, armed ISR requests, as the Pentagon announced plans to increase daily RPA operations by 50% starting in 2019.[1]

[1] Brian Everstine, "DOD Plans 50 Percent Increase In RPA Caps By 2019", *Air Force Magazine*, 2015, http://airforcemag.com/DRArchive/pages/2015/august%202015/august%2018%202015/dod-plans-50-percent-increase-in-rpa-caps-by-2019-.aspx?signon=false.

807 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

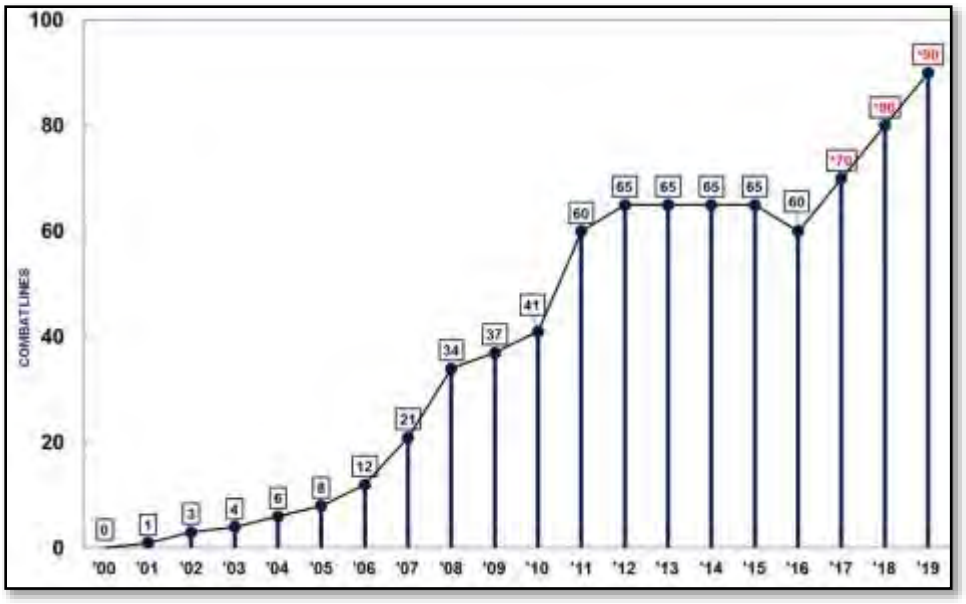

Figure 2: Past, present, and forecasted RPA Combat Lines by Calendar Year
Source: Lt Col Jason Green, "A Brief Look: The State of Remotely Piloted Aircraft (RPA) Operations Local, Global… Past, Present, and Future…"

Despite initial expectations that reduced operations in Iraq and Afghanistan would reduce RPA demand, the opposite has happened. RPA forces have dispersed across the globe, reducing efficiencies gained by concentrating forces. Forecasting on the supply side mirrors the difficulty of predicting demand as well. In 2012, staffs wrongly expected a reduction in force and underestimated future requirements. Planners under resourced the training pipeline, and instructor pilots now struggle to replenish work force requirements. Commanders wait expectantly to see if low retention rates materialize as the first batch of RPA pilots conclude their 6 year Active Duty Service Commitment (ADSC). Staffs struggle to estimate future requirements without historical attrition statistics to rely upon. Low manning sets up a vicious cycle, where stretched working conditions leads to job discontent which leads to increased attrition which then leads back to poor manning. In short, RPA pilots are in short supply, and solutions to escape the downward spiral involve short-term sacrifice, something that makes the problem more acute.

In 2015, Headquarters Air Force responded to community outcries, Congressional inquiries, and external audits. It developed a systemic set of

808 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

initiatives to remedy the community's many issues, and an RPA Tiger Team formed to implement some 57 initiatives addressing manning, pay, scheduling, basing, and squadron organizations.[2] This chapter examines the Air Force's comprehensive and on-going response to its shortfall in three distinct steps. The first step increases training throughput, the second streamlines the training pipeline, and the third reduces attrition to lessen the need for replacement. The initiatives are consistent with larger AF culture, and parsing what those decisions mean at different levels of Schein's cultural assumptions provides greater understanding of how the AF makes choices. The examination of each responsive step will conclude by deconstructing decisions in the context of culture.

First Step: Increase Capacity

The community's on-going manning woes, lifestyle issues, and continuing fight for bureaucratic integration has received attention from Congress, the Governmental Accounting Office, RAND Corporation, and senior leaders. On March 16, 2016, General Herbert Carlisle, commander of Air Combat Command testified before the Senate Armed Services Committee. He addressed the approach needed to alleviate the community's shortfalls:

> The first step to fixing that is to increase the number of RPA crews by increasing the output of our training pipeline. Air Combat Command is responsible for the training of our Air Force's RPA pilots and sensor operators. We will graduate 384 next year which is 200 more than we have graduated annually in past years. This tremendous output is currently achieved with very limited resources as we strive to balance ACC's two main priorities: Provide for Today and Prepare for the Future.[3]

The AF wants 1400 RPA pilots to meet flying demands, staff requirements, and squadron overhead. It currently has 900. URT is doubling its output to close that gap. Accession sources continue to produce an abundant supply of willing URT candidates. According to its Director of Operations, the 558 FTS "is on track to produce 220 pilots [in 2016]. Next fiscal year [2017]-

[2] HAF/A3OC, *RPA Tiger Team Initiatives Update Brief*. 28 Jul 2016.
[3] Statement of General Herbert Carlisle, USAF in "Army Unmanned Aircraft Vehicle and Air Force Remotely Piloted Aircraft Enterprises," unclassified testimony before Senate Armed Services Committee (Washington D.C.: 16 March 2016).

809 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

384 pilots. In perspective, Laughlin AFB, the AF's largest pilot training base, produces 300 pilots annually."[4] The 558 FTS expanded the flight training contract at Pueblo, installed more simulators, stood up more student flights, and added contract instructors to aid in the instrument qualification course and the RPA fundamentals course. The 12th Operations Group is establishing a student support squadron in the summer of 2017 specifically to alleviate increased administrative demands on the 558 FTS.

URT program managers have scaled productions smoothly to meet demand. It contracts out flying operations and relies on simulators and in-class instruction during RIC and RFC. The emphasis on simulator instruction increases scheduling reliability. Weather days exist only at Pueblo for RFT. Production therefore is predictable and timely. Fundamentals taught in RIC do not require RPA experienced contractors or AF instructors. Additionally, URT operates out of Randolph AFB, home of Air Education and Training Command, in San Antonio, Texas. The desirable location provides a large pool of flight instructors to drawn from. Attracting current and qualified RPA pilots from operational assignments has previously been a struggle attributed to URT instructor positions not qualifying for flying gate months. The AETC/A3FR staff corrected the oversight in January 2017, and more pilots are now eligible for an instructor assignment. Should additional RPA pilots be required, a new squadron in a new building will be required as flight rooms, briefing rooms, simulators, and instructors are all fully resourced. In short, the expansion to 384 RPA pilots per year has required great effort from the 558 FTS, but the squadron expects to achieve its production requirements.

[4] Lt Col Jason Green (Director of Operations, 558 FTS), interview by the author, 22 Dec 2016.

810 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

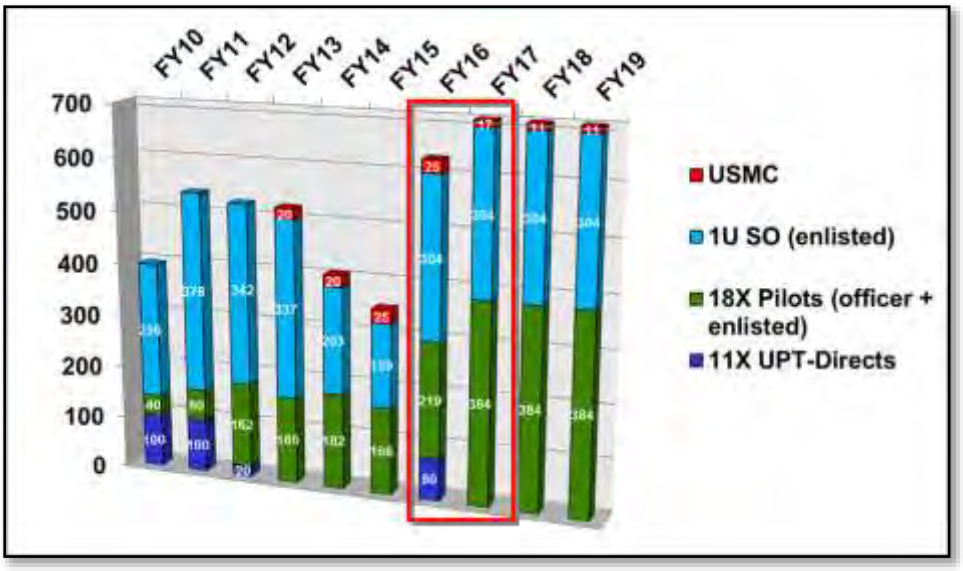

Figure 3: Historical and projected URT output
Source: Lt Col Jason Green, "A Brief Look: The State of Remotely Piloted Aircraft (RPA) Operations Local, Global… Past, Present, and Future…"

While URT has scaled to increase student production and has a viable plan of success, Holloman AFB's Formal Training Unit (FTU) falls further behind its required output. Squadrons are under high pressure to produce qualified graduates in a timely manner, but a multitude of issues conspires against this pursuit. Production requirements have grown, but the pipeline capacity struggles to adjust. The predominant issue is that instructors are under-resourced. Training squadrons use a metric called Basic Course Equivalency (BCE) to quantify the amount of time and resources required across training programs. Planners compute BCE requirements for instructor upgrades, launch and recovery instruction, and initial qualification training, and then ideally devote the timing and personnel resources to achieve the flying program. Problematically, though, no standard model translates BCE into clear staffing and time requirements.[5] No agreement exists on BCE assumptions, meaning that no commander can positively state his unit's production capability. The FTU needs an accepted model to link its capacity to its training burden.

[5] Ferro, Maj Jonathan Ferro and Maj Derek Benkoski. *Issues for the MQ-9 FTU: FY17 & Beyond*. 2016.

811 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

The lack of clarity means that Headquarters Air Force, Air Combat Command, and the FTU Programmed Flying Training manager disagree on how much manpower is required to fix the problem. Headquarters Air Force dictates the Programmed Flying Training (PFT) program, but the RPA community's only PFT manager, the person with the clearest picture, resides at Holloman AFB. ACC resources the squadrons to provide student initial qualification training and instructor upgrade training but leaves out other requirements. The PFT manager communicates these discrepancies, but lacks authority to institute changes. Currently, FTU squadrons do not receive BCE credit for instructing Transition 2 and 3 courses for returning fliers. Daily launch and recovery operations and instruction incur a daily bill but are not reflected either. ACC tasked the two MQ-9 squadrons to transition the 6th ATKS instructor cadre from MQ-1s to MQ-9s, but the squadrons have not received additional resources.[6] New MQ-1 instructor pilots do not have 250 instructional hours, and, in accordance with AFI 11-2MQ-1&9, they require 50 hours flying the MQ-9 before upgrading. The PFT program does not account for this deficiency. Measurements tracking a squadron's instructors distort reality as well. A student in Flight Instructor Upgrade Training (FIUT) drains resources until qualified but counts against the squadron's Unit Manning Document (UMD) immediately after in processing. Upgrading instructors quickly alleviates the burden, but backlogs penalize squadrons twice. Ultimately, operational commanders and staffs plan and expect squadrons to achieve 120 BCE per year, but capacity only meets 78% of actual requirements. To meet expected output and cover additional requirements, each FTU squadron needs five additional qualified instructors, an 8% UMD increase.[7]

A few equipment challenges on the horizon will decrease BCE output to an unknown extent. The AF has scheduled MQ-9 Block 5 aircraft and Block 30 Ground Control Station cockpit upgrades in 2017. Current aircraft software is several generations behind operational units' software and is planned for upgrade

[6] The AF recently renamed the 6th Reconnaissance Squadron as the 6 Attack Squadron.
[7] Major Derek Benkoski (49th Wing Programmed Flying Training manager), interview by the author, 6 January 2017.

812 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

as well. Instructors welcome these upgrades, but disruptions to aircraft availability, additional instructor training, and an updated syllabus will adversely affect student output. More simulators known as the Predator Mission Aircrew Training System (PMATS) will supplement current inventory, but it still falls short of requirements. Twelve operational PMATS are scheduled for March 2017, but unofficial PFT models forecast that eighteen are needed.

As a result, MQ-9 student production falls further behind, and prospects for erasing the deficit are overly optimistic. To lessen the widening gap between desired and actual production, the FTU surged in 2016. The FTU increased its student output from 280 BCE to 449, a 60% gain.[8] MQ-1 student production, which is healthy, masked the true gains. Col Robert Kiebler, the 49th Wing Commander who instituted the surge, called the plan unsustainable. Surge operations max out instructors routinely averaging 7 to 8 instructional events per week. Instructor events include academic instruction, phase briefs, simulator instruction, and flight instruction. To squeeze more productivity out of an instructor, squadrons introduced "super sorties," where two students share a single sortie. Initial calculations showed squadrons must surge to 2018, but the surge efforts continue to fall short. Figure 4 highlights the widening gap between required and expected effectiveness. As the situation worsens, the wing recently started advertising days behind the timeline to increase awareness. With the surge, MQ-9 students still graduate 25 days behind schedule. Students attend MQ-9 training as a temporary duty (TDY). Additional TDY days cost the AF $2.7 million per year. And despite all these stop-gap efforts, still there is a yearly shortfall of 24 pilots per year, roughly half an operational squadron.

813 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

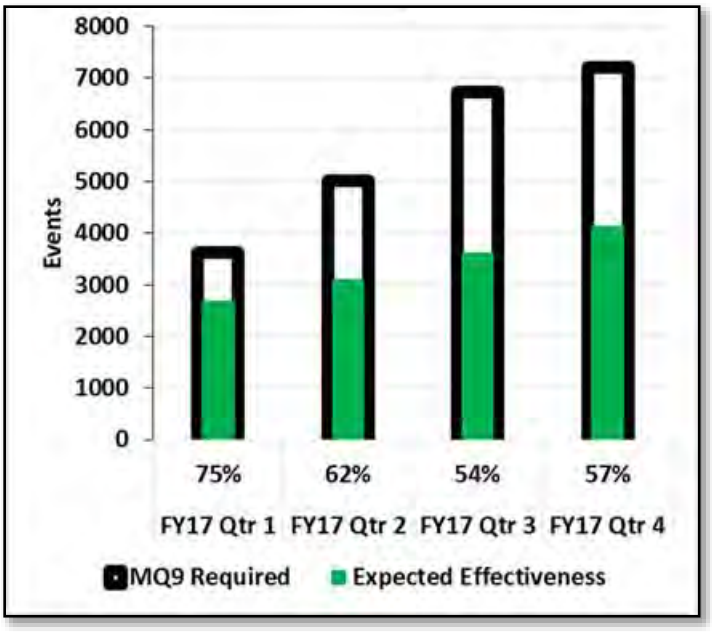

Figure 4: MQ-9 Projected Effectiveness for Fiscal Year 2017
Source: Major Jonathan Ferro and Major Derek Benkoski. Issues for the MQ-9 FTU: FY17 & Beyond. 2016.

Studies investigated launching a fourth FTU squadron, but two reasons drove recommendations to remain at three. One, the overhead costs and time to build a larger instructor cadre reduce current resources, exacerbating the immediate situation without seeing gains until much later. Consultants paid to recommend courses of action assess that the 49th Wing would see a net gain in 2022. Second, four FTU squadrons at full capacity surpass demand and overwhelm anticipated operational requirements. A wing of four FTU squadrons could train 334 pilots above that currently required, and would produce an extra 206 pilots once in sustainment mode.[9] Three FTU squadrons can produce 360 BCE, 145 more pilots per year than required to sustain operations once at full instructor strength.

To summarize, at current operating levels, the 49th Wing is unable to produce the expected number of qualified students. Without allotting more resources or resetting expectations, the surge strategy will not resolve the

[9] Booz, Allen, Hamilton. *Remotely Piloted Aircraft Pilot Production Pipeline Study Final Report*, 2016, ii.

814 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

shortfall, and adding another training squadron will likely add too much capacity and take too long. Schein includes repair strategies as a step that groups cycle through as they adapt. The Air Force typically prioritizes operational requirements over other needs. In this case, training shortfalls affected combat squadrons' ability to sustain 65 combat lines. By convincing the Secretary of Defense to authorize a temporary reduction to 60 lines, the AF took remedial action and demonstrated its value on training. In an interview, an instructor pilot assessed his squadron morale as higher than his sister squadron's due to better perceived training, despite being further behind the timeline. Such an insight discloses deeper cultural values: training trumps time. In managing internal integration, staffs have yet to resolve boundaries and communicate work expectations. Power and authority reside at Air Combat Command and Headquarters Air Force staffs, but the knowledge and management reside locally at Holloman AFB. Leaders recognize that Air Combat Command's RPA branch is not structured to handle student training issues, and will transition the 49th Wing to Air Education and Training Command in 2018.

Second Step: Improve/Refine Pipeline

Another way to train more students is to increase pipeline efficiency or decrease its length. But, the current syllabus' sequential structure creates barriers to this solution. Rather than branching and opting students to several progression tracks, prerequisite events slow class progression. At the conclusion of each phase, classes regroup for academics and phase briefs. This forces students ahead of their class to wait. The two latest MQ-9 IQT syllabus iterations increased its scope, number of events, and time. The previous syllabus needed 49 training days; the current one requires 77 days, but takes 90 days due to attrition; and the draft syllabus on its way to approval needs 92. Air Combat Command resists cutting requirements deemed necessary by operational squadrons at syllabus review boards. As more training creeps into each IQT syllabus iteration, the FIUT syllabus has expanded 400%.[10] In response, the 49th Operations Group has

[10] Booz, v.

815 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

waived a third of flights and shifted them to the simulator. The increased syllabus drives more time and resource investment precisely at a time when both are limiting factors.

Previously, course start dates were haphazard. A concerted effort to coordinate start dates between the squadrons to offset airspace, aircraft, simulator, and academic instruction requirements has increased efficiency. Trying to find more efficiencies like this prompted the AF to contract with the Booz, Allen, Hamilton (BAH) consulting company to study the process and make recommendations. Completed in 2016, their report included multiple proposals to streamline training which, according to their analysis, is the best approach to achieve the manning required within time constraints to operate sustainably.[11] The study notes that the most impactful and timely way to increase production is through reduced flying sorties, increased simulator sorties, and reducing duplicated training between URT and the FTU. These measures should have immediate impacts.

The report identified that the AF needs to conduct a formal, end-to-end training needs assessment (TNA) and training systems requirements analysis (TSRA). The two standard procedures define the required skills and determine the appropriate curriculum, delivery methodologies, and training devices appropriate to produce a basic qualified RPA pilot. Both studies are mandatory but not accomplished due to high operations tempo. Currently, the ACC Training Support Squadron Detachment 2 hosts syllabus review conferences to identify training requirements. Bringing together operational and training squadrons to identify requirements and shortfalls helps refine syllabi, but no agency has performed a technical or cost benefit analysis to assess the cost of proliferating mission requirements or judge how instructors should accomplish the syllabus. Surveys and conferences reflect institutional culture and values more than true technical training requirements. As an example, an Air Force Research Laboratory study in 1998 reported that most RPA pilots felt T-37 training was

[11] Booz, i.

816 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

absolutely necessary to fly military aircraft- a demonstrably false impression, as the AF has since learned.

Training Task List	Not Applicable (1.00 - 1.50)	Nice-to-have < Necessary (1.63 - 2.38)	Absolutely Necessary (2.43 - 3.00)
T-3 Flying	8 (15.1%)	10 (18.9%)	35 (66.0%)
T-37 Instrument Training Maneuvers	0 (0%)	12 (28.6%)	30 (71.4%)
T-37 Navigation Training Maneuvers	0 (0%)	11 (26.8%)	30 (73.2%)
FAA Instrument Rating	0 (0%)	10 (35.7%)	18 (64.3%)
Predator Ground Control Station	0 (0%)	0 (0%)	23 (100%)
Predator Flying	0 (0%)	0 (0%)	38 (100%)
All Tasks	8 (3.6%)	43 (19.1%)	174 (77.3%)

Figure 5: Task Criticality as Assessed by Air Vehicle Operators in 1998.
Source: William C. Tirre and Ellen M. Hall, USAF Air Vehicle Operator Training Requirements Study (Brooks AFB, TX: AF Research Laboratory, 1998), 4.

As Booz, Allen, Hamilton noted, "As a result [of no formal requirements review], there is not a widely accepted understanding of the required capabilities RPA pilots should possess at Initial Qualification, nor agreement on appropriate curriculum and training methods to efficiently and effectively produce qualified RPA pilots."[12]

Though not an official TRSA, the Booz, Allen, Hamilton report argues to replace more flights with improved simulators to streamline the course and reduce redundancy between URT and the FTU. Figure 6 depicts BAH's recommendation to combine URT's RFT and RIC and shift RFC to the FTU. BAH concludes this is the most immediate and productive course of action available, but its authors fail to address how streamlining will increase production if the FTU's bottlenecks remain. In addition, the study recommends transferring Reaper IQT from ACC to AETC, a recommendation the AF accepted and plans to do in 2018. This will have two effects: it will establish unity of command for the entire production process, and it will introduce increased staffing overhead as

[12] Booz, iv.

817 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

AETC brings its established manpower model to the FTU. The study echoes the 49th Wing PFT manager's assessment. It concludes that while the surge is beneficial, current FTU output is insufficient to make short-term improvement to the existing shortfall.

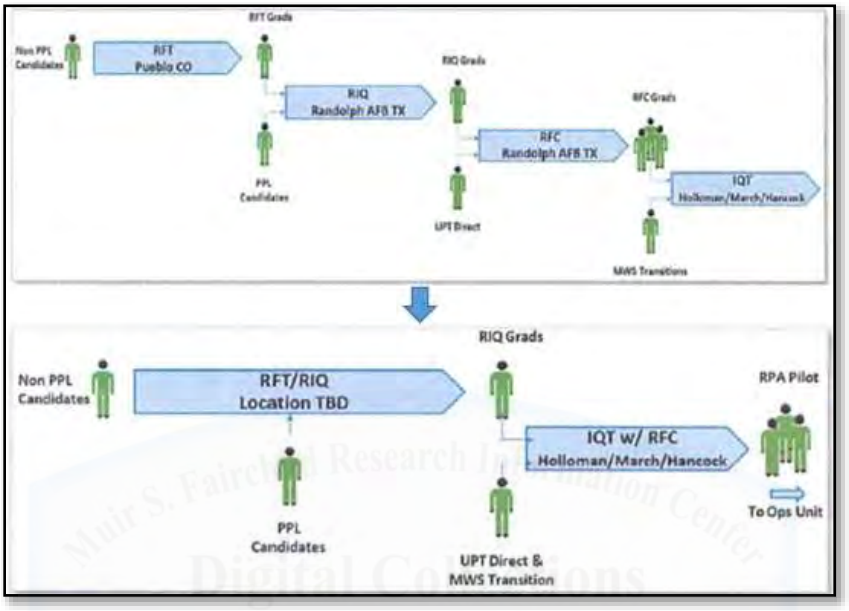

Figure 6: Streamlining RPA Pilot Production by Restructuring URT Sub-phases across URT and FTU. Source: Booz, Allen, Hamilton. Remotely Piloted Aircraft Pilot Production Pipeline Study Final Report, 2016, ii.

According to Schein, training is a visible organizational process, and, as an artifact, what it represents can be hard to decipher. In this case, the AF has shown a clear preference to ensure quality training across burgeoning mission sets rather than emphasizing quantity of graduates. Commanders have not elected to streamline training or combine courses despite recommendations. The reality of limited resources has forced leaders with the tough choice to pare back flight requirements, choosing production over quality. These reluctant choices are waivers and exceptions that reflect a reluctant, temporary value judgement.

818 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

Third Step: Stop Impending Attrition

> *In April 2014 we also found that the Air Force may face challenges retaining UAS pilots. Pilots in 7 of the 10 focus groups we conducted at three Air Force bases indicated that retention of UAS pilots is or will be a challenge and UAS unit commanders in one location we visited and other Air Force officials stated that they were concerned with future retention rates of UAS pilots. As mentioned above, we recommended that the Air Force develop a tailored strategy that addresses both recruiting and retention of UAS pilots and the Air Force concurred.*
>
> Ms Brenda Farrell, Government Accountability Office's Director of Defense Capabilities and Management, testifying to Senate Armed Services Committee

Manning is also affected by outflow. The AF follows a typical pattern where demand is miscalculated, overproduction overcorrects, and then personnel separate. This induced oscillation has yet to visit the RPA community. Up to this point, outflow has been in form of completed Alpha tours, retirements, and 11U pilots (SUPT graduates) separating from the AF.[13] URT carries a 6-year Active Duty Service Commitment. Because 2018 will mark the first URT class' ADSC expiration, attrition within the community does not have any historical data to serve as a guide, and Headquarters Air Force A1, responsible for manpower projections, refuses to forecast attrition; it only uses actual data.[14] Using historical data works in other established communities, but not in the RPA community, where no such data exists. Organic research anticipates a grim outlook: the forecast is 64% overall 18xx attrition amongst those whose commitment is ending. That translates to 31% of the RPA pilot community that is expected to separate in 2018 (118 pilots) and 2019 (163 pilots). Currently, the MQ-9 Aircrew Retention Program (ARP) has a take rate of 36% compared to the AF pilot average of 59%. If the low take rate is a leading indicator of retention,

[13] Alpha tours are tours of duty away from a pilot's primary aircraft. Alpha tour options include pilot training, Introduction to Fighter Fundamentals, Air Liaison Officer, and RPAs. The AF recently discontinued RPA assignments as Alpha tours. At the conclusion of an Alpha tour, pilots typically return to their primary aircraft.
[14] Keebler, 2016.

819 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

then the FTU should anticipate a dramatic correction in production in the coming years.

To preempt an exodus, the AF instituted multiple initiatives and a Culture and Process Improvement Program (CPIP). Dubbed the RPA get-well plan, 57 initiatives aim to achieve a community-wide 10:1 crew to combat line ratio and 100% FTU manning. This wide-reaching plan addressed ten different areas. Ones that address retention include decreasing operational requirements and increasing pay. Secretary of Defense Ash Carter approved a reduction in combat lines from 65 to 60 in order to alleviate the RPA community's state of constant surge. This freed a squadron's worth of manning to relocate to Holloman AFB. Moreover, the Secretary of Air Force rapidly implemented a $1500/month flight pay increment for the handful of RPA pilots whose commitment had expired. Then, once routed through Congress, the AF offered an increased retention bonus of $35k per year. General David Goldfein, CSAF, acknowledged the bonus as a crucial step to help "retain these valued aviators to execute our current operations and shape the future."[15] Reducing combat lines took buy in from the Secretary of Defense and required the AF admitting it could not meet combatant commanders' needs. The AF's institutional preference was to reduce combat capability rather than to reduce training requirements. The AF responded to a manning shortfall with an oft-repeated technique: the bonus amount equals fighter pilot bonuses, signifying parity and recognition.

Meanwhile, Culture and Process Improvement Program focuses on community standardization and stabilization. The program formalizes the squadron, group, and wing structure across the AF, stands up a new wing and operations group, establishes a dedicated launch and recovery squadron, builds dwell time, renames reconnaissance squadrons to attack squadrons (ATKS), and

[15] Secretary of the Air Force, *RPA Pilots Set To Receive $35,000 Annual Bonus*, 2016, http://www.af.mil/News/Article-Display/Article/911383/rpa-pilots-set-to-receive-35000-annual-bonus/.

820 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

allows logging combat time.[16] A standard squadron will now consist of four combat lines; an ops group will consist of three combat squadrons and an OSS; and a wing will add a maintenance group and a launch and recovery squadron. Additionally, through CPIP, another wing and operations group will stand up, and, as announced in December 2016, one of those will be at Shaw AFB.[17] Dedicated launch and recovery squadrons allow Mission Combat Element (MCE) squadrons to focus on their combat mission without additional overhead from launch and recovery training and deployments. The realignment in responsibilities also allows LR squadrons to develop experience and retain trained personnel in the squadron. Other communities use a deploy to dwell metric to measure aircrew strain. The RPA community is adopting this metric to rotate squadrons out of combat lines to reconstitute and train. Ultimately, CPIP aims to create sustainable and predictable working conditions in an environment that has been anything but that over the past decade.

The two plans have reinforcing objectives. Normalization is the process of bringing something to a normal condition. Here, it brings RPAs into the AF's fold, but it also demonstrates that the larger AF is reevaluating its beliefs. Through CPIP, the AF signaled to RPA pilots and sensor operators their institutional value. Logging combat time reflects the AF's growing understanding of the significance and honor involved in remote warfare. Changing squadron names better conveys the multirole missions tasked to these squadrons.[18] Combat RPA squadrons belong to Air Combat Command and AF Special Operations Command, and both commands treasure their kinetic capabilities. While only a cosmetic move that requires new patches and signs, the renaming moves RPA "Attack" squadrons closer toward a shared identity with Air Combat Command's

821 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

fighter squadrons. As more and more cultural artifacts overlap between the sub-communities, the grayer the distinction becomes between them.

Increasing squadrons, groups, and wings achieves multiple objectives. First, more units mean more leadership opportunities and therefore more promotions. More promotions translate to more advocacy via more RPA flag officers and more staff officers exercising influence. Second, having more squadrons enables units to rotate out of combat lines to train and reconstitute. Dwell time provides a respite from shift work and an opportunity for squadron events, upgrade training, and continuity training. Operational squadrons previously accomplished training in an ad-hoc manner in a combat zone, a unique feature to the RPA community. Rotating out of combat sorties like other communities allows operational units to adopt standard upgrade and continuity training practices. The initiatives also clarified unit manning by linking personnel requirements to a desired capability.

The two plans together are the AF's response to operate, train, and equip RPAs; they also are significant steps toward integrating the RPA community. An organization makes assumptions about managing internal integration. Schein states that power, status, group boundaries, rewards, and common language are areas where an organization discloses those assumptions. While no definitive prescription can account for individual decision-making, how an organization approaches retention reveals much about the organization's culture and values. By allocating pilot-level bonuses and flight pay, the AF has signaled its level of commitment to its RPA pilots. Borrowing from other communities' best practices moves the RPA closer to resembling manned flying operations and reduces cultural boundaries separating manned and unmanned platforms. Renaming squadrons and adopting a deploy-to-dwell metric reframes RPA's conceptual category and introduces more language commonality with manned aircraft squadrons. It demonstrates an inclusionary if unimaginative effort to promote the RPA community's sustainability and belongingness. Such measures are a welcomed departure from previous manpower decisions.

822 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

Recap

Corporately, the active duty AF views its personnel system as a conveyor belt that loads recruits onto one end, uses them, and returns them back to society years later at the other. To maintain the health of the community, a steady flow of accessions ideally matches the same steady flow of separations. The AF prizes experience and therefore predictability. Once experience leaves the conveyor belt, it is gone, and the AF cannot hire an immediate substitute to replace the loss. By anticipating levels of attrition along progressive year groups, the AF can respond by loading more recruits onto the conveyor belt and trying to keep existing personnel from falling off. The RPA community's young existence means that the expected pull of separations is unknown. In anticipation, the AF has not stood by idly.

Managing the training pipeline is a response to the uncertainty of intrinsically uncontrollable or difficult events. Each decision tests the validity of corporate AF values. If the initiatives are successful, they will reaffirm corporate values and beliefs. But, if they are not, the RPA community will question and reexamine its deepest fundamental assumptions.

Chapter 3

Army UAS Training

Our identity is strengthened through education, training, and experience.

Department of Army's
The Army Profession

Tension between the Air Force and the Army started before the National Security Act of 1947 when the Air Force became an independent service. Prior to and through World War II, there was suspicion, if not outright hostility, between many air and ground commanders over what equipment to acquire, how to allocate resources, and how to prioritize missions. Air Corps leaders, with the tangibly close realization of an independent Air Force, chose to "throw as much into bomber and pursuit forces as they could" to emphasize strategic bombardment to the detriment of air-ground integration.[1] Ground commanders viewed the effort as imbalanced and unsatisfactory and looked to find a solution.

The Secretary of War on 6 June 1942 ordered the formation of organic aviation assets to support artillery observation. Earlier, Major General Mark W. Clark, Lieutenant General McNair's Chief of Staff in Army Ground Forces, had approved and passed the recommendation to the War Department without McNair's knowledge.[2] When McNair discovered what had passed, he did not protest, and the War Department accepted the recommendation. Lieutenant General Henry H "Hap" Arnold vehemently opposed the move. Arnold argued to no avail that putting light planes in the ground forces would effectively "create a separate Air Force in the Army and that such a thing was unthinkable."[3] The budding Army Air Forces strived for centralized and unified command of air forces. The Army conversely had taken steps to decentralize control of air assets to ensure ground commanders received the reliable support they deemed necessary. A few months later in November 1942, Army aviation units entered into

824 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

combat on the North African coast to adjust artillery fire, gather intelligence, support naval bombardment, and direct bombing missions.

A nearly identical scene played out in 2007 in Operations Iraqi Freedom and Enduring Freedom. As mentioned in Chapter 1, General Petraeus' counterinsurgency and nation-building strategy dictated a surge and a need for more ISR. The USAF's failure to meet the Army's growing Reconnaissance, Surveillance, and Targeting Acquisition (RSTA) needs can be attributed to a lack of assets and to servicing higher priority requests, such as special operations and supporting troops in contact with the enemy. Colonel James G. Rose, Commander of Army Intelligence in 2007, observed, "Current and envisioned non-Army UAV systems are limited in their ability to provide responsive support to various requesting ground-maneuver units based on limited assets. When units were successful in requesting UAV support, communications problems, delays in data receipt, and retasking procedures/authority decreased the effectiveness and responsiveness of the UAV system."[4] With Secretary Gates' support, the Army procured an organic medium altitude, long endurance UAS capability to ensure future reliable ISR support despite Air Force protests.

As introduced in earlier chapters, examining an organization's artifacts, values, and underlying assumptions to understand organizational culture lends insight into current and future decision making. Army Headquarters states in its Army Regulation 350-1, "All training and leader development actions occur within the Army culture, a culture which embraces values and ethics, the Warrior Ethos, standards, and enduring principles and imperatives. Army training strategies serve to synchronize the role each training domain plays in building force readiness."[5] Thus, an organization's cultural origin is an important first step to understanding how it makes decisions.[6] Next, "from an evolutionary perspective, we need to identify the issues that any group faces from the moment of its origin through to its state of maturity and decline."[7] This chapter will use Schein's framework to examine Army UAS training, how it has dealt with its external

environment and managed internal integration. The chapter will conclude by identifying the underlying assumptions, values, and artifacts tied to the organization.

Army UAS History

The Army generally views UAS as a valuable support tool, and the desire is to decentralize control and maximize autonomy and reliability. Beyond that, though, little controversy surrounds the program, especially in comparison to the USAF. The Army's training program values practicality, is more affordable, and requires less time. Consequently, civilian leaders use it as a measuring stick to scrutinize the Air Force's more expensive RPA training pipeline.

The Army's involvement in unmanned aircraft goes back to 1918 and Charles Kettering's Bug. In World War II, the Army developed drones for anti-aircraft target practice, and in the Cold War, the Signal Corps tested various reconnaissance platforms at Fort Huachuca, Arizona. In 1955, they introduced the RP-71, a precursor to the Shadow UAS.[8] It solved many ground commanders' problems with airborne reconnaissance: it launched rapidly, it imbedded with ground forces, and personnel quickly gathered and processed intelligence for immediate use by the commander. From the RP-71 came the SD-1 through SD-4 variants, but ballooning costs, an inability to overcome technical hurdles, and poor performance convinced the Army to cancel the programs. The Army and its industry partners then made little headway during the Vietnam War. The next significant UAS iteration for the Army was the Aquila in 1975. Before its cancellation in 1987, the program demonstrated significant capability leaps in its sensor and data-link packages and laser designation capability. The Navy and Marine Corps would continue Aquila's next iteration with the Exdrone, which they employed as the renamed the BQM-147 Dragon in Desert Storm.[9] Significant, cost effective, sustainable capabilities emerged shortly thereafter. The Army finally ushered in the drone age as it is known today when it fielded its RQ-5 Hunter UAS in 1995.

The first Army UAS operator was Master Sergeant Mark Farrar, now the 2-13th Aviation Regiment's Director of Training as a GS-14 employee. As he recounted, in 1986, the Training and Doctrine Command's (TRADOC) System Manager, Colonel Ted Fictel, formed a UAS Task Force consisting of 5 NCOs with broad latitude to "figure out how to integrate UAS into the Army."[10] The Colonel selected then-Sgt Farrar, with expertise in communications and stationed at the Army's Center for Military Intelligence in Fort Huachuca, Arizona, to the team. Other team members had expertise in aviation-related ground maintenance, aerial image observation, photo interpretation, and aerial maintenance. Although given flexibility, their budget was minimal. With it, they purchased and built several remote control (RC) aircraft kits. Serendipitously, an avid RC enthusiast and civilian, George Makowitz, was serving at Ft Huachuca as an interrogator. The team tapped into his expertise, and all learned to fly from him.

The group connected with a Marine Corps project officer, Captain Allan Watt at the Johns Hopkins University's Applied Physics Lab (APL). The Marine Corps had contracted with APL to develop an amphibious, expendable jamming platform. Capt Watt had a prototyped delta wing drone, the Exdrone, and he relied on APL's one qualified pilot for flight tests. The Army and Marine Corps began a collaborative relationship at Ft Huachuca, where restricted airspace and good weather permitted consistent flight operations and surrounding hills blocked electromagnetic interference.

[10] Farrar interview.

828 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

The Marine Corps' payment was equipment, and the Army provided the operators, the developmental team, the runway, and airspace. The successful partnership achieved multiple milestones. The group achieved two long distance world records with handovers coordinated by line of sight radio communications. The Exdrone deployed to Desert Storm as the Dragon drone, and after successful testing, the intrepid group declared Ft Huachuca the Department of the Army's Unmanned Training Center. The title stuck when no one disputed the claim. The Army and Marine Corps continue to jointly train enlisted operators on the Shadow UAS.

Thus far, Army UAS had been small, entrepreneurial, innovative, and practical. Each UAS Task Force member had a specialty, and overlap developed as the team gained experience. Operators flew, conducted maintenance, and solved overlapping problems in radio or camera control or navigation. As the platform matured, the team wrote and amended a curriculum for future operators with each subject matter expert handling their respective section. The syllabus reflected their personal RC aircraft experiences and expectations of Army employment. The Army's first UAS company conducted both combat operations and testing. Operators visually accomplished takeoffs and landings. Personnel cross-trained to conduct maintenance while standing by for unplanned early recoveries. At that time, personnel were selected based on their maintenance aptitude. To that point, external pressures brought few fiscal resources and little oversight, and its initial success reinforced the decision to use NCOs and to work from small, hobbyist RC aircraft toward larger and more sophisticated UAS. Specialized NCOs able to perform generalized tasks across the spectrum of operations continued to be the UAS cornerstone.

In 2005, Military Intelligence Commanding General, Major General Barbara Fast, and Aviation Branch Commanding General, Brigadier General E.J. Sinclair, argued for UAS proponency within the Army. UAS had grown under MI, and MG Fast wanted to maintain control of the payload operator to ensure imagery responsiveness. UAS had been a boon for intelligence communities, and they jealously guarded such a capable asset. The emerging capability did not always escape cultural inertia; in MI's case, it surfaced in an unsuspecting way. As a case in point, imagery training occurs at Ft Huachuca, and for 2 years, black and white image interpreters successfully blocked upgrading the Shadow's camera to color full motion video.

829 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

Despite MI's best efforts, on 19 Apr 2006, Aviation Branch took proponency of the operation they referred to as the "R/C club at Ft Huachuca." Aviation Branch intended to bring UAS in line with best aviation practices, and they had maneuvered to keep the crew dual qualified to aid flexibility and crew coordination. In reality, two things happened. One, the UAS program began to professionalize and normalize to Aviation Branch standards. Safety and maintenance records dramatically improved, but the shift was not to everyone's liking. Some tenured instructors bemoaned the move away from efficiency, innovation, and dedication. Two, in reorganizing, the UAS community lost a powerful advocate in Military Intelligence. Under MI, UAS brought a unique capability to the sub-culture, and its operationalized intelligence was prized. The reorganization under Aviation Branch established a pecking order similar to the USAF's situation with RPAs, and, similarly, UAS found itself at the bottom. Career Aviation Branch helicopter pilots without UAS experience rotated through officer leadership positions. The training center remained at Ft Huachuca and fell under 1st Aviation Brigade at Ft Rucker. The geographic separation hurt UAS advocacy, and it turned UAS training into an island on Ft Huachuca. Practically, this translated to lack of resources as prioritized by the Aviation Branch. The 2-13th Aviation Regiment must negotiate launch and recovery windows at Libby Airfield with tenant units and USAF squadrons at Davis Monthan AFB, AZ. Obtaining range time has been problematic as well, but as Forces Command (FORSCOM) and National Guard units ramp up UAS training at Ft Huachuca, range priority has increased.

In 2009, Army enlisted operators started flying the Warrior A, essentially an MQ-1 Predator, until Gray Eagle was fielded. Initially, they flew MQ-1s owned by Big Safari, the Air Force's rapid procurement force that oversees the acquisition, modification, and logistics support for special purpose weapons systems. At the Army's behest, General Atomics added point and click interaction to achieve ease of use and efficiency as well as an auto takeoff and land feature. Before the upgrade, warrant officers performed takeoffs and landings and handed off control to enlisted "cruise" operators for the mission. General Atomics lengthened the wings and added 2 hard points to allow the Gray Eagle to carry 4 Hellfire missiles. Increases in autonomy allowed Gray Eagle operations to have an enlisted, universal operator capable of

830 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

executing all aspects of aircraft and payload control. Wider Army efficiency practices drove universal maintenance personnel to work on all UAS and universal ground control stations to operate Shadow and Gray Eagle. Simplicity of operations has strong value in the Army and has allowed it to maintain a widely trained force. Interoperable equipment, operators, maintainers, and UAS procedures will result in further dispersed UAS control beyond Army Aviation Branch.[11]

Current Army UAS Employment

A divisional Gray Eagle company is assigned to each of the Army's active duty Combat Aviation Brigades to provide ground force commanders organic reconnaissance, surveillance, security, and attack capabilities. Additionally, two larger Gray Eagle companies are assigned to Intelligence and Security Command (INSCOM), and two are assigned to Army Special Operations Aviation Command (ARSOAC). The companies organize to deploy as a standalone unit and conduct operations from one or more locations within their division area of operations. Each company consists of 127 soldiers and 12 air vehicles. With the company collocated, it can provide six simultaneous 24-hour missions per day. When geographically split, it can provide four to six combat lines.

In the development of UAS, the Army chopped its organic assets to divisions, with actual control delegated down to Brigade Combat Teams (BCTs). Gray Eagle followed this model. In a nearly opposite operational approach to the USAF, this can theoretically mean launching a Gray Eagle from an established runway away from the battlefield and then performing a line-of-sight handover to the division. In practice, however, once operators launch via line of sight control, they transfer the aircraft to KU band satellite control and continue flying the mission. USAF operators deal with the stigma of remoteness, but the Army operators embed as a platoon or company in a deployed combat aviation brigade (CAB). As UAS capabilities increase, CABs grow more accepting of enlisted operators' contributions and take concerted efforts to include the operators in collective training and missions. A unique outflow of these efforts and

[11] Major Ariel Schuetz (US Army TRADOC UAS Capabilities Manager), interview by the author, 3 March 2017.

831 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

organizational structure is that "these platoons are employed with the AH-64 Apaches to execute manned/unmanned teaming for enhanced reconnaissance, security, and attack operations."[12] This present model dominates, but current events may morph this concept of operations closer to USAF methods, especially with INSCOM and ARSOAC formations.

Recent ISR Request for Forces (RFF) tests the Army's organic model. According to General David G. Perkins, the current Training and Doctrine Command (TRADOC) Commanding General, "Although designed to support Army division requirements, these formations have been recently deployed in support of combatant commanders separate from their divisions."[13] The Army responded by creating Gray Eagle companies at echelons above division (EAD) designed to conduct split operations. Assigned to both the Intelligence and Security Command (INSCOM) and the Army Special Operations Aviation Command (ARSOAC), these Gray Eagle companies have 165 soldiers and 12 air vehicles. Currently, the Army fields three Echelons Above Division (EAD) Gray Eagle companies and plans to stand up one additional company this year.[14] These companies are specially organized, trained, and equipped to conduct long-endurance, extended range, multidiscipline intelligence, and precision strike operations to provide timely intelligence and destruction of high value targets in joint organizations. Enlisted soldiers and warrant officers rotate through these units and conventional Army units throughout their careers.

Assigning organic UAS to divisions allows flexibility, but it has efficiency and expertise costs in operations and training. The Army's Human Resources Command assigns soldiers to either a BCT, CAB, or EAD after completing initial UAS training with no additional unit specific training. The gaining units incorporate soldiers into their operational unit's aircrew training program (ATP), which is designed to produce fully mission trained, combat-ready crewmembers. This training, specifically Readiness Level (RL) 2, parallels the Air Force's Combat Mission Ready (CMR) training conducted at the

[12] Statement of General David G. Perkins, USA in "Army Unmanned Aircraft Vehicle and Air Force Remotely Piloted Aircraft Enterprises," unclassified testimony before Senate Armed Services Committee (Washington D.C.: 16 March 2016).
[13] Statement of General Perkins, 2016.
[14] Statement of General Perkins, 2016.

832 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

operational squadron level. RL 3 parallels an AF squadron's continuation training. The level of ATP training differs dramatically with each unit; BCTs have the least training, followed by CABs, followed by INSCOM and ARSOAC.

The ATP focuses on task proficiency to enable the execution of the unit's mission essential tasks. The process consists of progressing through three readiness levels (RL). Graduates from Fort Huachuca operate to an RL 3 standard. RL 3 focuses on training and demonstrating proficiency in basic launch, recovery, and flight tasks. RL 2 is specific mission training and focuses on training and demonstrating proficiency in those tasks required to execute missions. These tasks include reporting, air-ground operations, acquiring and engaging targets, conducting reconnaissance, and MUM-T. The third progression level is RL 1, continuation training. Once designated RL 1, the UAS crewmember is expected to maintain proficiency in base, mission, and special unit tasks by accomplishing semiannual and annual critical task iterations as well as meet semiannual flying hour minimums. RL 1 crewmembers must also pass an annual standardization flight evaluation and written examination.[15]

In testimony to the Senate Armed Services Committee, General Perkins reported difficulties achieving and maintaining RL 1. Operational Gray Eagle companies have a dismal record maintaining required readiness. Installations that maintain UAS assets do not necessarily have the appropriate infrastructure like airspace or Ground Based Surface to Air Avoidance (GBSAA) set up to permit transiting, the frequency spectrum needed to control its UAS, or suitable weather for consistent flying. After graduating from training at Ft Huachuca, young operators may not fly again for several months if they are assigned to divisions during initial fielding or if the installation is not properly equipped to support operations. As an example, the Army operates 104 Shadow units, and 86 failed to make their minimum flight hour requirements for various reasons.[16] Too often, the units sit boxed in the motor pool at home station, unable to train. Divisions that need ISR wartime capability collocate Gray Eagle companies regardless of whether the airspace environment is conducive to training. In the majority of locations, the companies are unable to achieve needed readiness levels. At Fort Irwin in southern California, the

[15] Statement of General Perkins in Senate, 2016.

[16] Bill Coleman (Gray Eagle Project Manager), interview by the author, 5 January 2017.

833 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

runway can only handle single direction operations. At Fort Wainwright in Fairbanks, Alaska, difficult weather reduces the flight availability window, and environmental restrictions prohibit runway de-icing. Fort Carson has the most operating difficulties. Spectrum management, access to restricted airspace, mountains, and required GBSAA support are problematic. This led one instructor at Ft Huachuca to lament, "The Army wants the capability but not to manage and harness it."[17]

Schein states that cultural assumptions evolve around all aspects of a group's relationship to its external environment. "If the environmental context is changing, such conflict can be a potential source of adaptation and new learning."[18] Assumptions about adaptation to external stimuli to enhance survival is reflected in an organization's mission and strategy, goals, means, measurements, and corrections made. The Army's stated mission is to "fight and win our Nation's wars by providing prompt, sustained land dominance across the full range of military operations and spectrum of conflict in support of combatant commanders."[19] Seen in this light, the Army's UAS approach to gain and sustain land dominance by focused air-ground integration is appropriate, but because it is a support asset, it does not demand the means it needs. As the new security environment demands greater battlefield intelligence and possibly increased standoff distance due to threat, original decisions about UAS strategy and means need revisiting. The Army has realized errors and made corrections slowly. In the case of achieving poor readiness levels, it took Congressional involvement to raise the issue.

UAS Training Description

General Perkins in his Congressional testimony plainly laid out a fundamental underlying assumption: "the centerpiece of the Army's UAS strategy is the Soldier." Army's training is well equipped and experienced in transforming young high school graduates into cohesive operating units capable of wielding advanced weaponry on command. It naturally follows that enlisted soldiers and Noncommissioned Officers (NCOs) operate and maintain the Gray Eagle. The UAS overarching mission objective is

834 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

to take entry-level soldiers and create graduates able to conduct "air reconnaissance, surveillance, targeting and acquisition missions, plan and analyze missions, perform preflight, in-flight, and post-flight checks and procedures, launch and recover aircraft, and perform maintenance on communications equipment, power sources, wheeled vehicles and crane operations."[20]

Soldiers that enlist as either UAS operators or maintainers are among the Army's most capable. Soldiers who enter the UAS Military Occupational Specialty (MOS) must achieve a surveillance and communications (SC) score of at least 105 on the Armed Services Vocational Aptitude Battery military entry exam. This score is the highest SC score for entry into any Army MOS. Based on their particular enlistment agreement, these soldiers enter with a 4 to 6 year service obligation that begins at in processing. The Army has successfully attracted qualified applicants, but retention remains a problem. Currently, the Army offers UAS operators a reenlistment bonus of $45,000 for an additional five year commitment. Those that pursue the reenlistment develop into the UAS senior NCO force.

The Army has recognized how formative initial training is, and it deliberately approaches training as an opportunity to instill values while building force readiness. According to its Training regulation 350-1:

> All training and leader development actions occur within the Army culture, a culture which embraces values and ethics, the Warrior Ethos, standards, and enduring principles and imperatives. Army training strategies serve to synchronize the role each training domain plays in building force readiness.[21]

Accordingly, while in Enlisted Initial Military Training (IMT) and Advanced Individual Training (AIT), all aspects of a soldier's life are closely controlled. They live in dormitories, conduct daily physical training, do not consume alcohol, eat at dining facilities, take bus transportation on post, and receive formalized instruction up to 12 hours per day. The 2-13th Aviation Regiment, the UAS training unit, recognizes and rewards soldiers who are "skilled, tough, and ready around the clock."[22]

835 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

Since April 2007, graduates are awarded an Aviation Badge at course completion. Major General Virgil Packett, commander of the U.S. Army Aviation Warfighting Center at the time, unveiled the renamed Crew Member Wings as the new Aviation Badge. Packett in his commencement speech recognized the inertia against recognizing UAS operations and the value the Army places on uniform insignia. The petition to recognize UAS operators began in 1992. He commented, "It's a great day... because it's been a steep hill in order to be able to recognize, with this symbol of professionalism, these wings, the troopers that stand before you today. Now they can sit a little bit taller… with that shiny piece of brass on their chests that they have so duly earned." Captain Kyle Duncan, operations officer for the UAS Training Battalion in 2007, both credited and clarified the wings' meaning. His statement was a qualified compliment:

> They are not actually in the aircraft, but they are doing aviation duties. It's a credit to their skills, the hard work they do. They deserve this recognition. They are not pilots, but they are operating in theater, in aviation. They are not getting an aviator's badge; they are getting an aviation badge. We recognize them for their work, as part of aviation.[23]

As Duncan mentioned, the Aviation Badge is not an Aviator Badge, and UAS operators do not receive flight pay or incentive pay. The Aviation Badge is also awarded to aviation maintenance personnel at the completion of the Gray Eagle maintenance course.

Viewed through Schein's methodology, the Army places mediocre value on its UAS operators. For one, Aviation Branch does not reward the young enlisted trainees with promotion into senior leadership opportunities. In fact, a disincentive exists for promotion. Once promoted to Master Sergeant, Human Resources Command (HRC) changes the 15W operators' MOS to 15Z. A 15Z MOS is non-flying, and HRC assigns these Master Sergeants to any aviation positions like airfield operations, air traffic control, UAS operations, or aviation maintenance. The platoon leader retains operational authority, and an NCO oversees flight coordination. Officers from other Aviation Branch platforms fill UAS command and staff positions before returning to their aircraft. The UAS operators receive basic pay, not flight pay or Aircrew Incentive Pay (ACIP). The

836 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

artifacts associated with UAS operations could be mistaken for any other Army unit. They share insignia with air traffic controllers, airfield operations soldiers, and maintenance soldiers. They wear standard issue Army Combat Uniforms (ACUs) in contrast to their flight suit or Army Aviation Combat Uniform (A2CU)-wearing pilot officer counterparts at Ft Rucker.

Figure 11: Army Aviation Badge

The Army more closely subscribes to the Joint Staff's minimum training guidance as spelled out in its *Joint Unmanned Aircraft Systems Minimum Training Standards* (JUMTS) than the Air Force does. The Joint Staff classifies Gray Eagle and the MQ-9 Reaper as Group 4 Unmanned Aircraft because they weigh more than 1320 pounds, predominately operate under VFR in all classes of airspace below 18,000' MSL, and prosecute ISR missions and missions as described by Joint Mission Qualification (JMQ) levels A or B. JMQ A supports unit-level ISR and fires tasks, and JMQ B supports theater-level advanced ISR. The JUMTS also spells out levels of Basic UAS Qualification (BUQ) knowledge required for each UAS group. A UAS crew must possess the general aviation knowledge and UAS knowledge-based skills to operate UAS safely as required by crew duties or position. As a minimum, regardless of UAS type, a qualified crew must be capable of airspace design and operating requirements, air traffic control procedures, rules, and regulations, aerodynamics, including effects of controls, aircraft systems and emergency procedures, performance, navigation, meteorology, communication procedures, and mission preparation.[24] BUQ Level III is the knowledge and knowledge-based skills required to fly under VFR in all airspace classes except Class A. The JUMTS for Group 4 UAS is BUQ III and JMQ B, and the Army trains to this standard.[25]

837 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

Gray Eagle training has two frequently changing phases: currently they are an 8-week common core course and a 20-week Gray Eagle course. On completion of the initial phase, the soldiers possess requisite basic knowledge and skills required prior to training on a specific UAS system as well as common aspects of UAS operations within the Army and the Department of Defense. Academics also address the overarching structure of Military Intelligence and UAS operational role. Course attrition tends to be due to behavioral rather than academic or performance related issues. The pipeline front loads academics to reduce training investment while any student-related issues are addressed. The cost breakdown per student for the Common Core course is $11k for direct instruction and $5.6k in overhead costs. Pay, allowances, per diem, and travel incurred during an 8 week course amounts to $11.8k.[26]

During Module A, UAS operators receive in-depth instruction on the fundamentals of aerodynamics, doctrine, risk management, mission planning, flight safety, and navigation. The introductory module covers all knowledge necessary for a Federal Aviation Administration (FAA) Private Pilot's License. After four weeks of ground school, students take the FAA's Private Pilot Knowledge Test. Module B focuses on aeroscout operations to include visual identification of friendly and enemy vehicles and ground-based threats, base defense, and patrol concept of operations. Modules C and D quickly address Army aviation regulations and introduce gunnery in the eighth and final week.

[26] 2-13th Aviation Regiment Report entitled *Resident Training Cost per Graduate*, 2016.

838 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

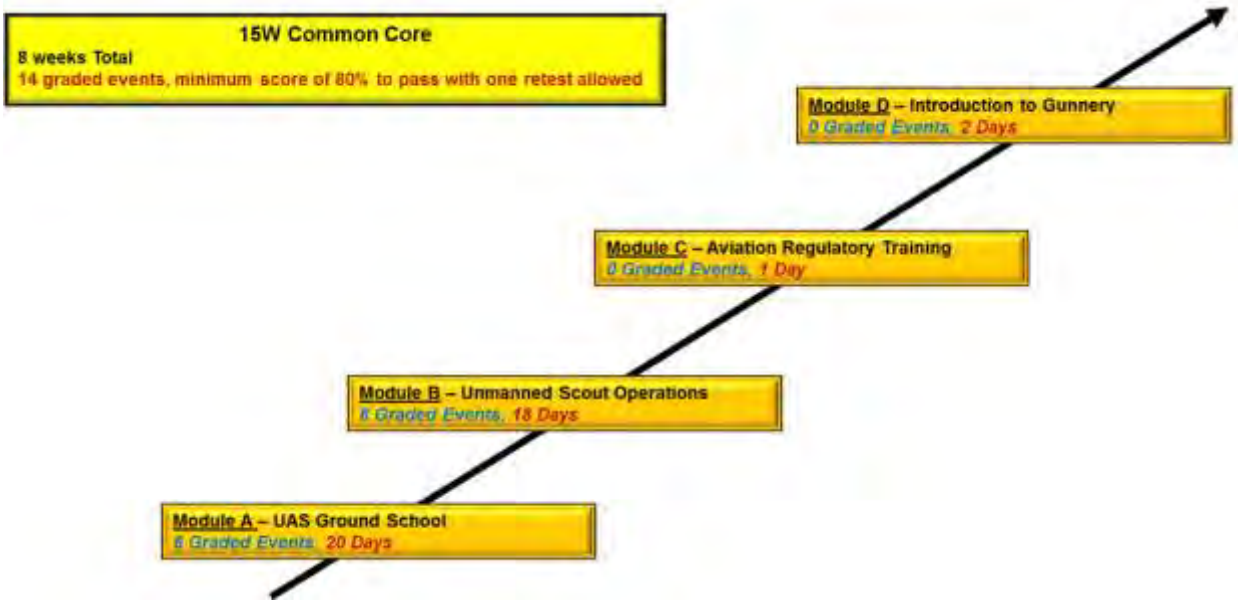

Figure 12: Common Core Training Modules
Source: 2-13th Catalogue. 15W Common Core Course Design. 2016.

After completing the Common Core, students track either to Shadow or Gray Eagle training. Previously, all students gained experience in the Shadow before progressing to the Gray Eagle. Upon graduation of either track, UAS students are expected to mission plan, prepare and conduct air reconnaissance missions, preflight, launch, remote pilot and recover an aircraft, perform emergency procedures, perform tactical and administrative radio communications, operate sensors for target detection, deploy ground and air systems, conduct maintenance/inspections on communication equipment, and be familiarized with gunnery operations. The Gray Eagle course consists of 8 modules and 680 hours of academic and flight instruction across 25 total weeks. The schoolhouse conducts six classes of sixty students per year. To train 360 students per year requires 24 hour operations, and instructors as well as aircraft are fully utilized. The cost breakdown per student over 25 weeks is $140k for direct instruction and flying costs. Overhead costs and student pay, lodging, and travel add an additional $41k.[27]

[27] 2-13th Aviation Regiment Report, 2016.

839 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

Figure 13: Gray Eagle Training Modules
(Source: 2-13th Catalogue. 15W Common Core Course Design. 2016)

Currently, Gray Eagles operate exclusively in combat zones or restricted airspace unless granted a domestic Certificate of Authorization (COA) to transit with chase aircraft or observers. To enable further national airspace integration, Module G has shifted to emphasize and practice IFR flight. Renamed as Module A, the phase now consists of 57 hours of instruction and covers instrument flight rules, practical exercises, and a performance evaluation.

Officer and warrant officer platoon leaders supervise enlisted Gray Eagle operators. The schoolhouse conducts four week courses to transform incoming lieutenants into UAS platoon leaders. The overarching objective is teaching how to manage and supervise UAS personnel, programs, and operations in wartime and peacetime situations. Topics covered include understanding mission-essential UAS systems, equipment operations, and capabilities; applying aviation doctrinal concepts during different phases of UAS operations, mission planning, and execution; and advising the commander in the use of UAS assets. Additionally, the 2-13th Aviation Regiment teaches a 3-week Air Cavalry Leaders Course to incoming unit commanders in the UAS chain-of-command and staff assigned to units who work directly and indirectly

840 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

with UAS units. The course covers capabilities, concept of employment, limitations, UAS-specific safety, maintenance, standardization, gunnery requirements, and training requirements.

Recap

The Army's UAS training community has operated at Fort Huachuca for over 25 years. It has expanded into new platforms with new capabilities, but its model based on universal enlisted operators trained to operate as an organic divisional asset just prior to deployment has remained. The focus on efficiency has streamlined the training pipeline. Ironically, at the operational level, the Army prizes flexibility over efficiency and possibly effectiveness. Soldiers are trained to fly the Gray Eagle, to operate its payloads, to conduct certain maintenance items, and to handle basing requirements. Comprehensive training enables platoons and companies to operate autonomously, but the decentralized approach prevents specialized focus and high-end capability. It also reduces readiness levels. Low retention plagues the community, but current production meets needed replacement demand.

The underlying focus remains to support and enable the ground forces commander and his mission. The artifacts, values, and assumptions are in accordance with that focus. Such simplicity has led to practical and sustainable decision-making in regards to UAS. The Army will be required to navigate two opposing trends in UAS. One is increased automation, enhancing ease of use. Given the lack of prestige and distinction placed on UAS operators, the UAS community will not resist this advancement. The other trend is future UAS integration further into Army units. This is already raising questions over who flies UAS, where is it organic, who can shoot, and how much money, time, and personnel should be put towards UAS or manned platforms. Currently, UAS is only 5% of Aviation Branch's budget. Aviation Branch funds UAS, but all Army branches want the capability or the promise of capability. Specific demands include cargo, command and control, and Chemical, Biological, Radiological and Nuclear (CBRN) defense. Unless Headquarters Army funds and prioritizes UAS requirements, only Aviation Branch UAS requirements will be funded and developed, leaving gaping holes on the emerging multidomain battlefield.

Chapter 4-
Opportunities Knocking

This is an inflection point… The trend lines are unmistakable that the United States Air Force will be an increasingly unmanned aviation service.

General Norton A. Schwartz, CSAF,
in testimony to the Senate, 21 May 2009.

The RPA's origin has been tumultuous, and its future will remain so. Despite initial capabilities tracing back to World War I, the broad consensus is that unmanned aviation is still in its first generation of development; as General Mark Welsh opined: "Remember we're at the Wright flyer stage, we're just getting started."[1] Future threats and opportunities stand to revolutionize the RPA and bring it rapidly into its next generation. For the near term, technology and societal pressures will force the AF to adapt organizationally and in training more than an adversary will. In adapting, the AF itself will evolve. The impact on the organization is yet to be determined, but technology will undoubtedly leave its mark. As Schein commented, "Ultimately all organizations are sociotechnical systems in which the manner of external adaptation and the solution of internal integration problems are interdependent and intertwined."[2] This chapter transitions away from UAS history and the services' internal responses in forming a training strategy. This chapter looks to the future to identify and explore approaching developments. It addresses three specific developments: increasing automation, the AF introduction of enlisted RPA pilots, and the FAA's push to integrate UAS into the national airspace.

842 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

Development One: Automation

Organizations change cultural assumptions through the subtle, cumulative, and sometimes unintended impacts of new technology….

Edgar Schein, *Organizational Culture and Leadership*

Autonomy will be the driving force behind the development of a new generation of RPAs optimized for more complex air environments, and human distrust in autonomy will lie at the heart of limitations on the design and deployment of these aircraft.

Caitlin H. Lee, "Embracing Autonomy: The Key to Developing a New Generation of Remotely Piloted Aircraft for Operations in Contested Air Environments"

Unmanned aircraft benefited from a confluence of several critical technologies in the early 1990s, such as the Global Positioning System (GPS), advanced microprocessors, and wide-band satellite communication links. In combination, these developments allowed drones to break free from their seemingly perpetual emergent state. Automation in robotics has built upon those technologies to bring widely anticipated capabilities to air power. In 2009, then Chief of Staff General Norton Schwartz commented,

> Industry has already refueled an unmanned aircraft and demonstrated multi-aircraft control-all feats that only a few contemplated 10 years ago. It's not hard to imagine a multitude of other missions for our unmanned aircraft, including air transport, air refueling, suppressing enemy air defenses, forward air control, combat search and rescue, and more. It also is not difficult to imagine new operational concepts, such as groups of unmanned aircraft flying 'swarm' tactics.[3]

Rather than see General Schwartz's comments to fruition, the AF has clung to its UAS construct as seen in Figure 14. It has yet to exploit the promises of automation despite rapidly growing capabilities. Unfortunately, Figure 14 no longer matches external reality. The assumed correlations between capability, complexity, and size have not held. UAS are growing smaller and more capable, while overall complexity for the operator decreases. MQ-9 Reaper aircrews hone their skills to manually track moving

[3] General Norton Schwartz, "Future Of Unmanned Aircraft (Remarks At The Graduation Ceremony For The Unmanned Aircraft System MQ-1 Predator Course, 25 Sep 2009)", (Speech, Creech AFB, NV, 2009).

843 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

vehicles, but off-the-shelf drones can now autonomously track targets using facial recognition. The Global Hawk has the wingspan of a Boeing 737, and high levels of automation through a keyboard and point-click mouse interface make it simple to employ. That ease of operation does not preclude its high capability: its effects are highly prized, and it routinely collects strategic ISR for multiple combatant commanders during a single sortie. All this means the dividing line separating SUAS operators and rated pilots based on aircraft performance has blurred.

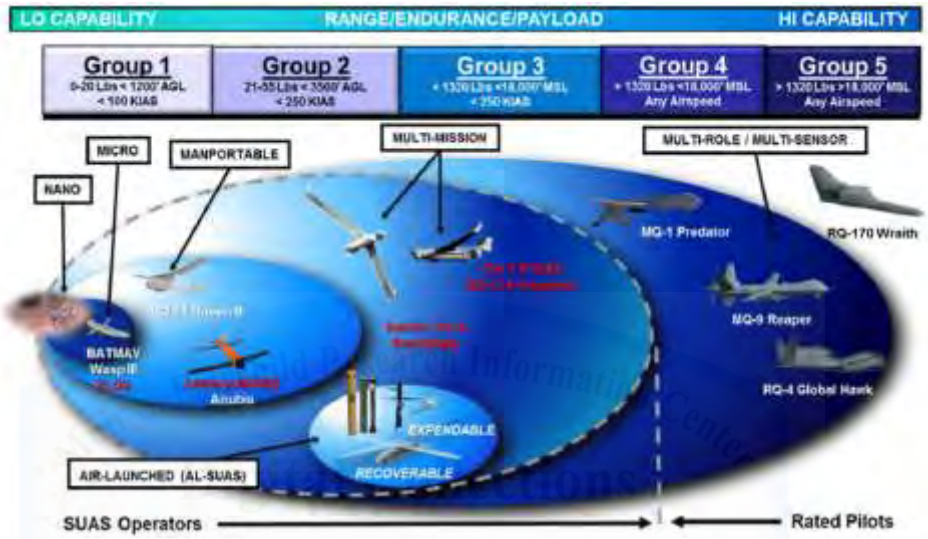

Figure 14: UAS Group Descriptions
Source: Lt Col Jason Green, "A Brief Look: The State Of Remotely Piloted Aircraft (RPA) Operations Local, Global… Past, Present, and Future…", 2016.

State of the art automation now resides in commercial, consumer-level Small UAS (SUAS). Once the realm of tactical employment by well-trained militaries, SUAS now provides tactical, possibly strategic, effects to the untrained and poorly funded. The Islamic State of Iraq and Syria (ISIS) currently employs SUAS as surveillance platforms, grenade launchers, mortar droppers, kamikaze bombers, and flying decoys that hide internal improvised explosive devices (IED). Recently, they have started using multi-ship tactics normally reserved for sophisticated air forces. Christopher Bolkcom, an employee of the US Congressional Research Service, highlighted this possibility in 2002 when he testified before Congress that seven particular features made UAS attractive to terrorist groups. Those seven features are low acquisition costs, ease of purchase, high accuracy, operational flexibility, ability to penetrate air defenses, high prelaunch

844 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

survivability, and little to no infrastructure needed to deploy.[4] He failed to mention ease of use that requires little training. Such characteristics have allowed ISIS to replace expended assets faster than Iraqi forces can target drone factories. Don Rassler of the Combating Terrorism Center at West Point concludes the problem will worsen as capabilities improve:

> Future off-the-shelf drones will be able to carry heavier payloads, fly and loiter longer, venture farther from their controller and be able to do so via more-secure communications links. The increased speed of small drones and advancements in sensors and drone add-on technology (such as infrared and night vision cameras), will compound the problems for counterterror organizations.[5]

The threat has warranted a strategic response from the Department of Defense. Speaking alongside the Secretaries of the Navy and Army at the Center for a New American Security in October 2016, Secretary Deborah James announced the successful takedown of an ISIS drone that had previously killed four civilians. She then commented, "A top priority for me at the moment is this emerging danger that we're seeing in the Middle East in respect to unmanned aerial systems — these cheap, buy-them-over-the- internet, small drones. If explosives are placed on them, as we've seen a handful of times now in Syria and Iraq, they can do damage."[6] Comparatively, the AF has more resources yet has not pursued automation to the degree ISIS has. Several projects described below may change that.

Defense Advanced Research Project Agency's Aircrew Labor In-Cockpit Automation System (ALIAS) functions as a retrofitted vehicle management system in manned aircraft to alleviate pilot workload and crew requirements (see Figure 15). According to Dr. Dan Patt, DARPA's Tactical Technology program manager, ALIAS is a flexible, extensible automation toolkit for existing aircraft that enables safe, reduced

845 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

crew operations. Benefits include enhanced safety in operations, reduced training burden, more capability per dollar via enhanced human effectiveness, and a speeded transition to the next generation of automation and interface.[7] ALIAS highlights automation's scalability well. Rather than distinctly separate manned and unmanned platforms, automation can blend the two. Currently, the Army and SOCOM have agreements in place with DARPA to transition the technology. The Navy and Marines have expressed interest in integrating the capability into existing manned platforms, and DARPA expects commercial participation from Fed Ex in the air proof of concept phase.

Figure 15: ALIAS Inserts New Automation into Existing Aircraft to Enable Operations with Reduced Onboard Crew
Source: "ALIAS – Aurora Flight Sciences", Aurora.Aero, 2017, http://www.aurora.aero/alias/.

The AF stands as the lone service not participating. A retired AF pilot working for DARPA called the AF's lack of involvement in a program with so much potential "mysterious."[8] A ventured guess is culture. Historically, aeronautical engineers balanced flight stability with maneuverability. Maneuverable aircraft demanded skilled, attentive pilots, and therefore flying became prestigious. Technology that reduces the need for skill threatens the prestige given to pilots. Significant gains must offset technology if it reduces the need for skill. Initially, aviators viewed gauges, instruments, and indicators

846 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

of flight parameters as a threat before accepting how much safer they made flight. The F-16 had a Predictive Ground Clearance Avoidance System (PGCAS) for years that would notify the pilot of an impending crash into terrain, but it would not recover the aircraft automatically. The system needed a conscious pilot to recover the aircraft. In testing an Auto-GCAS, the overriding concern was uncommanded, undesired aircraft inputs.[9] Various levels of automatic recovery systems existed for three decades before the AF introduced Auto-GCAS in 2014.[10] Since its introduction, the automated system has saved four incapacitated pilots. Dr. Patt recognized that the AF loves technology but views it as a tool to aid human judgment not to replace it. He marketed ALIAS differently to each service. To the Army and Marine Corps, he emphasized the flexibility of ALIAS, how it provides staffing options based on mission requirements, threat levels, or costs. Leaders may identify a complex mission and elect two pilots to fly the aircraft, or they may elect to unman the aircraft for sorties in high-risk environments. To the AF, he emphasized that ALIAS augmented the pilot by offloading routine tasks. Patt envisions that, during critical phases of flight or emergencies, ALIAS can deliver timely information, warnings, and assistance to the pilot. He left out the obvious logical conclusion that, if successful, his program could unman the entire AF fleet.

The Army is working on developing the equivalent of a universal remote for its unmanned aerial systems. The capability allows training to be reduced, and for a universal operator to control multiple, different UAS without additional training.[11] The Scalable Control Interface (SCI) will combine the interfaces for Gray Eagle, Shadow UAS, and other small UAS into the system. If the program remains on schedule, the Army will field SCI by 2020. In the meantime, the Army's UAS Capabilities Manager staff is reevaluating mission management functions, redefining current UAS control terminology, and introducing new terminology to describe the control inner-relationships SCI will enable. Major Ariel Schuetz, the Army's Training and Doctrine Command UAS

Capabilities Management operations officer, presented five different levels of operator authority and capability similar to computer software user permissions. A mission manager will serve the role of administrator where he will task aircraft, send mission plans, and assign aircraft to other managers, controllers, and users. Similar to a computer network administrator, the SCI manager will approve or deny requests from other users. Control that the manager can grant includes exclusive control, supervised usage, and unsupervised usage based on user qualification, need, situation, and command guidance. While SCI is in development, the Army is testing its techniques, tactics, and procedures via its current Manned-Unmanned Teaming (MUM-T) capability.

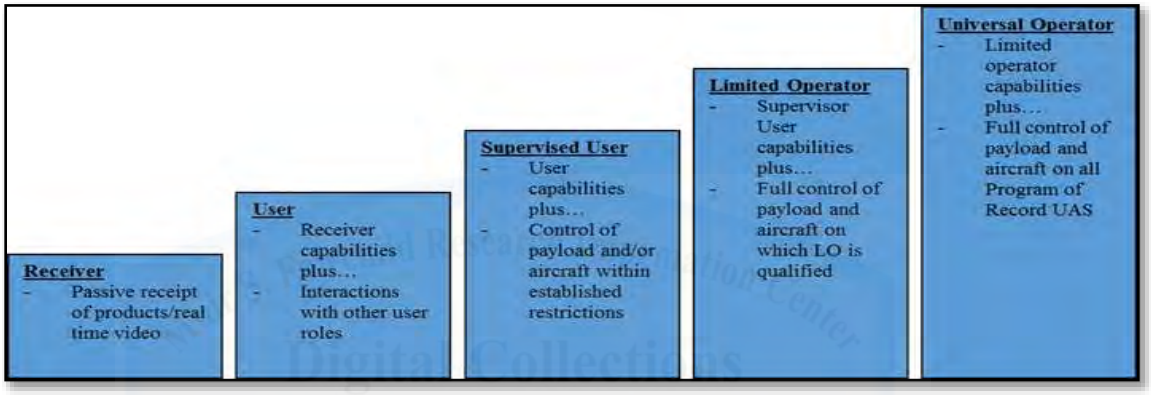

Figure 16: Army UAS Operator Terminology
Source: Army TRADOC UAS Capabilities Manager, Scalable Control Interface (SCI) Definitions, 2016.

In 2015, DARPA successfully demonstrated its Persistent Close Air Support (PCAS) concept. The program gives Joint Terminal Attack Controllers (JTACs) the ability to visualize, select, and employ munitions at the time of their choosing from optionally manned/unmanned aerial attack platforms. PCAS transfers decision making from the pilot to the JTAC via a weapon-carrying "smart rail" and an Android-based tablet.[12] Easily applicable to RPA, PCAS offers weapons solutions and delivery profiles as well as the ability to move weapons release closer to the release authority. An RPA Weapons Instructor Course (WIC) graduate commented that he did not see the utility of such a capability and reiterated that weapons release authority should reside with the

[12] Marshall Frith (DARPA PCAS Systems Engineering and Technical Assistance Manager), interview by author, 28 December 2016.

848 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

pilot.[13] In line with that thinking, the AF's Air Combat Command and Special Operations Command do not plan to leverage the capability. Meanwhile, the Marine Corps and ARSOAC's 160th Special Operations Aviation Regiment are actively transitioning the concept to an operational capability.

Congress's 2017 National Defense Authorization Act funded $15 million toward integrating an automated takeoff and landing capability on the MQ-9.[14] The Army's MQ-1C Grey Eagle has had this feature since its acquisition, and the AF will "look to the army, who figured it out with the same manufacturer."[15] This overdue development brings two significant advantages to the MQ-9. First, it will ease training requirements. Currently, launch and recovery training takes 32 training days and costs approximately $99,000 per pilot.[16] The indirect cost is the pilot's time away from the operational mission. While pilots train in launch and recovery, squadrons conducting real world remote-split operations pay the manning bill. The just-in-time training model puts undue stress on the squadrons and is inefficient. The Culture and Process Improvement Program, as discussed in Chapter 3, will change this model to a dedicated, deployable launch and recovery squadron.

Second, auto takeoff and land functionality increases operational flexibility. Divert airfields, if required, would not require on station recovery crews--just the guidance system. In addition, according to General Atomics, the capability needs less runway length due to better landing precision.[17] Launching and recovering aircraft with automation eliminates the need to use a line of sight frequency. In turn, this reduces congestion and interference in the electromagnetic spectrum.

A third additional but uncertain impact of automated operations is reducing the deployed RPA footprint. The Global Hawk has automated takeoff and landing capability

[15] James Drew, "USAF To Automate MQ-9 Takeoffs And Landings", Flight Global, 2016, https://www.flightglobal.com/news/articles/usaf-to-automate-mq-9-takeoffs-and-landings-424975/.

[16] ACC does not track the cost of Initial Qualification Training, Flight Instructor Upgrade Training, or Launch and Recovery Training. Costs are estimated assuming $4,762 per MQ-9 flight hour, taken from Mark Thompson, "Costly Flight Hours", *TIME.Com*, 2017, http://nation.time.com/2013/04/02/costly-flight-hours/. Instruction is calculated at $33/hour of instruction, equivalent to Army UAS cost.

[17] Drew, 2016.

849 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

as mentioned earlier. The community still deploys crews to monitor landings, but in much smaller numbers. At a collocated downrange location, MQ-1 Predator operations require eight aircrew, and Global Hawk operations require three for similar launch and recovery demands. When properly equipped, MQ-9 Reaper operations will drawdown to mirror Global Hawk operations, but the primary benefits of automated takeoff and land capability will lie primarily in a reduced training bill and increased operational flexibility.

Autonomy is not binary; it scales. "Autonomy is an 'adjustable' concept that one can employ to varying degrees, depending upon the role of an aircraft and its mission—a critical point because of the tendency to view autonomy as an all-or-nothing proposition."[18] The AF struggle to embrace autonomy demonstrates one cultural value trumping another; the value placed in the operator and maximizing platform performance through training that operator is taking precedence over the service's trust in technology. At present, technologies are adopted as long as they do not undermine the operator's importance. Emerging advancements that allow the operator to scale automation may ease this cultural transition toward more technologically determined values.

US adversaries like ISIS are embracing autonomy to overcome scarce resources, expertise, and training. Likewise, autonomy will force the AF to adapt or risk irrelevancy. As highlighted, multiple autonomous capabilities are presently possible or on the horizon, and they will affect RPA operations and therefore training. The AF has integrated many systems at automation level 7 through 10 (see Figure 17). Traditionally, the service scrutinized and debated systems above that level like the F-16's Automatic Ground Collision Avoidance System before implementation in an attempt to preserve as much flexibility and capability to the pilot as possible. Now, though, automation increases flexibility and capability. Scaling automation rather than toggling it on or off is the final step to build operator trust and ease the AF's cultural transition.

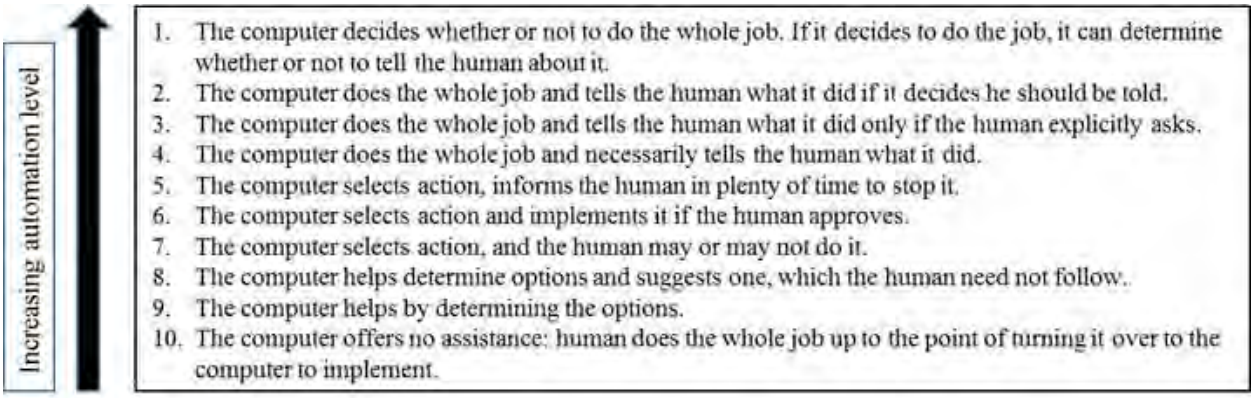

Figure 17: Automation Levels in Man-Computer Decision Making
Source: Caitlin H Lee, "Embracing Autonomy: The Key To Developing A New Generation Of Remotely Piloted Aircraft For Operations In Contested Air Environments", Air & Space Power Journal 25: 76-88.

Development Two: EPIC

On December 17, 2015, Secretary of Air Force James directed the integration of enlisted pilots into the RQ-4 Global Hawk community. This civilian mandate was a long time coming; in 2003, the Senate Armed Services Committee tasked the Air Force to "create a cadre of warrants to serve as pilots for unmanned aerial vehicles."[19] Twelve years later, James tasked ACC and AETC to develop an implementation plan to provide an additional avenue for capability growth.[20] In the fall of 2016, the AF implemented the Enlisted Pilot Initial Cadre (EPIC) program. The inaugural class of four candidates entered RPA Initial Flight Training in October 2016. One withdrew, and the three remaining transitioned to the RPA Instrument Qualification course and RPA Fundamentals Course to graduate successfully in the spring of 2017. The 558 FTS will produce 12 enlisted pilots in 2017. The AF selected EPIC candidates from enlisted aircrew career fields. As the AF transitions to full production, Air Force Personnel Center plans to accept NCO and SNCO applicants from any career field. Pilot officer candidates take an Officer Qualifying Test before entry to training; the AF will judge future enlisted applicants' aptitude based on their OQT score as well. In the EPIC program, an aptitude test has not been required, possibly due to oversight. AETC leaders did not make any URT syllabus changes to accommodate EPIC and, purposely, they did

[19] Colonel Timothy Schultz, UAS Manpower Exploiting A New Paradigm (Maxwell AFB: Air Force Research Institute, 2009), 38.
[20] Secretary of Air Force Deborah James, memorandum for record, 17 December 2015.

851 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

not name the program a test, trial, or beta case. Lt Gen Darryl Roberson, AETC/CC, summed up the plan: "Right now, the going-in plan is that the training we give to the enlisted pilots is going to be exactly the same as what we're giving our officer pilots. So right now there is no difference. We did that very deliberately."[21]

Unfortunately, the EPIC program does not expand the training pipeline, the community's bottleneck, and therefore does not alleviate manning troubles. General Roberson was clear on that point as well: "The way that we're approaching this is each enlisted pilot that comes in is going to replace what would have been an officer. So it's not additive, it's a replacement for."[22] The Air Force Personnel Center calculates that it needs 100 total enlisted graduates in the next few years to pilot 70% of Global Hawk missions. In the 2017 National Defense Authorization Act, Congress increased the mandate to enlisted pilots flying the preponderance of Global Hawk missions by September 30, 2020. The NDAA declared, "The Secretary of the Air Force shall transition the Air Force to an organizational model for all Air Force remotely piloted aircraft that uses a significant number of enlisted personnel as operators of such aircraft rather than officers only."[23] The directive states that, if any enlisted pilots operate an RPA, then the AF needs to adopt an enlisted force model. The wording incentivizes the AF to prohibit enlisted pilots from flying the MQ-9 lest it transition to an enlisted-dominated career field.

The Active Duty Service Commitment for URT is 6 years. Assuming timely pipeline production, enlisted pilots will serve 5 years. If they perform commensurate to their officer counterparts during their first tour, the opportunity may open to transition enlisted RPA pilots to MQ-9 slots. Without an overriding reason to prohibit such a move, inertia will push enlisted RPA pilots to more platforms. Whether for enlisted or officer pilots, the current RTU curriculum is identical. If both groups graduate with the same qualifications, officers become financially unjustifiable. The Army's model then is

[21] Phillip Swarts, "Enlisted RPA Training To Begin In October, Head Of AETC Says", Air Force Times, 2016, https://www.airforcetimes.com/articles/enlisted-rpa-training-to-begin-in-october-head-of-aetc-says.

852 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

a proven way to incorporate an enlisted/officer force. Officer expectations and therefore training will need modification.

The AF reintroduced enlisted pilots under a different context and with a different goal than their World War I or World War II brethren. Enlisted pilots served proudly and effectively in the Army Air Corps first during a time of light supervision and then during a frantic buildup leading to war. At the conclusion of World War I and World War II, rapid force reductions coupled with pilot commissioning programs meant the enlisted pilot legacy was short-lived.[24] Public justification for today's move by senior AF leaders has focused on enlisted talent. This strikes the author as disingenuous and confuses the narrative. Introducing an enlisted RPA pilot cadre signals a desire to reduce personnel costs and recognizes that RPAs require less skill to operate. Today's enlisted RPA pilot is not serving in a transitory position or as an expedient.

Development Three: FAA's National Airspace Integration of UAS

Difficulty integrating UAS into the national and international airspace slows large UAS growth in the civilian industry and the production of new unmanned aircraft types with expanded missions. Michael Huerta, the Administrator of the FAA, published a UAS integration roadmap in 2013 and commented on the hurdles integration faces,

> In moving forward, we recognize that the expanded use of unmanned aircraft presents great opportunities, but it's also true that integrating these aircraft presents significant challenges. There are operational issues that we need to address, such as pilot training. We also need to make sure that unmanned aircraft sense and avoid other aircraft, and that they operate safely if they lose the link to their pilot.[25]

Safety for the FAA is an overriding priority, and several UAS characteristics currently restrict integration. As highlighted in its roadmap:

[24] Lee Arbon, *They Also Flew: The Enlisted Pilot Legacy, 1912-1942* (Washington: Smithsonian Institution Scholarly Press, 1998), 45.

853 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

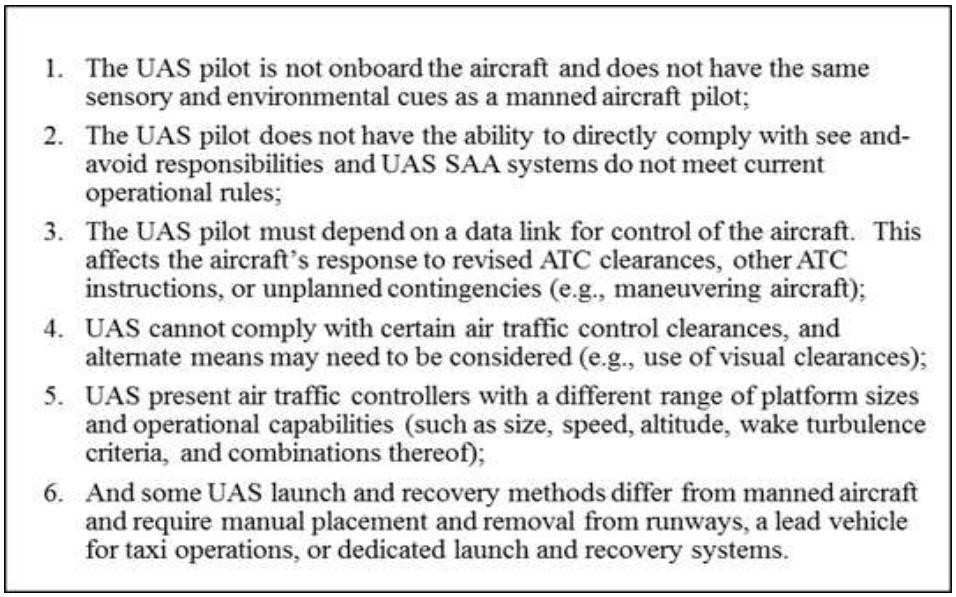

Figure 18: FAA UAS Integration Hurdles
Source: Federal Aviation Administration,. Integration of Civil Unmanned Aircraft Systems (UAS) In the National Airspace System (NAS) Roadmap. FAA, 2013. https://www.faa.gov/uas/media/uas_roadmap_2013.pdf, 18-9.

The six integration hurdles revolve around collision avoidance and control. Automating collision avoidance and ensuring aircraft control remotely present technological challenges. "Sense and avoid" capabilities must provide for self-separation and ultimately for collision avoidance protection between UAS and other aircraft analogous to the "see and avoid" operation of manned aircraft. The FAA judges "sense and avoid" technology as immature and far from an acceptable level of safety.[26] Additionally, airspace integration requires reliable control and communications systems. The FAA is crowd sourcing consensus-based recommendations from industry and safety organizations to shape its policy, program, and regulatory decisions. The resulting requirements need to support the minimum performance required to achieve higher-level (UAS level) performance and safety requirements.

The FAA's integration plan has three phases: special access, routine access, and normal access. Currently, UAS transit the national airspace predominately through special access channels that grant specific certificates of authorization (COA). The FAA levies numerous and varied operational restrictions in its COAs based on the

[26] Federal Aviation Administration, *Integration of Civil Unmanned Aircraft Systems (UAS) In the National Airspace System (NAS) Roadmap* (FAA, 2013), https://www.faa.gov/uas/media/uas_roadmap_2013.pdf, 19.

854 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

airspace environment, UAS performance, and operator training. Neither the FAA nor DoD are satisfied with the inflexible system, but a shift toward more integration is conditions-based to ensure safety. In its mid-term phase of routine access, the FAA plans to shift to non-segregated access as policy, procedures, and technology permit. Emerging Ground Based Sense and Avoid (GBSAA) capabilities allows that routine access in localized operational areas, but its infrastructure does not permit flexibility or easy expansion. The final phase is normalized access. Developments that produce a robust Airborne Sense and Avoid (ABSAA) assurance will finally allow UAS to operate in the NAS with an equivalent level of safety and efficiency as manned aircraft. Promising technologies include electro-optic, infrared, and radar sensors, Automatic Dependent Surveillance-Broadcast, and Traffic Alert and Collision Avoidance System.[27] The FAA wants to transition from accommodating UAS via COAs to full integration, but policy waits for technology to create suitably safe conditions.

Clear solutions are not obvious for UAS airspace integration, but pressure from influential businesses like Amazon and FedEx, Department of Defense, Department of Homeland Security, and civilian customers make integration inevitable. Once that barrier falls, AF use of RPAs will proliferate to other missions like cargo transport and air refueling, and training requirements will morph further to accommodate required skills. RPA training focuses heavily on ISR and weapons employment even in URT. New aircraft types that perform different missions will necessitate new training objectives. Furthermore, an integrated airspace will explode demand in civilian industries. Civilian companies will target AF RPA pilots' expertise and provide financial incentives for RPA pilots to leave the service. The AF will have to react; its difficult job will be to manage experience levels, forecast trends, and train efficiently.

The AF pushes the FAA for increased UAS integration for practical reasons. COA negotiations are lengthy and produce inflexible and inconvenient operating conditions. As integration moves forward, the RPA community's assumptions about internal integration will change. An observer sees organizational culture in group boundaries and identification. Right now, large UAS are exclusively military and

[27] FAA Roadmap, 29.

855 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

predominately weaponized. Not having civilian functionality has led bystanders to view UAS as war mongering, faceless machines. Integration will lead to proliferation and, in turn, familiarity lessening the stigma.

Recap

Cumulative developments like automation, societal shaping as seen in EPIC, and sequential efforts like the FAA's integration plan will thrust UAS into its second generation. Whether perceived as opportunities or threats depend on perspective. The AF's large budget, advanced military industrial complex, and highly trained and experienced personnel create many competitive advantages that are well suited to leverage automation, an enlisted force, and airspace integration. The advancements highlighted have technological roots, but it brings several deep cultural assumptions into conflict. They each increase air power's reach, flexibility, and affordability, but they threaten the skill required by an aviator. Carl Builder observed that, "when other means such as unmanned aircraft… became available, it was the aviators who revealed, by deeds more than words, that their real affection was for their airplanes and not for the concept of air power."[28] This runs counter to military professionalism and American expectations. The US calls on the AF to provide lethal air power as an instrument of national power, but the cornerstone has been the pilot. As that changes, how the AF defines reality, time, and space will expand, and leadership, vision, and a good strategy will be key to the AF successfully navigating the sociotechnical waters ahead. The next chapter dissects the AF's current RPA training strategy in contrast to the Army's. Service strengths and weaknesses implied in chapters one through three by way of comparison and the emerging opportunities discussed here will merge in a Strength, Weakness, Opportunity, and Threat (SWOT) analysis.

Chapter 5
Strategy Analysis: AF RPA Training

The AF needs to reevaluate its current RPA pilot training strategy to prepare for future threats and opportunities. The AF reduced its ISR commitment from 65 combat lines down to 60 while combatant commanders increased their demand to 90. As Chapter 3 highlighted, the AF has been unable to scale production in a timely manner to meet increasing demand, and changing context will exacerbate the problem. In response, the Army has allocated more UAS resources to fill the gap. In essence, the AF has lost market share in an operating environment in which it clearly should be dominant. Debatably, the AF may recover with its current training strategy in the near term, but future opportunities and threats will require new approaches.

The first three chapters established a pattern of the external environment changing and the AF or Army subsequently adapting to meet needs. In the process, each service solved internal integration issues. The benefit of understanding each service's UAS origin and ensuing culture is an increased ability to identify organizational strengths and weaknesses. The last chapter forecasted three emerging developments that stand to reshape the UAS community. The first section of this chapter presents a method to analyze, classify, and test strategies. The second section dissects the AF's current RPA training strategy in the context of its broader Strategic Master Plan as well as in comparison to Army UAS training using a Strength, Weakness, Opportunity, and Threat analysis. The analysis concludes that emerging trends threaten to render the current strategy obsolete. Chapter 6 builds on that conclusion by analyzing two possible courses of action.

Methodology

This chapter conducts a Strength, Weakness, Opportunity, and Threat (SWOT) analysis for the AF's current training strategy. As implied in its name, a SWOT analysis is an analytical tool for understanding internal strengths and weaknesses and for identifying external opportunities and threats. Typically used in a business setting, SWOT analysis is useful in many decision-making situations to create a recommendation.

857 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

Strengths and weaknesses include human resources, physical resources, financial situation, activities and processes, past experiences, and organizational culture. Opportunities and threats stem from external forces and include future trends, the local, national, or international economy, funding sources, demographics, the physical environment, legislation, and local, national, or international events.

Michael Porter, an influential business professor at Harvard Business School, posits that an organization in a competitive landscape has three generic strategies available to pursue. The first is a Low Cost Leadership strategy. There are three main ways to achieve cost leadership. The first approach is achieving high utilization rates. In a training environment, this means maximizing the use of resources like simulators, aircraft, classrooms, and instructors. Spreading fixed overhead costs over a larger number of graduates results in a lower unit cost. Runways, air traffic control towers, base hospitals, and aircraft are examples of overhead. The second dimension is achieving low direct and indirect operating costs. Standardizing a basic product keeps costs low by using fewer parts and using standard components. Low wages, low rent areas, and establishing a cost-conscious culture contribute to lower overhead costs. Cost reduction avenues include outsourcing, controlling production costs, and minimizing other costs like research and development. The initiative to reduce unnecessary weight like heavy paper publications or extra fuel on C-17 flights is an example of reducing direct operating costs. Another is not teaching multiple mission sets in a training course to reduce time and operating expense. The third dimension is control over the value chain to ensure low costs. For a supply chain, this could be achieved by buying in bulk, instituting competitive bidding for contracts, or working with vendors to keep inventories low.

Mass production becomes both a strategy and an end in itself. This can be an advantage: higher levels of output both require and result in higher market share. In turn, the firm's low costs and efficiencies create an entry barrier to potential competitors who are unable to achieve similar economies of scale. Disadvantages include lower loyalty from price-sensitive customers and a reputation for low quality. Another risk is that cost reduction is not unique, and competitors may copy your cost reduction strategies. Combatting this requires continuous improvement by investing in technologies aimed at reducing costs, maintaining efficient logistics, and keeping labor, material, and facility

858 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

costs low. The desired result in a Low Cost Leadership strategy is, given a constant budget, to produce more through cost reduction.

Differentiation, the second strategy, involves making your products or services different from and more attractive than those of your competitors. Uniqueness in features, functionality, durability, support, or image characterizes valued, differentiated products. Providing contrasting products or services is a successful strategy when the target customer is not price-sensitive, customers have specific and under-served needs, and the company has unique resources and capabilities. A differentiation strategy is successful not by increasing market share but by achieving brand loyalty or a price premium. Organizations see gains when a price premium outweighs the added cost of specialization. Conversely, differentiation is a poor strategy if competitors can easily copy the product, method, or service provided. As an example, the C-17's capability to land on unimproved strips does not appeal to the airline industry, the dominate aircraft purchaser, but it did appeal to air forces around the world. To execute a differentiation strategy successfully, organizations need: good research, development and innovation; the ability to deliver high-quality products or services; and effective marketing to communicate the benefits offered by the differentiated offerings.

A Focus strategy, the third option, divides the existing market and then adopts a Differentiation or Low Cost Leadership strategy to serve that niche market. By understanding the dynamics of that market and the unique needs of customers within it, smaller companies then develop uniquely low-cost or well-specified products to outcompete broader market strategies. The firm typically looks to gain a competitive advantage through product innovation or brand marketing rather than efficiency. By serving customers in a unique market well, a small company's advantages include strong brand loyalty and less competition. The barrier to entry for competitors is deep, local knowledge. Disadvantages include difficulty expanding to dissimilar markets.

AF Strategic Master Plan

In 2015, the AF released its 20-year Strategic Master Plan (SMP) to lay out five strategic vectors that identified priority areas for investment, institutional change, and operational concepts. The aim is to provide coherency and a unified direction across the

859 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

AF. One can also sift through the SMP to see how the AF answers fundamental questions about the service it provides and how it sees the future of armed conflict. Of the five strategic vectors, two in particular pertain to current RPA operations. The second strategic vector charges the AF to maintain a robust and flexible global ISR capability.[1] To accomplish this, Headquarters Air Force champions a "rebalance [of] resilient ISR sensors, systems, and processes toward operations in high-end contested environments," and advocates increased capabilities "against critical target sets in highly contested environments."[2] The third strategic vector complements the second: "Ensure a full-spectrum capable, high-end focused force."[3] The consequences of not achieving freedom of maneuver are dire: "Without high-end air, space, and cyberspace capabilities, these denied regions will pose significant, if not insurmountable, obstacles to friendly forces. Our greatest value to the joint force is dealing with these advanced threats…."[4] AF strategists, in crafting the SMP, used "high-end" 18 times and "deterrence" 22 times in 65 pages. The AF is positioning itself to win, or at least deter, in a Cold War II. As acquisitions and missions develop to counter near peer nation states, training will need to adjust.

Figure 19: Platforms Tailored to Future Conflicts as Described in the Strategic Master Plan
Source: Author's original work

Clearly, the AF wants to refocus on the high-end spectrum of conflict where its role is more deterrence than brute force. This contrasts with the modern security environment and where the bulk of RPA training and assets are focused. RPAs matured during low intensity conflicts, and RPA platforms reflect that beginning. They operate in permissive environments and are primarily intelligence-gathering assets. Several noted security experts in academia disagree with the AF's prognosis on future conflicts. Mary Kaldor in *New and Old Wars* posits that, in the context of globalization, war between states in which the aim is to inflict maximum violence is becoming an anachronism. Present-day actors transcend previous geographic and political boundaries. The wars are fought for political goals using tactics of terror and destabilization that do not abide by the rules of modern warfare, and top down approaches to resolve issues favored by strong nation states are likely to fail. "Since the new wars are, in a sense, a mixture of war, crime, and human rights violations, so the agents of cosmopolitan law-enforcement have to be a mixture of soldiers and police."[5]

David Kilcullen in *Out of the Mountains*, identifies population growth, urbanization, littoralization, and networked connectivity as four emerging megatrends and correspondingly suggests that conflict is increasingly likely to occur in coastal cities,

[5] Mary Kaldor, New and Old Wars, 1st ed. (Cambridge: Polity Press, 2012), 12.

861 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

in underdeveloped regions, and in highly networked, connected settings.[6] The answer is "co-designing" a response to improve resilience. Outsiders bring training, mentoring, technical skill, functional knowledge, research, support, and technical assistance, and locals bring insight, hyperlocal context, spatial understanding of systems logic, day-to-day flow, and ultimate action to implement the program.[7] In this new security environment, "the paradox is that although there are no purely military solutions, there are also no solutions without the ultimate sanction of coercion to enforce the order that makes joint action possible."[8]

Finally, Emile Simpson's central proposition in *War from the Ground Up* is that the traditional model of war as a bipolar conflict between two discrete political units is no longer helpful to understand or exploit the modern battlefield. Whereas nation-states fought past wars to achieve a military end state, soldiers today conduct armed action to directly seek political outcomes. Military leaders now must consider the impact of their actions not only on the enemy but also on a diverse set of audiences.[9]

Since its origin, the USAF has historically had difficulty transitioning its focus away from near peer adversaries to the low intensity conflicts in which it frequently finds itself. If academics are right, the AF's current strategic preparations for great power war may be setting the service up for future identity problems and a capabilities mismatch similar to Operations Iraqi Freedom and Enduring Freedom. Positioning training well to accommodate high-end capabilities and low-end conflicts may be problematic.

Comparison Difficulties

Several factors make direct comparisons between Army and AF RPA training difficult. Cost differentiation is one. Army accounting includes fixed overhead costs and variable direct costs like student pay, lodging, and travel. Because the Army relies on remote split operations less than the AF, UAS operators deploy more frequently and for

[6] David Kilcullen, Out Of the Mountains: The Coming Age of the Urban Guerrilla, 1st ed. (Oxford: Oxford University Press, 2013).

862 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

longer periods than do their RPA counterparts. Combat zone pay and tax relief programs bolster their take home pay. Furthermore, the Army Military Occupational Specialty (MOS) code for UAS is currently 15W regardless of UAS type. Data tracking UAS operators does not distinguish between Gray Eagle or Shadow operators. Finally, distilling the cost of just flight training to compare costs is subjective. The Army trains each operator to fly the aircraft and operate its sensor suites rather than specializing each task the way the AF does.

Compounding difficulties in comparison, many factors make AF costs unpredictable. For instance, at the FTU, temporary duty (TDY) costs amount to $100 per student per day. Additional training time due to poor weather or lack of instructor availability means additional TDY lodging and per diem costs. In 2016, FTU classes graduated on average 25 days late. This added up to $2.7 million in additional TDY costs.[10] It does not help that no AF staff is tracking RPA operating, training, or personnel costs to a high fidelity. Amazingly, ACC does not know exactly how much the MQ-9 FTU or Launch and Recovery course costs.[11]

Another cost variable difficult to track is AF personnel costs. They vary wildly, and a complete lifetime cost analysis is elusive due to multiple variables tracked across multiple staffs. Different personnel costs start with officer commissioning sources and AF education assistance. An Air Force Academy education costs $322,750 per graduate, whereas the AF often does not incur any undergraduate education cost for Officer Training School accessions.[12] Both commissioning sources feed officers to URT. In addition, Aviation Retention Pay packages offered by the AF vary each year, and an individual's aviation experience determines his Aviation Career Incentive Pay (ACIP). The recent ARP package for 2017 is $35k/year for 5 years return of service but previous years were $25k/year with a 20-year aviation service option.[13] The program's take rate

863 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

varies each year as well. Another variable difficult to account for is supplemental income like Base Allowance for Housing (BAH). DoD determines BAH by location costs and scale the allowance proportionally to rank. An O-5 with dependents stationed at Creech AFB receives $2022 per month for housing, while an E-3 without dependents at Ft Huachuca is entitled to $624.[14] Personnel become more expensive as their Total Active Rated Service (TARS) increase. AF members have longer service commitments, and a greater percentage of rated personnel retire than do Army UAS operators. Finally, AF staff billets require more qualified field grade officers costing more than similar Army positions.

Comparison of Current AF and Army Training Pipelines

This section employs considered judgement to compare AF RPA training and Army UAS training based on time, qualifications, personnel, and cost. Previous sections and chapters have alluded to these differences; this section discusses and presents the comparisons using quick-reference visuals. It then transitions to a SWOT analysis based on the AF's current strategy of Focused, Differentiation compared to the Army's Low Cost Leadership strategy. The comparison includes the AF's RPA training including URT and the MQ-9 RTU but not Launch and Recovery training that many RPA pilots never attend. Army's UAS training includes the Common Core course and Gray Eagle qualification course. Several quick-reference figures and tables are included.

Figure 20 displays a comparative training timeline for each service. URT and the FTU take 40 weeks combined. This does not include frequent delays or any holding time between courses. Conversely, the 15W training pipeline is considered Advanced Individual Training (AIT), and graduation dates are non-negotiable. Infrequently, students who are unable to complete the syllabus due to poor weather or other extenuating circumstances still depart to their gaining unit on time.

[14] "BAH Calculator", Defensetravel.Dod.Mil, 2017, http://www.defensetravel.dod.mil/site/bahCalc.cfm.

864 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

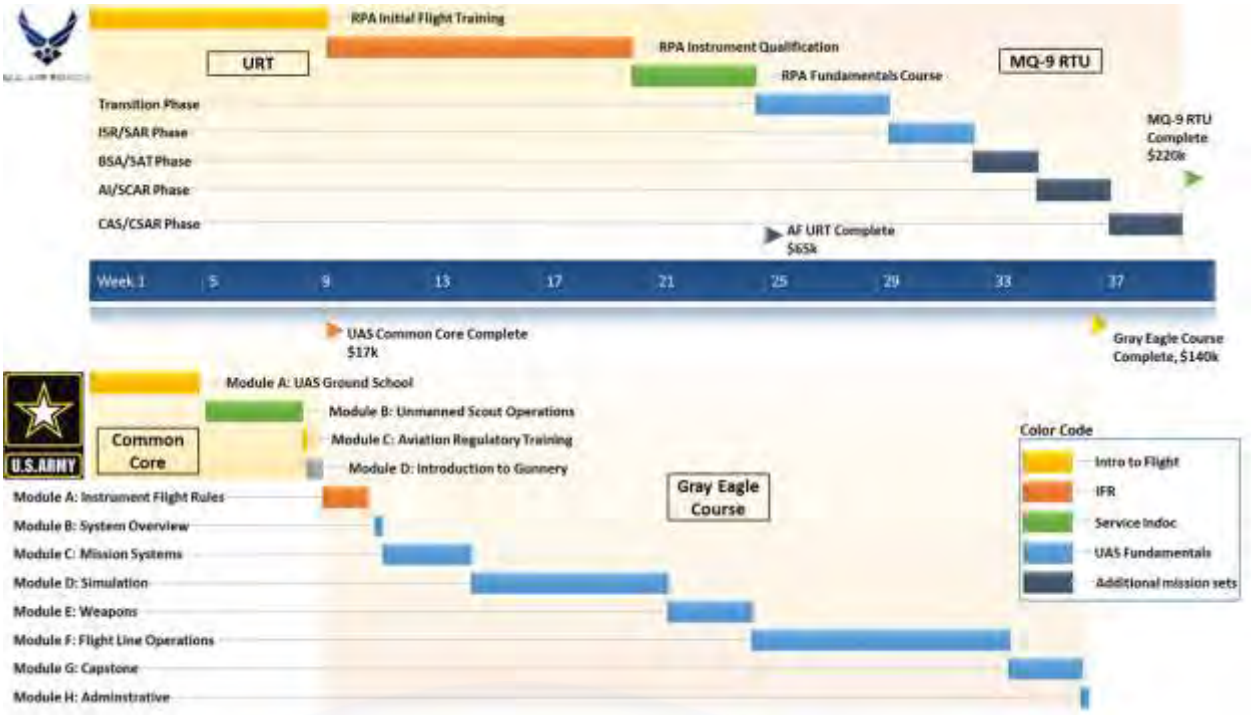

Figure 20: USAF RPA Training Pipeline Compared to USA UAS Training Pipeline
Source: Author's original work

At first glance, the training timelines appear similar, but the final products are significantly different. Gray Eagle training includes airfield operations, deployed setup and disassembly, and launch and recovery operations. The AF's launch and recovery (LR) course covers comparable material, but only deploying crews receive the just-in-time training. The course is 19 to 32 training days and costs approximately $99k. Some squadrons utilize contractors downrange for launch and recovery; those squadrons rarely send any pilots to LR training. The final five weeks of MQ-9 training is devoted to advanced mission sets like Surface Attack Tactics, Air Interdiction, Strike Coordination and Reconnaissance (SCAR), Close Air Support, and Combat Search and Rescue. The Gray Eagle course introduces basic gunnery and then allows follow on units to tailor further training to its particular mission.

Despite the comparison difficulties as explained earlier, personnel and training costs are a significant point of contention and deserve analysis. The following analysis focused on personnel costs irrespective of BAH costs, hazardous duty pay, tax-free deployments, or pensions in order to simplify the comparison. Flight pay and bonuses are included. The AF has roughly 915 RPA pilots. When extrapolated from AF-wide

865 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

statistics, the estimated rank distribution for RPA pilots is: 125 O-1s, 129 O-2s, 398 O-3s, 242 O-4s, 180 O-5s, and 62 O-6s.[15] This averages to a yearly salary, including ACIP and a 55% bonus take of $35k/year, of $95k. The bonus take rate reflects the AF historical average. Adding retirement costs using the Top 3 Retirement plan adds approximately another $110k/year of service to O-5 and O-6 retirees.

The Army has 2370 total 15W personnel.[16] The current breakdown is 577 E3s, 719 E4s, 527 E5s, 348 E6s, and 199 E7s. These numbers include Gray Eagle and Shadow UAS operators that function as both pilots and sensor operators. This averages to a yearly salary of $36k. 15Ws do not receive ACIP, but the Army offers retention packages from $11k to $45k as needed. Table 1 lays out the course hours and costs for each segment of training. Total cost for URT and the MQ-9 RTU is $285k, and the cost for the Common Core and Gray Eagle courses is $157k.

Table 1: RPA/UAS Hours and Cost Breakdown Per Student

Current AF Strategy: Focused Differentiation

RPA employment has focused on low intensity conflicts. Its role, partly dictated by aircraft and architecture design and partly mandated by the character of recent conflicts, has been primarily persistent attack. Training has followed suit. Determining and understanding the AF's RPA training strategy depends on who is considered the end user. If viewed as serving "organize, train, and equip" major commands such as Air Combat Command, RPA training focuses on the low intensity conflict/persistent attack niche market as a low cost leader in comparison to other Combat Air Force (CAF) platforms. In this regard, RPA training strategy has mirrored the AF's RPA employment strategy of low cost. Compared to the fighter/bomber community, the RPA community downplays differentiation possibilities and trumpets its Low Cost Leadership in combat employment. The MQ-9 costs $4,762 per hour, the F-22 costs $68,362 per hour, and the B-1 costs $57,807 per hour.[17] The training arena is similar: the schoolhouses instruct a specific mission set, ISR and persistent attack, much more affordably than do other similarly capable platforms. MQ-9 Initial Qualification Training is estimated at $220k per student, and the F-16 RTU costs $2.7 million.[18]

Changing the targeted consumer to the combatant commander reveals a slightly different training and employment strategy. Selecting the combatant commander as the customer prioritizes the warfighter's needs and ultimately the defense of national interests over internal organizational needs. The combatant commander advertises his request for forces in terms of specific capabilities needed. To fulfill those needs, the AF has chosen a relative strategy of Focused, Differentiation. In comparison to the Army, AF RPAs deliver more employment flexibility and mission sets beyond ISR. Employment, manning, and training are relatively more costly, but the premium price brings with it higher end kinetic capability like interdiction, close air support, and search and rescue. The AF's reluctance to lower training standards or decrease the number of mission sets instructed in order to graduate more students to meet rising demand demonstrates its adherence to a Focused, Differentiation strategy. Whether the strategy is

867 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

successful or not depends on the combatant commander's ability to discern between similar platforms' performance and the demand for one product over another.

A Focused, Differentiation training strategy has several strengths and weaknesses when compared to the Army's Focused, Low Cost Leadership strategy. RPA training enables a unique capability that other AF platforms cannot match: unparalleled loiter with on-call strike. Its limited multi-role capability provides more options than Army UAS. Moreover, as the RPA community has adopted the wider AF's model of organizing, training, and equipping, it has integrated into the AF culture. Benefits of that include empowered, capable personnel with opportunities for promotion and community advocacy.

Two significant weaknesses exist with the current strategy. One is that lengthy training creates an obstacle to upscale production quickly. Efforts to expand the training pipeline started in 2014, and significant progress has yet to be realized. Second, and most important, the value of training differentiation is in doubt. The vast majority of RPA tasking involves lengthy transiting and ISR. Additional mission sets are required much less frequently. As Army Gray Eagles fold into the Global Force Management Allocation Plan (GFMAP) and combatant commanders use them interchangeably with MQ-9s, the premise that enhanced training brings differentiation will be tested.

Trends highlighted in Chapter 4 will force the AF to change its training strategy. Automation, national airspace integration, and the shift to enlisted pilots will cause RPAs to flourish even more. This success in itself threatens the focused nature of RPA training. As RPAs and its missions proliferate, AF training will move from its niche of persistent attack to focus upon broader employment, rendering a Focused, Differentiation strategy obsolete. As the AF acquires unmanned transport aircraft, air-air platforms, or rotary wing aircraft, URT's RPA Fundamentals Course will no longer apply to all graduates. The 558 FTS will need either to amend or remove the course to keep training relevant. Automation threatens the current Focused, Differentiation strategy by reducing the need for flight training. Unless training incorporates additional skills to accentuate this trend, differentiation will not be achieved.

Moreover, the Congressional mandate to use enlisted pilots for RPAs threatens the current training strategy. Officers as pilots imply a better product on varying levels,

868 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

but success in the EPIC program will erode that belief. This could have far-reaching organizational consequences, as it could ultimately lead to the AF adopting an Army personnel model. Conversely, that RPA pilots receive well-rounded, comprehensive training brings with it the flexibility to adapt to new opportunities. The current training construct allows pivoting to new and possibly complex mission sets. Furthermore, the FAA considers the level of IFR training provided at URT the gold standard, and, as UAS integrates into the national airspace, URT graduates will be well prepared to take advantage of the opportunity.

	AF: Focused differentiation	Army: Focused Low Cost
Strengths	Delivers unique persistent attack capability -- Other AF platforms cannot -- Limited multi-role capability Integrated in AF culture -- Empowered, capable personnel -- Advocacy, CSAF/Congressional visibility	ISR focus -- LR and sensor suite training included Lowest cost -- High utilization rate via 24 hr ops -- Low labor costs -- Shorter timeline -- Able to outproduce poor retention
Weaknesses	Difficulty scaling to meet demand -- Longer training pipeline -- Unable to drive out competition Value of differentiation in doubt -- ISR accounts for 99% operational tasking -- Unique RPA architecture not maximized -- Army GFMAP support	Enlisted operators -- No vested advocate -- Low ranking SMEs Kinetic employment introduced
Opportunities	Well rounded, comprehensive training -- Allows scaling to more complicated missions -- Current construct allows pivoting to new mission sets -- IFR training best positions AF to implement UAS national airspace integration	
Threats	Automation reduces need for flight training Congressional mandate for enlisted pilots Poor retention expected increases burden

Recap

In review, this chapter covered several topics that led to identifying and analyzing the AF RPA community's Focused, Differentiation training strategy. It introduced SWOT analysis as the methodology to compare current and future training strategies. The chapter discussed RPA training in the greater scope of the AF's Strategic Master

869 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

Plan and security environment. The SMP identifies two vectors that inform future acquisitions and strategic direction as "high end" and "deterrence" related. Several national security experts posit that the US and its allies need opposite capabilities as war devolves within the boundaries of corruptly governed poor states. Training to employ sophisticated, expensive platforms in low-end conflicts may be problematic. Transitioning, this chapter identified comparison difficulties when assessing Army and AF programs due to different metrics, accounting methods, locations, and skills taught. Then, the chapter compared URT and MQ-9 Initial Qualification Training against UAS Common Core and Gray Eagle course. With the comparison as a backdrop, a Focused, Differentiation strategy was identified as the AF's current RPA training strategy. The AF has a tendency to gold plate its training as well as its equipment. Conversely, the Army employs a Focused, Low Cost Leadership strategy. Each strategy brings advantages and disadvantages.

Edgar Schein describes three stages of organizational life: early growth, midlife, and decline. Founders influence culture most in early growth, and they embed their beliefs by what they pay attention to and measure, how they allocate resources, rewards and status, and how they recruit, select, and promote.[19] Chapter 1 painted a descriptive picture of Generals Fogleman, Jumper, and Schwartz transmitting their values through formative decisions. Quality over quantity has recurred as a consistent theme, first when mandating rated officers and, now, when not rewarding commanders for graduating students on time. In midlife, cultural change mechanisms are from systematic promotion and technological seduction. As RPAs enter midlife, automation, national airspace integration, and the shift to enlisted pilots will inevitably bring RPAs out of its niche ISR market and into mainstream aviation. A Focused strategy is for organizations with small market share. When the preponderance of air platforms are RPAs, a Focused training strategy will no longer match its environment. Consequently, the AF will broaden its strategy into either Low Cost Leadership or Differentiation. As it transitions, they will also force assumptions about external adaptation to change. The next chapter will conduct a SWOT analysis of each strategy and recommend a future course of action.

870 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

Chapter 6
Other Strategies, Examined

Dr. Thomas P. Hughes, a noted historian, argues that, "younger developing systems tend to be more open to sociocultural influences while older, more mature systems prove to be more independent of outside influences and therefore more deterministic in nature."[20] If his hypothesis holds, as RPAs transition out of its initial growth phase into midlife, founders' leadership influence will wane, and technology will shape training more. Consequently, automation, national airspace integration, and the shift to enlisted pilots will inevitably bring RPAs out of its niche ISR market and into mainstream aviation. At that point, the AF will broaden its strategy into either Low Cost Leadership or Differentiation. This chapter first examines the possibility of joint training. The chapter then merges the insight gained into AF culture with the emerging threats and opportunities forecasted in Chapter 4 to consider, through a SWOT analysis, possible RPA training strategies going forward. A course of action is recommended. To conclude, the final step subjects the strategy recommendation to a five-question check as prescribed by Michael Porter. Porter argues that a good strategy creates and sustains competitive advantage by having a distinctive value proposition, a tailored value chain, trade-offs that are different from rivals, a good fit across the existing value chain, and continuity over time.[21]

Joint Training, the Obvious Solution?

> *We are disturbed that the Department of Defense has no standardized training program for UAS pilots and personnel. The continued lack of consistent and uniform training standards is simply unacceptable. In addition to collecting critical intelligence, the Department's UAS programs carry out sensitive strike missions that should require high standards and specialized training.*
>
> Senator John McCain, in letter to Secretary of Defense Ash Carter, 2015

This thesis originally intended to examine how the Army and AF have thus far justified separate training programs to Congress and what combined training would look like. On the surface, joint UAS training appears to be an obvious solution to the AF's staffing shortfall. The media and Congress have repeatedly inquired about merging UAS and RPA training into a single pipeline to create efficiencies.[22] Both services have dismissed the idea, and without civilian leaders intervening to force the issue, RPA training will probably remain service-specific. Despite operational context, societal pressures, and technology forcing the services to converge on UAS operations, the benefits of joint training are a mirage. Civilian leaders have the power to force joint training and deeper service interdependence of course, but their true motivations and the benefits of innovation lie in keeping them separate. Even Senator McCain's comment above may have ulterior motives. Fort Huachuca, Arizona, the site of the Army's only UAS training center, would serve as a likely location for joint training. Although duplication creates inefficiencies, it also creates competition. Civilian leaders use interservice rivalry to prevent shirking and encourage working. In his doctoral thesis on military innovation, Owen Cote posits that civilian leadership has structured the Department of Defense to function via interservice competition. The benefit is increased innovation: "Periods of intense and overt interservice competition in the US during the Cold War have covaried with periods of radical doctrinal innovation. Periods of relative interservice calm, or collusion, have covaried with periods of relative doctrinal stagnation."[23]

Had Cote written his thesis today, UAS stagnation under centralized control and innovation due to inter-service competition would be a persuasive case study. In *Air Force UAVs: The Secret History*, Thomas Ehrhard traces the stuttering progression of AF RPAs. He documents previous unsuccessful efforts to consolidate and centralize control of UAV development under the UAV Joint Program Office and the Defense Airborne

Reconnaissance Office. His report's final sentence captures his assessment: "The meteoric rise and fall of centralized UAV management provided strong evidence that 'pluralism and untidiness' indeed may be the only way for the US military to achieve weapon system innovation with the UAV."[24] Along with service-driven UAS innovation comes different platforms, different cultures, and different training approaches. Currently, the role of service rivalry in driving innovation outweighs potential gains in interdependence and interoperability

Should Congressional mandate override this arrangement, a viable joint URT would simply amalgamate Army and AF training to form a standardized foundation. A possible joint syllabus is quickly proposed here by taking portions from each service's training program and removing others. First, a joint syllabus would remove the contracted flight training course from the AF's training and change the final RPA fundamentals course to include more visual identification academics and scout maneuver fundamentals (depicted in Figure 22). Instrument qualification would remain, and the Predator/Reaper simulator training in the AF's final fundamentals course would be removed. The streamlined course would take 21 weeks and cost approximately $45k per student.

Figure 22: Possible Joint Undergraduate RPA Training Timeline
Source: Author's original work

873 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

This training pipeline requires concessions from both services, and both services would have valid objections. By moving more instruction to an earlier course, the Army would need to shorten its Gray Eagle course to focus on aircraft systems and employment. Overtraining Shadow UAS operators who do not need months of instrument flying rules would offset benefits gained. By eliminating RPA Flight Training, the AF would argue that its URT graduates would lack airmanship. In addition, unless the AF implemented personnel changes as well, commingled AF officers and Army enlisted would raise difficult questions over uniform wear, incentive pay, and off-duty expectations. Another difficulty JURT would face is responding to rapidly evolving capabilities and mission requirements. Whereas joint undergraduate pilot training has remained relatively unchanged for decades, URT adjusts frequently. In JURT, frequent joint staffing would be required to prevent program obsolescence, and managing the inevitable culture clash would be a significant hurdle. Edgar Schein presents three options to manage cultural conflict from a merger:

> The two cultures can be left alone to continue to evolve in their own way. A more likely scenario is that one culture will dominate and gradually either convert or excommunicate the members of the other culture. A third alternative is to blend the two cultures by selecting elements of both cultures for the new organization, either by letting new learning processes occur or by deliberately selecting elements of each culture for each of the major organizational processes.[25]

To broker disputes, the AF would make the most convincing bid for executive agency of the training program but could easily alienate the Army if it institutes doctrine heavy-handedly. Past URT, implementing joint training is not practical on different weapons systems. Each service develops its own UAS that require specialized training. Should civilian leadership force a joint acquisition, they could also naturally extend combined training.

In the only example of joint UAS training, the Marine Corps opportunistically sends officers to URT and enlisted marines to Army UAS training. As the Marine Corps considers purchasing MQ-9s, several officers attend URT each year. The Marine Corps currently operates the same Shadow UAS as the Army, and its enlisted operators go

[25] Edgar Schein, *Organizational Culture and Leadership*, 3rd ed. (San Francisco, CA: John Wiley & Sons, 2004), 316.

874 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

through the Army's Common Core and Shadow course. At course conclusion, the Marine officers and enlisted join for operational training where officers learn to lead and supervise in a tactical setting. This example is short-lived: as the Marine Corps transitions away from the Shadow to the RQ-21A Blackjack, they plan to standup service-specific training at Cherry Point Marine Corps Air Station, North Carolina.

Joint RPA training has several potential pitfalls but also several mitigating factors. Merging training is not a strategy; it is combining and selecting best practices. Some services can achieve efficiencies, but only in early training phases where instructors teach foundational skills. The minimal efficiencies gained arguably do not outweigh benefits of inter-service competition and innovation. Both services have dismissed the idea of joint training, and without civilian leaders intervening to force the issue, RPA training will remain service-specific. Despite its apparent benefits, joint training undercuts many of the goals and objectives civilian leaders most desire from their military services.

Low Cost Leadership

The AF's service-wide strategic bias for Differentiation does not mean RPA training has to follow suit. Rather, the RPA community could pursue a training strategy that embraces mass production aided by increasing automation, rising demand from RPA's national airspace integration, and societal pressures to enlist the RPA pilot force. Cost leadership is about minimizing the cost of delivering products or services. There are two different successful outcomes possible in a cost leadership strategy. The first is increasing the assets contributed to a combatant commander by the AF without expanding its budget. The second is maintaining its contribution and diverting leftover capital toward other demands.

A danger of pursuing a low cost strategy is confusing operational effectiveness (OE) as strategy. Low cost leadership uses mass production to leverage economies of scale. Amortizing overhead costs quickly and reducing direct variable costs create barriers to entry. Out producing adversaries serves as a deterrence or forces a less-threatening asymmetric response. Conversely, OE refers to a competitor's ability to perform similar activities better than rivals through execution or best practices. Quality management or continuous improvement programs are examples. Simply improving

875 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

operational effectiveness does not provide a robust competitive advantage because rarely are best practice advantages sustainable. Rivals quickly copy best practices, and frequent imitation results in hypercompetition.[26]

The three ways to reduce cost are to increase utilization rates, to control the value chain to ensure low costs, and to reduce overhead and direct costs. In many ways, the AF has streamlined its operations to maximize the first two methods. Utilization rates in the simulators and aircraft at the FTU are already high. Wing scheduling regularly programs 16-hour flying windows to accomplish as many training events as possible per day. Some instructors think allotted training times in the syllabus are generous, and even more events could be scheduled to increase instructor utilization.[27] The current daily flying window is long when compared to other AF flying programs. The MQ-9's primary sensor is an infrared video camera, meaning that night operations do not hamper training. The AF could gain higher utilization by instituting round the clock operations. In comparison, the Army UAS program operates 24 hours per day on weekdays. The AF uses remote split operations (RSO) in training, but diverting training sorties is not common enough to be seamless. Adverse local weather still cancels training sorties, thus lowering utilization and graduation rates.

Controlling the value chain is possible through renegotiated contracts with suppliers and manufacturers like General Atomics, but such an endeavor is enterprise-wide. Training platforms are bound to operational weapons systems. Contractor labor costs contribute to the value chain and are high for two reasons: remote training location and required instructional experience. Alamogordo, New Mexico, the home of Holloman AFB, is a small, desolate town not known for its expansive labor pool or amenities. Companies lure qualified contractors through higher salaries. Additionally, contractors can demand higher salaries because the various FTU syllabi teach multiple missions. This requires higher skilled employees. The town and businesses of Alamogordo rely heavily on the base as a source of revenue, and, therefore, moving the FTU and its

[26] Magretta, 1108.

[27] 9th ATKS instructor pilot at Holloman AFB, NM, interview by the author, 22 December 2016.

876 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

associated labor pool to somewhere less costly is politically difficult. Conversely, URT has neither problem. San Antonio offers amenities and provides a deeper labor pool of AF retirees and flight instructors in general.

The greatest value savings is in reducing direct costs. Reducing mission sets or eliminating courses instantly shortens the pipeline. Moving live sorties to the simulator is cheaper and more reliable, and as better simulators come on line, differentiating between the two will become more difficult. Replacing officer pilots with enlisted operators reduces labor costs immediately. As those enlisted operators complete their active duty service commitment, lower paid contractor opportunities will appear attractive. Two ensuing side effects counteract. One, contractor opportunities will tempt more enlisted operators to leave the AF. Two, the AF provides many of those contractor opportunities and can offer lower contracts. The Army UAS pipeline produces its enlisted operators using methods that are easily replicated. Accordingly, its strategy falls under the category of operational effectiveness.

Without making significant structural changes or changes that are difficult to imitate, the AF can emulate the Army UAS pipeline to silence critics and improve production. In a lightly implemented low cost strategy, the AF could adopt the Army's best practices. Eliminating URT's initial flight training would trim URT by 1 month and save $10k. By instructing enlisted operators in only emergency procedures, aircraft handling, ISR, and Basic Surface Attack, squadrons could reduce the MQ-9 course by 5 weeks, a 30% reduction. Without further costs or increased manning, the FTU squadrons could graduate 50% more students in the same time. The AF would save $104k by eliminating 11 flying sorties, 7 simulator sorties, 41 hours of academic instruction, and $3.5k in per diem costs per student. This would push the training burden downstream to operational squadrons, but those squadrons would provide additional mission training when needed and in an applicable format. Squadrons already tailor mission qualification training to a squadron's designed operational capabilities (DOC) statement and provide follow-on upgrades when experience allows. This just scratches the surface of potential.

877 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

Low cost leadership typically means generalization. In the age of specialization, though, carefully combining sheer size with required skills can achieve low cost. An analogy is a large hospital with many surgeons. Each surgeon brings valuable knowledge, but no single doctor knows every procedure or technique. During a procedure, surgeons operate as teams to complement each other's skill set. Having doctors narrow their field of study does several things. One, it reduces the education burden while allowing deep expertise. Already, medical school, residency, and specializations consume years and possibly decades of study and training. Medical students achieve familiarity in a core curriculum and in-depth knowledge in an area of interest. In-depth knowledge provides the most value. Two, specialization enables proficiency and currency. Surgeons repeatedly apply their skills to similar medical situations. That focused practice keeps their skills honed, and their knowledge current. Three, surgeons in an operating room create efficiencies by complementing each other's skills. The result is that when each doctor brings a skill to surgery, a team can perform operations that are more complicated better.

Manned aircraft platforms have adopted primary missions that suit their aircraft flying characteristics and capabilities. This specialization complements a strike package the way a surgeon supplements an operating room. Pilots, to a much lesser extent, attempt to do the same when they focus on one particular airframe and develop the specific skills to fly that aircraft. However, skill sets cannot subdivide further. Physics dictates that all pilots must know how to conduct basic skills like takeoff, land, transit, talk to agencies on the radio, mission plan, fly on instruments, and handle emergency procedures. The RPA architecture is not bounded by those restrictions, but current operational and training practices barely scratch the surface of modularity possible. Operational squadrons use specified individuals to lead strikes, and aircrew cycle through the ground control station cockpits when fatigued. Otherwise, to minimize risk, RPA pilots are expected to perform in all stages of flight that may occur between the gaining handover and the losing handover. Having aircrew specialize in specific phases of flight would result in higher performance, increased currency, and much lower training costs. This would entail a paradigm shift away from an independent decision maker and toward a networked operator. Low cost through specialization works as long as the skill set can

878 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

be accessed when needed. RSO creates efficiency by concentrating its personnel; it is an ideal operational model for specialization. Conversely, organic Army units, by definition, are decentralized and cannot specialize.

A second, more ambitious strategy builds on the first and further exploits RPA's modular capabilities. Strengths include a reduced training pipeline, easier scalability, and exploiting RPA's unique RSO architecture. A pared down core curriculum would introduce fundamental skills like gaining and losing handovers, aircraft handling, airspace transit, and ISR. Rather than 22 sorties in the current syllabus, only 8, maybe less, would be required. In Mission Qualification Training or, ideally, in later upgrades, individual operational squadrons would teach skill sets like emergency procedures, Basic Surface Attack, Surface Attack Tactics, Close Air Support, and Combat Search and Rescue as their area of responsibility required. The cost and time savings in such a strategy would be dramatic, but operational squadrons would have to alter the way they operate and how they manage and schedule their personnel. The strategy would force squadrons to transition from several independently operating aircrew to a networked, interdependent operation. This takes advantage of AF RPA's unique architecture in a way adversaries and other services would have difficulty imitating. Efficiency and networked operations do incur risk. Weaknesses include transferring the training burden to operational squadrons, cultural acceptance by a wider AF that prizes the anachronous independent decision maker, and difficulty managing personnel. Operations that parcel out skills more efficiently and sparingly reduce a squadron's ability to handle low probability events like multiple time-critical emergencies or intricate kinetic strikes.

Current trends provide opportunities and threats to a low cost leadership strategy. As automation increases in capabilities, it will drive manpower and training requirements down further. In a low cost construct, when specialized skills become obsolete, course modules can be easily eliminated. Society and technology are already network centric; specialized training serves as a mechanism to force the RPA community to network. Modular training also complements the enlisted pilot mandate and the AF's current enlisted force structure. Qualifying RPA pilots initially as 3-level apprentices equates to the AF's current classification system. As the RPA pilot gains further specialized skills, he can transition to a 5-level journeyman, then 7-level craftsman, and finally a 9-level

879 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

superintendent. Graduated qualifications make attrition less costly. A modular, enlisted-based system also repositions officers as mission commanders and supervisors. It allows focused training on employing a complete weapons system through leadership, reaffirming an ideal officer/enlisted construct. Pending UAS national airspace integration means more growth. Having a scalable training system will ensure that the AF can respond quickly to shape the environment and maximize new opportunities.

Although the strategy presented attempts to leverage US and AF advantages, other nations are intently watching the AF execute. The AF should expect both adversaries and allies to adopt proven best practices. The greatest threat though is existential. If automation and artificial intelligence drive pilots further from the cockpit and commoditize air-mindedness, is a separate AF justified? Martin van Creveld in his "Rise and Fall of Air Power" argues that it is not. He concludes that, with the possible exception of space vehicles, there is "no convincing reason why they should be part of an independent service. Supposing that twenty-first-century wars will be mainly of the low-intensity kind...there probably is no compelling case for independent air power at all.[28] A low cost strategy will not cause this shift, but it will hasten it.

Differentiation Strategy:

A differentiation strategy complements the AF's Strategic Master Plan and is a grander version of today's RPA training strategy. It values high quality training and maximizing a platform's capabilities. To execute a differentiation strategy successfully, the AF needs to continue its current vector: good research and development; the ability to deliver high-quality services; and effective communication to justify the differentiated offerings' price premium. While current efforts to distinguish added capabilities lack appreciation, as future full spectrum capabilities come online, the AF will have the right personnel in place to optimize them. Complicated, complex weapon systems that deliver strategic effects will validate this strategy's price premium.

The RPA community has grown and developed under heavy influence from the wider AF. As the AF's largest community, the reverse is starting to take place. Its size and resource requirements mean that it is influencing AF culture. A training strategy

881 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

inline with the Strategic Master Plan will be more readily received. Jeff Smith in *Tomorrow's Air Force* surmises, "There are signs that the USAF is moving toward major organizational change that will focus on the full spectrum of war rather than on a particular facet, context, or weapon system."[29] RPAs transcend conventional thought about weapon systems; they cross cyber, space, and air domains easily. RPAs jump instantly from tactical intelligence gathering to strategic interdiction. RPAs represent this organizational change, and its maturing officer corps is well positioned to lead tomorrow's Air Force. Ensuring institutional recognition through promotion nurtures RPA's advancement. Promoting talent within is critical, and a differentiation training strategy cultivates that talent.

The differentiation strategy does not change the current problem of scaling to meet demand. The current MQ-9 syllabus is an optimistic 77 training days long. A revised syllabus currently in staffing adds 15 more planned days; this trend is in the wrong direction. Furthermore, what warfighters consider low-end capability requiring little training is outpacing high-end growth and will squeeze the AF into narrower responsibilities. UAS growth has been at low price points, exactly where the value of differentiation is in doubt. The glaring question is, if premium training is not appreciated now, what will more automation do?

A differentiation training strategy makes logical sense as the UAS capability envelope expands and unmanned aircraft further models manned aircraft training. The differentiation strategy presents several opportunities. The primary opportunity of pursuing high-end platforms and training is extending current airpower capabilities beyond manned aircraft limitations. Relegating low-end missions to the Army reduces inter-service rivalry and ensures a peaceful coexistence (Figure 24). Fully exploring options at the intersection of network centric warfare, RSO, and unmanned flight will require talented, empowered warfighters that fully understand UAS potential and limitations. Operating in contested, degraded environments is a barrier to wider RPA employment. Whether solving that problem technologically or tactically, talented, well-trained personnel are needed. As UAS proliferates and off-the-shelf technology reduces

882 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

the AF's competitive advantage, knowledge will be the deciding advantage. Additionally, in the early days of airspace integration, trust from society and regulators will be low until a track record is established. If the AF retains its reputation for highly trained RPA pilots, not only will integration be smoother and more expansive, but the AF will have first mover advantage into the airspace.

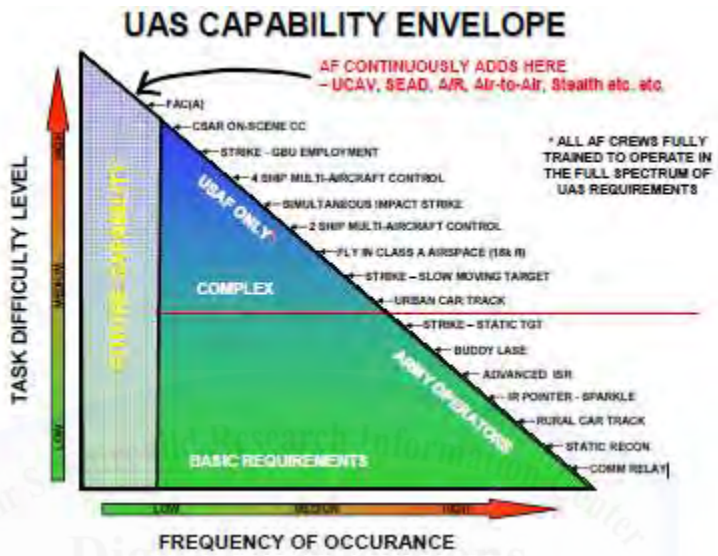

Figure 24: USAF and Army UAS Interdependence Model
Source: Major Travis A. Burdine, ""Organic" Army Unmanned Aircraft Systems: The Unhealthy Choice for the Joint Operational Environment" (Air Command and Staff College, Air University, 2008, 29.

Significant threats loom for a differentiation strategy. If the security environment favors frequent low intensity conflicts, high-end capabilities developed through differentiation are good for conventional deterrence but not for real world conflict. In addition, automation is moving the pilot further away from the cockpit and reducing the need for training not increasing it. Moreover, the Congressional mandate for enlisted pilots favors simplifying training and reorganizing the force structure. Poor expected retention will increase the training burden and further test this strategy.

Differentiation Training Strategy

	AF	Army (Focused Low Cost Leadership)
Strengths	Training to push aircraft capabilities -- Full multi-role capability -- Knowledge to pursue unique RPA architecture Influences AF culture; in line with SMP -- Future senior leaders in rise of RPA generals -- Advocacy, CSAF/Congressional visibility	ISR focus -- LR and sensor suite training included Lowest cost -- High utilization rate via 24 hr ops -- Low labor costs -- Shorter timeline -- Able to outproduce poor retention
Weaknesses	Difficulty scaling to meet demand -- Longer training pipeline -- Unable to drive out competition Value of differentiation in doubt at low end	Enlisted operators -- No vested advocate -- Low ranking SMEs Kinetic employment introduced
Opportunities	Well rounded, comprehensive training -- Allows scaling to new platforms, move closer towards full spectrum capabilities -- Current construct allows pivoting to new, more complicated mission sets -- IFR training best positions AF to implement UAS national airspace integration	
Threats	Low end conflicts mismatch for capability Automation reduces need for flight training, trend moving pilot further away from cockpit Congressional mandate for enlisted pilots Poor retention expected increases burden

Strategy Recommendation:

A Low Cost Leadership training strategy with low initial training requirements supplemented by follow-on specialized training is the AF's best way forward. A successful low cost strategy will produce enough qualified graduates to satisfy growing needs while allowing follow-on skill specialization. Skill specialization in turn enables differentiation. Unclear prioritization in implementation will blur a low cost and a differentiation strategy and yield muddled results. For example, if the AF develops an RPA air-air platform, it would replace current manned platforms only if the cost-benefit ratio improved. Is this Low Cost Leadership strategy or Differentiation? The dilemma is not whether to eschew the full spectrum of air power in the pursuit of low cost. The question is what should be prioritized. In implementation, a strategy and, therefore, a culture is made apparent by what is prioritized and what metrics are tracked. Ironically, a successful Low Cost Leadership training strategy introduces Differentiation.

884 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

The five tests of a good strategy include an examination of whether the proposal brings a unique value proposition, a tailored value chain, trade-offs that are different from rivals, a good fit across the value chain, and continuity over time.[30] A value proposition asks whether distinct value is being offered to a chosen set of customers at the right relative price. In a Low Cost Leadership strategy, end customers are combatant commanders and never the services tasked to organize, train, and equip. Combatant commanders' chief, unquenchable desire is for more information. Air power has a proven ability to provide valuable intelligence especially in areas difficult to access otherwise. If customers value quantity over quality, high price sensitivity requires discount pricing and ready availability.

A Low Cost Leadership strategy delivers a tailored value chain. Remote split operations counter Army aviation doctrine of decentralizing assets. The Army has reluctantly investigated RSO to fulfill requirements in Syria and Iraq; it is a model that forces divisions to relinquish control of their assets. Conversely, AF doctrine espouses centralized command, and RSO fits well with that air power tenet. Remote split operations is the key enabling piece in driving a low cost training strategy.

A strategy that relies on low initial training and then further specialization provides low cost but does have unique trade-offs. The downside to this low cost strategy is that few single operators would possess the knowledge to operate in isolation. The assumption is that more value lies in a group of personnel with highly specialized skills than with generalists. The Army designs its companies as generalists so they can deploy as organic assets in direct support of divisions or brigade combat teams.

Pursuing a different strategy than the wider AF, albeit just in training, comes with risks. The fourth test asks whether pursuing a low cost training strategy would be enhanced by other AF activities. Yes, the AF has the support structure required for any flying activity like restricted training airspace, runways, staffing, and transferable experience. The misfit, especially if not communicated effectively, is cultural. A pitfall for low cost producers is poor quality and a poor reputation. The AF prides itself on the

885 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

exact opposite. Inevitably, though, technological trends will carry more force than cultural legacies (Figure 26).

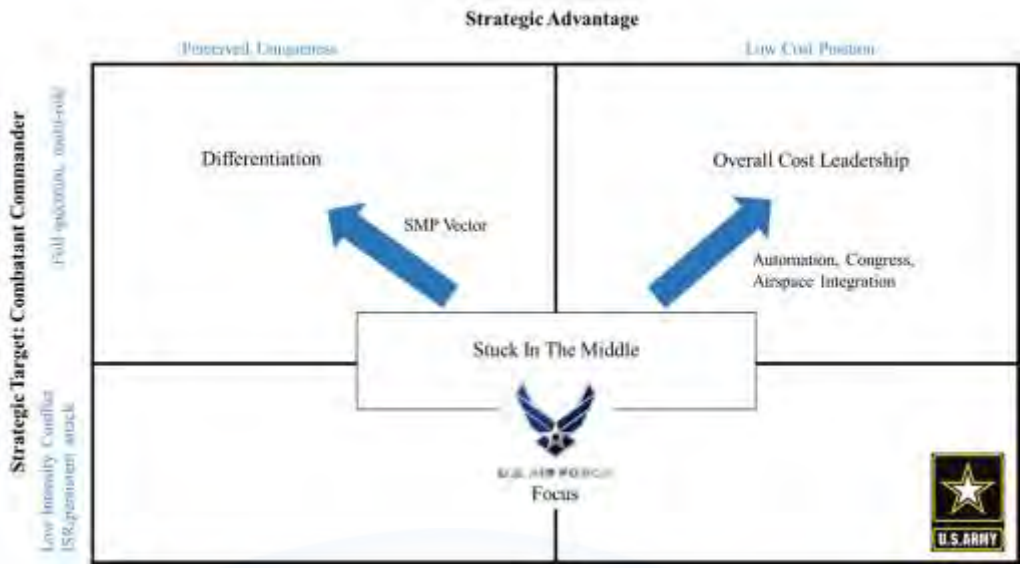

Figure 26: AF and Army UAS Employment and Training Strategy
Source: Author's original work

Finally, the strategy departs from current practices but does so flexibly. Operational squadrons already carry out upgrade training and have tiered operators titled wingman, flight leads, and instructors. A strategy provides a general vector whereby training syllabi are slowly reduced or divided into separate courses and organizations slowly adjust.

Recap

Automation, national airspace integration, and the shift to enlisted pilots will force the AF to broaden its strategy into either Low Cost Leadership or Differentiation. A SWOT analysis highlighted the advantages and disadvantages of each strategy. Based on that analysis, a Low Cost Leadership strategy is the best future course of action. Evaluating that course of action highlighted potential cultural conflict as the wider AF pursues a differentiated, high-end Strategic Master Plan. Based on how the AF employs RPAs, a Low Cost Leadership training strategy provides the AF a distinctive competitive advantage not only in comparison to the Army but to adversary air forces and allies alike. The recommended approach to low cost training is much different than the Army's current model. Using RSO provides modularity; it is an advantage not easily modeled

886 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

and requires extensive multi-domain support. Producing enough timely RPA pilots to meet the demand for ISR collection is the customers' priority. Less time in military training equates to less cost. Finally, the proposed strategy is unique amongst all aviation training, and it is this strategy rather than competing on execution or in a race to the bottom line that will sustain the RPA community in the future.

Conclusion

Independence—one of the hallmark traits of military aviators, is challenged by the connectivity of UAVs.

Major Houston Cantwell, *Beyond Butterflies*

UAS training evolved differently under the AF and Army due to to their different starting points and respective cultural influences. The surge of American forces into Iraq in 2007 highlighted the AF's lingering resistance to expand its RPA force. Up to that point, the AF had borrowed from the existing fighter and bomber pool to pilot its RPAs while keeping its RPA pilot training pipeline on hold. AF senior leaders explicitly desired rated pilots to fill RPA cockpits in stark comparison to Army UAS enlisted operators. When pressure grew to provide more combat lines, the AF and a new Chief of Staff responded by rapidly instituting a dedicated RPA pilot training pipeline to produce specialized unmanned operators. The training model mimicked other AF undergraduate training programs like UPT and UNT. It was those two things, the initial insistence to operate RPAs with rated pilot officers and building URT from other rated programs, that both reflected and reinforced the AF's cultural influence on the RPA community.

Conversely, the Army's UAS training community started with small, remote-controlled drones over 25 years ago at Fort Huachuca, Arizona. It has grown and expanded into new platforms with new capabilities, but its model based on universal enlisted operators trained to operate as an organic divisional asset remains. The focus on efficiency has streamlined the training pipeline. Notably, at the operational level, flexibility is prized over efficiency and possibly effectiveness. Soldiers are trained to fly the Gray Eagle, to operate its payloads, to conduct certain maintenance items, and to handle basing requirements. The decentralized approach incurs costs in its specialized focus and in high end capability potential. It also costs in reduced readiness levels. Poor retention plagues the community, but current production meets needed replacement demand. Ultimately, the underlying focus remains to support and enable the ground forces commander and his mission. The artifacts, values, and assumptions are in accordance with that focus. Such simplicity has led to practical and sustainable decision making in regards to UAS.

888 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

The AF, in building the RPA training pipeline, reaffirmed its underlying assumptions rather than reevaluating them. The notion that RPAs are just like manned aircraft but remotely piloted continues as the AF pursues 65 initiatives in its RPA Get-Well Initiatives and Culture and Process Improvement Programs. A quick example of this alignment is renaming Ground Control Stations (GCS) to cockpits. The result is that each training program creates a different product and, in turn, reflects institutional disagreement over what skills should be imparted. This is despite similar end-state capabilities, at least similar enough to end state customers. This conflict between utility and tradition has yet to profoundly ripple through the AF, whose raison d'etre is to fly, fight, and win—in air, space and cyberspace.

The current AF training model has struggled to meet rising demand. Rather than accommodating AF tardiness, combatant commanders have looked elsewhere. As Global Force Management Allocation Plan needs are filled by Army Gray Eagles, skill differentiation is called into question. Moreover, three emerging trends--automation, enlisted pilots, and national airspace integration--will either exacerbate this demand/supply gap or force the AF to reevaluate its RPA training strategy. An analysis combining AF RPA strengths and weakness with the opportunities and threats these emerging trends brings recommends the transition to a low cost strategy to leverage remote-split operations and the modularity it provides. Prioritizing low cost achieves mass production which in turn creates more opportunity for modularity. This is the training paradigm that can achieve cost-prioritized differentiation.

A Low Cost Leadership strategy adopts automation and welcomes its irresistible rise. While automation threatens a differentiated training strategy by undermining the value of training provided, a low cost strategy views automation as an opportunity. Regardless, the unstoppable march of technology will shape AF operations and subsequently training. Automation combined with network centric warfare will force internal meaning making, and the result will be a dramatic culture shift.

Modularity undercuts an underlying assumption deeply held by the AF that aviation requires airmen instead of chauffeurs, independent decision makers instead of operators. This is a key justification for officers as pilots, but it is in contradiction to RPA's true advantage: network-centric operations. This struggle has played out since

889 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

1900, when Wilbur Wright wrote to Octave Chanute conjecturing that flight required piloting skill more than machine stability.[1] That skill subsequently meant differentiation from society. Different characterizations of pilots would evolve, but a dominant theme that aviators were more than machine operators, that they were independent professionals, emerged. The notion developed that aviators were "mechanical angels, carrying the 'winged gospel' of modernity" rather than chauffeurs.[2] Technological developments like autopilot, flight instruments, and now, automation and networked operations have modified this image. Automation and networked operations reduce individual control but lends tremendous opportunities. The stability gained enable longer flights, less physical risk, real-time intelligence dissemination, and quicker responses. Automation and networked machines may also hold the key to solving current operational dilemmas in contested, degraded environments or against anti-access adversarial strategies. It may also be hastening the end of the pilot as we know it.

Ultimately, this transition is indicative of the broader knowledge economy, but it creates an uncertain future for the AF. As technology advances, less importance is placed on activities that can be replaced by automation, and more on decision making and judgment. The rise of the RPA has highlighted the many external adaptations required to fully exploit these emerging capabilities, and these capabilities possible are barely being realized. The AF has evolved since its origin, and as groups evolve, "the assumptions they develop… reflect deeper assumptions about more abstract general issues around which humans need consensus in order to have any kind of society at all."[3] It is these deep assumptions that provide strongest resistance when threatened, but automation and connectivity are driving its change within the AF. The AF has yet to accept this trend, and it undermines its commitment to innovate through air power. How the AF attempts to make meaning of its external stimuli will reflect its deep cultural assumptions. In turn, how successful the AF response is will determine how drastic its culture will be affected.

Technological determinism makes transition inevitable, and AF culture will evolve. While how the AF will be forced to change and what it will look like is subject

890 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

to conjecture, determining a proactive, viable strategy based on theory and doctrine to leverage technology is vital. If steps are not taken to leverage opportunities technology provides, technology will dictate a passive, incoherent strategy. In addressing space strategy but applicable to any competitive enterprise dominated by technology, Everett Dolman stated,

> The difference between theory or doctrine-driven strategy and, say, technology-driven strategy is profound. The first integrates new technology into a coherent vision; the latter abandons foresight and follows the apparatus wherever it leads. One is proactive, the other reactive. One wins, the other loses.[4]

In years past, independent decision makers were required to pilot aircraft. As those pilots were promoted in rank, they transitioned to organizational decision makers and strategists. The AF built their institutional personnel model off this phenomenon. In the near future, independent decision makers will not be required to operate aircraft but to command missions. "Human commanders will need to control swarms at the mission level, giving overarching guidance, but delegating a wide range of tasks to autonomous systems. In the near term, this will entail a shift to mission-level autonomy and multi-vehicle control. In the long term, new command-and-control models are needed to allow humans to employ large swarms effectively."[5] What is most threatening is that this Army model is the future AF model.

HQDA/DUSA

11. SPONSOR/MONITOR'S REPORT NUMBER(S)

12. DISTRIBUTION/AVAILABILITY STATEMENT
Distribution Statement A. Approved for public release; distribution is unlimited.

13. SUPPLEMENTARY NOTES
The Army Science Board is the senior scientific advisory body for the Department of the Army and is chartered as a Federal Advisory Committee organized under the Federal Advisory Committee Act.

14. ABSTRACT

The purpose of the study was to provide a review of current Army, Navy/USMC, Air Force, DARPA, OSD, NASA and industry aviation S&T plans, and to assess the use of innovative technologies that increase capabilities, overall mission effectiveness, survivability and lethality, while reducing sustainment requirements. From those reviews, the study team recommended the Army (1) conduct operational effectiveness analyses on system-of system concepts; (2) assess heavy vertical lift options; (3) revise the unmanned aerial system road map; and (4) develop manned/unmanned teaming systems.

15. SUBJECT TERMS
Army aviation, vertical lift, manned/unmanned teaming (MUM-T)

INSTRUCTIONS FOR COMPLETING SF 298

1. REPORT DATE. Full publication date, including day, month, if available. Must cite at least the year and be Year 2000 compliant, e.g. 30-06-1998; xx-06-1998; xx-xx-1998.

2. REPORT TYPE. State the type of report, such as final, technical, interim, memorandum, master's thesis, progress, quarterly, research, special, group study, etc.

3. DATES COVERED. Indicate the time during which the work was performed and the report was written, e.g., Jun 1997 - Jun 1998; 1-10 Jun 1996; May - Nov 1998; Nov 1998.

4. TITLE. Enter title and subtitle with volume number and part number, if applicable. On classified documents, enter the title classification in parentheses.

5a. CONTRACT NUMBER. Enter all contract numbers as they appear in the report, e.g. F33615-86-C-5169.

5b. GRANT NUMBER. Enter all grant numbers as they appear in the report, e.g. AFOSR-82-1234.

5c. PROGRAM ELEMENT NUMBER. Enter all program element numbers as they appear in the report, e.g. 61101A.

5d. PROJECT NUMBER. Enter all project numbers as they appear in the report, e.g. 1F665702D1257; ILIR.

5e. TASK NUMBER. Enter all task numbers as they appear in the report, e.g. 05; RF0330201; T4112.

5f. WORK UNIT NUMBER. Enter all work unit numbers as they appear in the report, e.g. 001; AFAPL30480105.

6. AUTHOR(S). Enter name(s) of person(s) responsible for writing the report, performing the research, or credited with the content of the report. The form of entry is the last name, first name, middle initial, and additional qualifiers separated by commas, e.g. Smith, Richard, J, Jr.

7. PERFORMING ORGANIZATION NAME(S) AND ADDRESS(ES). Self-explanatory.

8. PERFORMING ORGANIZATION REPORT NUMBER. Enter all unique alphanumeric report numbers assigned by the performing organization, e.g. BRL-1234; AFWL-TR-85-4017-Vol-21-PT-2.

9. SPONSORING/MONITORING AGENCY NAME(S) AND ADDRESS(ES). Enter the name and address of the organization(s) financially responsible for and monitoring the work.

10. SPONSOR/MONITOR'S ACRONYM(S). Enter, if available, e.g. BRL, ARDEC, NADC.

11. SPONSOR/MONITOR'S REPORT NUMBER(S). Enter report number as assigned by the sponsoring/ monitoring agency, if available, e.g. BRL-TR-829; -215.

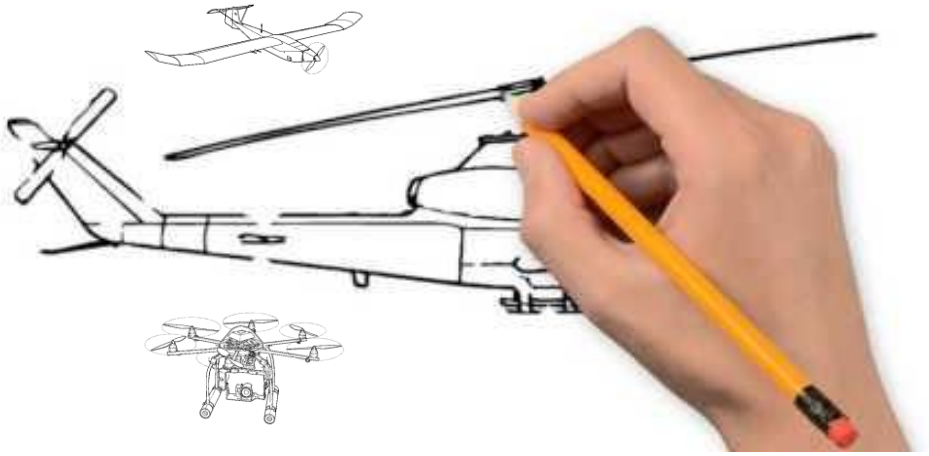
12. DISTRIBUTION/AVAILABILITY STATEMENT. Use agency-mandated availability statements to indicate the public availability or distribution limitations of the report. If additional limitations/ restrictions or special markings are indicated, follow agency authorization procedures, e.g. RD/FRD, PROPIN, ITAR, etc. Include copyright information.

13. SUPPLEMENTARY NOTES. Enter information not included elsewhere such as: prepared in cooperation with; translation of; report supersedes; old edition number, etc.

14. ABSTRACT. A brief (approximately 200 words) factual summary of the most significant information.

15. SUBJECT TERMS. Key words or phrases identifying major concepts in the report.

16. SECURITY CLASSIFICATION. Enter security classification in accordance with security classification regulations, e.g. U, C, S, etc. If this form contains classified information, stamp classification level on the top and bottom of this page.



17. LIMITATION OF ABSTRACT. This block must be completed to assign a distribution limitation to the abstract. Enter UU (Unclassified Unlimited) or SAR (Same as Report). An entry in this block is necessary if the abstract is to be limited.

EXECUTIVE SUMMARY - THE FUTURE OF ARMY AVIATION

This study was conducted by the Army Science Board (ASB) from January 2015 – October 2015 under the sponsorship of the HQDA G-3/5/7. The reference task title for the study is "Army Science and Technology for Army Aviation 2025-2040." As stated in the Terms of Reference (TOR) signed by the Secretary of the Army, the overarching objective of the study was to identify and assess Science and Technology (S&T) enhancements capable of being fielded during the 2025 – 2040 timeframe that will:

- Increase Army Aviation's expeditionary capabilities to support full-spectrum military operations, and
- Reduce its sustainment tails and logistics footprint.

Fundamental to making any recommendations on S&T enhancements for Army Aviation in 2025-2040 is the assumption that the character of warfare is changing and that the role of Army Aviation in this future must also change. The character of warfare is clearly evolving rapidly, evidenced by significant new threats to Army Aviation and indications that they will continue to grow. These threats span the spectrum from sophisticated next-generation air defenses to capabilities that utilize widely available inexpensive assets, such as swarms of small Unmanned Aircraft Systems (UAS), which can be easily procured through commercial outlets.

The study team believes that the most promising opportunity to overcome these threats is a "system of systems" approach involving formations of manned vertical lift aircraft and unmanned aircraft systems tied together by manned-unmanned teaming (MUM-T). The technical performance required of the "aviation system" and the elements needed in these various operational scenarios must be determined. Thus, a specific starting point and our most important recommendation, is to perform operational effective analyses that will inform the details of needed technical systems that incorporate emerging technologies and quantify requirements for these systems.

The study team identified the more general technology trends and opportunities that should enable viable solution options for addressing the threat space, as well as improve safety, lethality, and survivability for the manned-platforms, while reducing life cycle cost. Viewing Army Aviation as a complex system, a "system of systems," requires enhancements and development of the various systems and components. An enhanced investment in Army Aviation Research and Development (R&D), with greater focus on evolving capabilities in several areas to include UAS and autonomy, will enable a new "Army aviation system" to be fielded in 2025-2040 and provide the S&T foundation for a rapid evolution of capability beyond 2040. We also noted that the current timelines for development and fielding of several new systems are driven more by funding availability than by technology limits. Increased focus aviation R&D will permit rapid development of truly "integrated" systems, leading to more rapid fielding of the needed formations of systems.

907 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

The Army Science Board had previously conducted three recent studies that provided relevant background for global trends in science and technology (S&T) and that identified the opportunities and challenges that are likely to face the Army in this time period (2025-2040):

1. "The Strategic Direction for Army Science and Technology" (2012)
2. "Army Science and Technology Essential Core Competencies" (2013)
3. "Decisive Army Strategic and Expeditionary Maneuver" (2014)

The ASB has recognized that as the global rate of change of S&T continues to increase, the technical and operational challenges and opportunities for the conduct of warfare in this period should also increase.

In conducting the study, the team made more than 30 visits to Government and industry organizations and reviewed over 500 documents. Visits with Mr. John Shipley (Army Special Operations Aviation), LTG Kevin Mangum (Deputy Commanding General, TRADOC), MG Michael Lundy (Commanding General, US Army Aviation Center of Excellence) and others in the intelligence community, were particularly illuminating for the team in that they provided specific information concerning the severity and complexity of both current and recognized future threats to Army Aviation. These threats (and potential opportunities) include those from cyber, lasers, the electromagnetic spectrum, UAS swarms, and MANPADS. While the threats identified are important to Joint and coalition aviation in general, the lower-altitude environment of Army Aviation is particularly problematic for portions of the potential threat space.

The extensive input gained through all of these visits and interactions provided the study team the background to form a consensus and clear "working assumption" that the character of war is changing rapidly and the proliferation of relatively low-cost and evolving threats will only increase and become more uncertain by 2025 and beyond. Thus, the current military aviation environment and the rapid evolution of adversary options provided the study team a contextual input that went beyond technologies that may be useful in individual aviation vehicles and/or weapons systems.

The study team found that the Future Vertical Lift (FVL) family of systems represents the current planning for future of Army Aviation manned (and optionally manned) vertical lift systems. FVL is currently an initiative within the Army Aviation S&T portfolio and is not expected to become a Program of Record (POR) until after the current Program Objective Memorandum (POM). It was noted that the cost of the heavy lift option may preclude it from being a viable option. The team found that several significant technology initiatives within the Army Aviation S&T portfolio apply to both legacy and future manned systems. These technologies include ITEP/FATE engine insertion, DVE capabilities, CBM/PHM capabilities, ASE improvements, and greater MUM-T. Current Army Aviation UAS assets consist of the Raven, Puma, Shadow, and Gray Eagle systems. These systems are all fixed-wing, have limited autonomy and limited MUM-T capability, and are essentially dedicated to one or two mission areas.

The study team organized the findings and recommendations of the study into three categories/recommendation sections:

908 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

- Context: Character of Warfare in 2025 and Role of Army Aviation
- Addressing Capability Gaps: Development and Acquisition
- S&T Portfolio: Innovation and Game Changers

As stated earlier, the most important recommendation is to perform operational effective analyses that will inform the details of needed technical systems that incorporate emerging technologies and quantify requirements for these systems. Following from this recommendation, the study team suggests that the envisioned aviation fighting "system" would generally have more than one vehicle/system participating, and has used the phrase "system of systems" to describe the approach. Also in the first category/recommendation section, the study team recommended that, if heavy lift is determined to be cost-prohibitive, it should not be assumed to be available in analyses, wargames, and exercises.

The future Army Aviation capability must include an expanded use of UAS assets that are, in most cases, viewed as "complements" and "extensions" to manned aviation. Enablers for near-term options would require work in UASs, mission systems, aviation systems integration, and the development of testbeds to develop and validate technical and operational concepts. The study team also recognized the importance of cost and speed in the introduction, acquisition and operation of more capable future Army Aviation "systems." Following from these general observations, in the second category/recommendation section, the study team found that the capability gaps to enable viable options in the 2025-2040 time period would very likely need increased emphasis in the following areas:

- Unmanned Aircraft System (UAS) Vehicles
- Modernization of Legacy Rotorcraft Systems
- Future Vertical Lift (FVL) Acquisition with Speed and Simplicity
- Aviation Mission Systems
- Aviation Systems Integration and Testbed

The need for a strong aviation S&T portfolio to enable new options in this rapidly changing 21st century environment is also needed. In the third category/recommendation section, the study team found that due to the dynamic nature of the global technology environment, there exists a needed for increased emphasis in the following areas:

- Advanced and Disruptive Systems S&T
- S&T Investment Strategy

A summary of the key recommendations for each of the three categories/recommendation sections follows. Note that these recommendations are not in priority order but rather in hierarchical order beginning with system of system recommendations, followed by technology building blocks, and then by preparing to address emerging technology through S&T investment. The team believes that all nine recommendations are essential to the future of Army aviation. The first recommendation, to perform system of systems operational analyses must be acted on first because it will provide details to define the remaining recommendations. It is anticipated

909 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

that the analyses will indicate that some areas require more improvement than others and hence are more urgent and require great investment. For example, UAS development will most likely require greater investment. The emphasis on early integration of these building block areas is also essential for the "Future Army Aviation system of systems" to be optimized and effective in the field.

Recommendations for Context: Character of Warfare in 2025 and Role of Army Aviation

1. System of Systems Operational Effectiveness Analyses: The ASB recommends that TRADOC conduct operational effectiveness analyses of potential system of systems concepts in a cost-constrained environment that address capability gaps for Army Aviation in 2025 and beyond in complex threat environments. Concepts should include holistic air-ground approaches, high/low mixes of collaborative manned/unmanned systems, FVL performance characteristics, higher levels of autonomy, PNT in denied GPS environments, attritable UAS assets, and enhanced lethality of DE weapons. These analyses must include the development of CONOPS and architectures for the most cost-effective concepts. As mentioned before, this is the most important recommendation. Army aviation must move away from the platform-centric approach currently employed to that of a system of systems. The significant advantages to Army Aviation of such an approach for survivability and lethality with its corresponding great potential cost advantages must be embraced moving forward. The results of these systems of systems operational effectiveness analyses are critical in guiding the path forward for Recommendations 3 – 6.

2. Affordability of Heavy Vertical Lift: The ASB recommends that TRADOC assess interim and future heavy vertical lift options for meeting Army CONOPS and documented JCIDS capability needs for expeditionary and operational maneuver and recommend the road ahead. If the development of heavy vertical lift capabilities proves to be cost-prohibitive, alternatives must be considered (e.g., CH-53K at 18 stons, and Joint Precision Air Drop System – JPADS). If there are no plans for HVL, do not assume it is available in analyses, wargames, and exercises.

Recommendations for Addressing Capability Gaps: Development and Acquisitions

3. UAS Vehicles: The ASB recommends that ASA(ALT) revise UAS Roadmap to expand both near-term and future UAS vehicle options, some of which should be compatible with speed, hover, and range of current and future manned aircraft, with attributes compatible with distributed functionality among UAS (ISR, lethality, …) as informed by the results of system of systems operational effectiveness analyses (Recommendation 1). It should be noted that both the Navy and Air Force have much more mature visions for UAS than the Army.

4. Modernization of Legacy Rotorcraft Systems: The ASB recommends that ASA(ALT) continue S&T and road-mapping efforts for modernizing legacy systems with emphasis on those technologies that are also applicable to future vehicles (e.g., ITEP/FATE engines, DVE capabilities, and greater MUM-T) as informed by the results of system of systems operational effectiveness analyses (Recommendation 1).

910 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

5. Future Vertical Lift Acquisition with Speed and Simplicity: The ASB recommends that ASA(ALT) develop an evolutionary acquisition approach for FVL to allow for earliest possible fielding consistent with funding constraints, as informed by the results of system of systems operational effectiveness analyses (Recommendation 1). The JMR-TD vehicles are close in size and aerodynamic performance capability to the FVL medium class system and industry's substantial investment should be leveraged to get the next-generation rotorcraft in service as soon as possible. It is key that requirements creep be kept to a minimum using successful acquisition examples such as the F-16 program as a guide, i.e., keep the initial designs simple but incorporate modularity for future updates.

6. Aviation Mission Systems: The ASB recommends that AMRDEC/ADD expand mission system technology development, currently focused on DVE, to enable advanced formation concepts in future manned and unmanned platforms, and legacy platforms as appropriate, as informed by the results of system of systems operational effectiveness analyses (Recommendation 1). Needs include additional advanced mission systems (e.g., offensive and defensive DE capabilities) and open systems architectures.

7. Aviation Systems Integration and Testbed: The ASB recommends that RDECOM build the components of an integrated "survivable" system (MUM-T, attritable assets, secure comms, PNT, open operating systems, autonomy, high/low mix, distributed functions across future "formations"). The ASB also recommends that RDECOM, building on Recommendation 1 with relevant content from Recommendations 2-6, develop an aviation integration testbed for experimentation and validation of technology, prototypes, and concepts. Potentially include demonstration (such as JMR-TD), prototype, surrogate, and operational systems.

Recommendations for S&T Portfolio: Innovation and Game Changers

8. Advanced and Disruptive Systems S&T: The ASB recommends that RDECOM, in order to address expanding complex threats and opportunities, develop advanced technologies for an integrated/holistic, manned/unmanned architecture/system to ensure survivability and mission success. The ASB also recommends that ASA(ALT) include in the Army's S&T portfolio leap-ahead technologies (e.g., counter-DE, counter-UAS, advanced materials).

9. S&T Investment Strategy: The ASB recommends that AMRDEC/ADD continue active participation in VAATE and RAMPED engine development. The ASB further recommends that RDECOM explore innovative mechanisms for external collaboration (university, industry, etc.), such as grand challenges (similar to the DARPA construct). Lastly the ASB recommends that ASA(ALT), after exploring leveraging opportunities with other R&D activities, advocate more funding for Aviation S&T.

Summary

In order to overcome the complex threats that Army aviation will face in the future, it is essential to adopt a system of systems approach. As noted above, the team's recommendation to perform

911 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

"System of Systems Operational Effectiveness Analyses" is the most critical of all the recommendations because it informs the remaining recommendations. Recognizing that the technical and operational details will follow from these analyses, the ASB strongly recommends that Army Aviation move away from the current platform-centric approach to focus on the systems of systems approach. Due to the distributed nature of systems of systems approaches, there are compelling advantages to Army Aviation for flexibility, safety, survivability and lethality with significant potential cost advantages.

A complete list of the ASB findings and recommendations is provided in the following table. As already pointed out, all nine recommendations are essential to the future of Army aviation. The first recommendation, to perform system of systems operational analyses must be acted on first because it will provide details to inform the remaining recommendations

912 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

Topic	Findings	Recommendations
Context: Character of War in 2025 and Role of Army Aviation		
1. System of Systems Operational Effectiveness Analyses	Increasing threat sophistication and proliferation (e.g., missiles, UAS, cyber, and directed energy) pose critical concerns. (Classified annex provides additional details) Platform-centric survivability must evolve to a manned-unmanned system-centric approach with new CONOPS and TTPs. A system of systems architecture should include manned-unmanned teaming, supervised autonomous systems, and secure communications.	**TRADOC:** Conduct operational effectiveness analyses of potential system of systems concepts in a cost-constrained environment that address capability gaps for Army aviation in 2025 and beyond in complex threat environments. Concepts should include holistic air-ground approaches, high/low mixes of collaborative manned/ unmanned systems, FVL performance characteristics, higher levels of autonomy, PNT in denied GPS environments, attritable UAS assets and enhanced lethality of DE. Develop CONOPS and architectures for the most cost effective concepts.
2. Affordability of Heavy Vertical Lift	Heavy vertical lift (20-30 stons) is required by the Army CONOPS for expeditionary and operational maneuver, validated by JROC (documented in the FVL and JHL ICDs) and supported by Unified Quest 2014, and "2012 Gaining and Maintaining Access: An Army-Marine Corps Concept." However, development of a new system is cost prohibitive within likely future Army modernization (RDA) funding before 2040. Interim solutions able to provide more limited capability are available (e.g., CH-53K at 18 stons, and Joint Precision Air Drop System – JPADS) and could provide viable options.	**TRADOC:** Assess interim and future HVL options for meeting Army CONOPS and documented JCIDS capability needs for expeditionary and operational maneuver and recommend road ahead • If development of HVL is cost prohibitive, consider alternatives. • If there are no plans for HVL, do not assume it is available in analyses, wargames, and exercises.
Addressing Capability Gaps: Development and Acquisition		
3. UAS Vehicles	The USN/USMC and USAF have strong visions for the expanding role of UAS and manned-unmanned teaming in aviation missions. DARPA, USN/USMC and USAF are investing in next generation UAS technology options that offer potential capability for Army aviation. New UAS are needed to fully exploit manned–unmanned synergy and collaboration of manned systems with supervised autonomous systems within a system-of-systems architecture.	**ASA(ALT):** Revise UAS Roadmap to expand near-term and future UAS vehicle options, some of which should be compatible with speed, hover, and range of current and future manned aircraft, with attributes compatible with distributed functionality among UAS (ISR, Lethality, …) as informed by the results of system of systems operational effectiveness analyses (Recommendation 1)
4. Modernization of Legacy Rotorcraft Systems	Legacy rotorcraft systems (AH-64, CH-47 and UH-60) are expected to remain deployed until at least 2060, requiring modernization investment. Within the current limited budget, Army aviation S&T is investing in technologies that apply to both legacy and future manned systems. These technologies include: ITEP/FATE engine insertion, DVE capabilities, CBM/PHM capabilities, ASE improvements, and greater MUM-T.	**ASA(ALT):** Continue S&T and road-mapping efforts for modernizing legacy systems with emphasis on those technologies that are also applicable to future vehicles, as informed by the results of system of systems operational effectiveness analysis (Recommendation 1).
5. FVL Acquisition with Speed and Simplicity	JMR-TD and FVL provide focus for Army Aviation S&T for next generation rotorcraft systems and provide a solid basis for much needed capability improvements (Ref. FVL ICD); however, there is no funding for FVL in the POM. The JMR-TD vehicles are close in size and aerodynamic performance capability to the FVL medium class system. The current FVL schedule leads to an IOC of the first system in the mid 2030s. It should be beneficial to accelerate this timeline through an evolutionary acquisition approach if funding allows. The JMR-TD, DARPA X planes, USN/USMC prototyping efforts, and industry investment support talent development and retention in rotorcraft government and industry teams.	**ASA(ALT):** Develop an evolutionary acquisition approach for FVL to allow for earliest possible fielding consistent with funding constraints, as informed by the results of system of systems operational effectiveness analyses (Recommendation 1).

913 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

Topic	Findings	Recommendations
6. Aviation Mission Systems	Army S&T mission system programs include Lethality, Survivability, Teaming & Autonomy, Human-System Interface, Avionics, and Networks. RDECOM DVE goals are appropriate and feasible - Progress at AMRDEC, CERDEC, and ARL in sensors, flight control, cueing, computing, and networking. Reduced pilot workload arising from DVE technologies should increase operational mission capacity (e.g., formations with UAS). Advanced sensors (e.g., IR, visible, and hyperspectral) are being developed. Additional advanced mission systems (e.g., offensive and defensive directed energy) and open system architectures are needed. DoD provides singular modeling and wind tunnel capabilities (NASA Ames)	**AMRDEC/ADD:** Expand mission system technology development, currently focused on DVE, to enable advanced formation concepts in future manned and unmanned platforms, and legacy platforms as appropriate, as informed by the results of system of systems operational effectiveness analyses (Recommendation 1)
7. Aviation Systems Integration and Testbed	Concepts developed in Recommendation 1 and new technical capabilities referenced in Sections 2-6 (individually and as integrated systems) will require extensive testing. Some initial work is found in CERDEC I2WD open systems efforts and DARPA's System of Systems Integration, Technology and Experimentation (SoSITE). Fully integrated joint vision for aviation in DoD is not evident. Coalition environment should be considered.	**RDECOM:** Build the components of an integrated "survivable" system (MUM-T, attritable assets, secure comm, PNT, open operating systems, autonomy, high/low mix, distributed functions across future "formations"). **RDECOM:** Building on Recommendation 1 and Sections 2-6, develop an aviation integration testbed for experimentation and validation of technology, prototypes, and concepts. Potentially include demonstration (such as JMR TD), prototype, surrogate, and operational systems.
S&T Portfolio: Innovation and Game Changers		
8. Advanced and Disruptive Systems S&T	Army aviation is at a crossroad of challenge and opportunity. • The challenge: threat sophistication will demand a transformation in the nature of warfare in 2025 and beyond (missiles, UAS, DE, Cyber). • The opportunity: technology is emerging that enables significant improvement in aviation capabilities. Advanced technology solutions are required, including: UAS, autonomy, manned-unmanned collaboration, communications, directed energy, sensors, condition-based and near-zero maintenance technology/concepts, and other discoveries from the S&T enterprise. There is relevant work in other Services, DARPA, and NASA that should be leveraged.	**RDECOM:** To address expanding complex threats and opportunities develop advanced technologies for an integrated/holistic, manned/unmanned architecture/system to ensure survivability and mission success. **ASA(ALT):** Include in S&T portfolio leap-ahead technologies (counter-DE, counter-UAS, advanced materials)
9. S&T Investment Strategy	Based on findings in Sections 1-8, the capabilities of Army Aviation S&T must evolve rapidly (e.g., need to expand UAS and autonomy activity); thus the level of S&T activity must expand beyond the manned aviation S&T portfolio, which is currently well managed. Army S&T investment has led to successful ITEP and FATE engine developments; the transition of these S&T efforts to PORs is essential to both FVL and modernized legacy platforms. Current S&T investment is insufficient to achieve the needed transformation and to maintain overmatch in 2025 and beyond.	**AMRDEC/ADD:** Continue active participation in VAATE and RAMPED engine development. **RDECOM:** Explore innovative mechanisms for external collaboration (university, industry, etc.), such as grand challenges (similar to DARPA construct). **ASA(ALT):** After exploring leveraging opportunities with other R&D activities, advocate more funding for Aviation S&T.

914 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

1 INTRODUCTION

In January 2015, the Secretary of the Army requested the Army Science Board to conduct a comprehensive study of Army Aviation focused on science and technology important to the continuing development of advanced capabilities for Army Aviation assets. The G3/5/7 was identified as the study sponsor. As stated in the Terms of Reference (TOR) for the study, provided in Appendix A, the study objective was "to identify and assess Science and Technology (S&T) enhancements capable of being fielded during the 2025-2040 timeframe that will increase Army Aviation's expeditionary capabilities to support full-spectrum military operations and reduce its sustainment tails and logistics footprint."

The TOR specified three tasks for the study team:

1. Review current Army, Navy/USMC, Air Force, DARPA, OSD, NASA and industry aviation S&T plans, modernization plans and ongoing developments, as well as relevant Force 2025 and Beyond Campaign activities.
2. Address the use of innovative technologies that increase capabilities, overall mission effectiveness, survivability and lethality while reducing sustainment requirements, including logistics footprint and frequency of resupply. Include, but not necessarily be limited to, the following key focus areas for improvement:
    a. Near-zero maintenance platforms and systems,
    b. Exploitation of unmanned aircraft systems,
    c. Meeting the challenges of emerging threats, and
    d. Enhancing the ability to operate worldwide in a variety of stressing and degraded visual conditions.
3. Determine the feasibility and risks associated with each of the findings and recommendations.

This ASB report describes the conduct of the study; discusses Army Aviation challenges, needs, and opportunities; reviews ongoing aviation S&T activities in numerous areas; and provides numerous findings and recommendations important to enhancing future Army Aviation capabilities. A comprehensive briefing describing the study in detail was completed and approved by a vote of all members of the ASB in July 2015. A summary briefing of study findings and recommendations was presented to the Secretary of the Army, the Chief of Staff of the Army, and other senior Army officials in October 2015.

1.1 Study Team, Visits, and Literature Survey

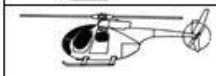
The study team established to address these tasks, identified in Appendix B, included ASB members with significant technical expertise and experience in a wide range of disciplines:

- Physics
- Materials science
- Energy
- Fluid dynamics
- Technology transition
- Signal processing
- Robotics
- Electronics

915 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

- Aerospace engineering
- Electrical engineering
- Mechanical engineering
- Nuclear engineering
- Strategic planning
- Systems engineering and integration
- R&D management
- Directed energy weapons
- Command and control
- Optical communications
- Armor/anti-armor technology
- Helicopter systems
- Weapons systems
- Military aviation operations

To obtain the comprehensive and detailed information required to address the specified tasks, members of the study team made over 30 visits to Army and other organizations actively involved in the development of advanced capabilities pertinent to Army Aviation. These organizations are listed below:



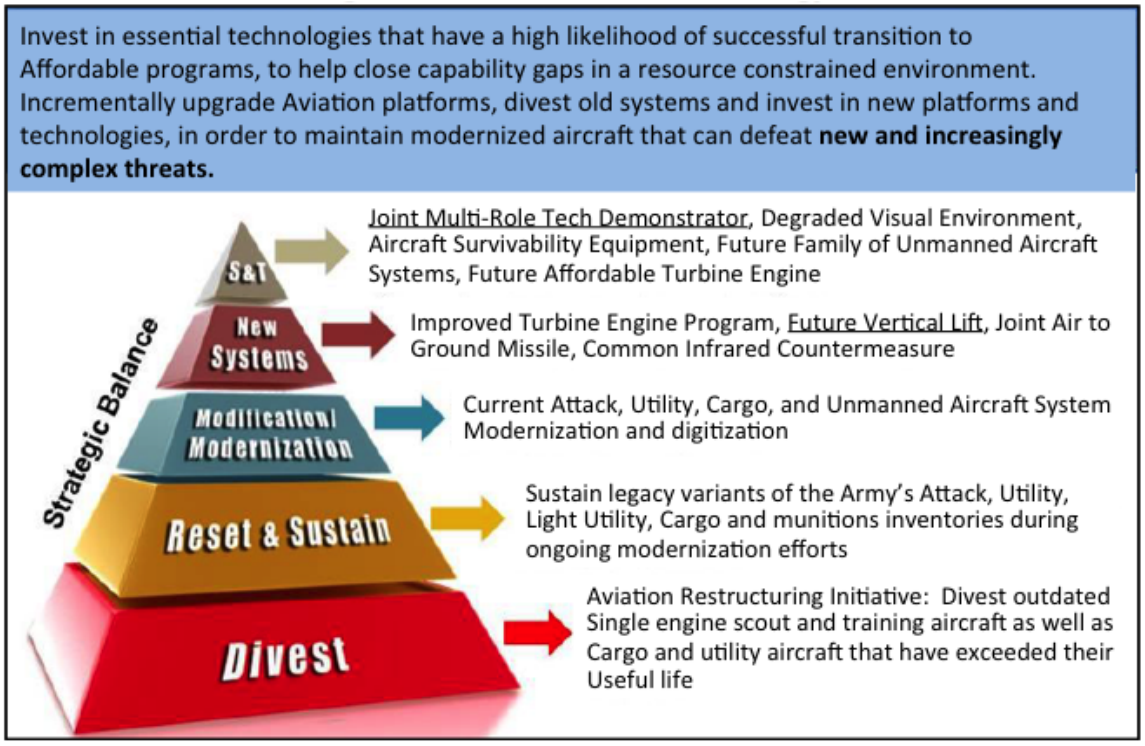
- Army
  - Aviation and Missile Research Development and Engineering Center (AMRDEC)
    - Aviation Development Directorate (ADD)
    - Weapons Development and Integration Directorate (WDI)
  - PEO Aviation and Program Managers (AS, CH, UH, AAH, ASH, NSRWA, FW, UAS)
  - US Army Aviation Center of Excellence (USAACE)
  - US Army Aeromedical Research Laboratory (USAARL)
  - Combat Readiness/Safety Center
  - TRADOC Capability Managers (UAS, Lift)
  - Communications Electronics Research Development and Engineering Center (CERDEC)
    - Night Vision & Electronic Sensors Directorate (NVESD)
    - Intelligence and Information Warfare Directorate (I2WD)
  - Army Research Laboratory (ARL)
  - Army Special Operations Aviation (ARSOA)
  - Operational Support Airlift Agency (OSAA)
  - Vertical Lift Research Center of Excellence (Georgia Tech)
- Other Services
  - Navy – Naval Air Systems Command (NAVAIR)
  - Air Force – Air Force Research Laboratory (AFRL)
- Joint/DoD
  - Future Vertical Lift IPTs
  - Defense Advanced Research Projects Agency (DARPA)
- Other
  - NASA Headquarters
  - NASA Langley Research Center
  - NASA Ames Research Center
  - Army Aviation Association of America (Quad-A)
  - Vertical Lift Consortium
  - Industry organizations

916 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

Lines of inquiry associated with these visits are summarized in Appendix C. Information and observations responsive to Task 1 are provided in Appendices D, E, F, G, H, and I. Study findings, observations, and recommendations associated with Tasks 2 and 3 are presented in Sections 3 and 4 below. Appendix J provides the final briefing presented in July 2015. Appendix K provides a list of acronyms and abbreviations used in this report. Numerous documents collected and reviewed in conducting the study are cited in the Bibliography in Appendix L.

1.2 Current Army Aviation Platforms

The Army currently employs the six rotary wing aircraft, as described in Figure 1-1. The Little Bird (also called the "Killer Egg") is used only by SOCOM. The Kiowa observation helicopter is being retired. The Lakota is only approved for use in CONUS, where it is used as a trainer. The remaining three aircraft, the Chinook, Black Hawk, and Apache, form the core of Army Aviation. Note that these platforms were designed more than 30 years ago and are expected to remain in the fleet through 2060.



Army Legacy Rotorcraft	Name / Designator	Role	IOC/ Retire?	Status	Max Takeoff	Max Load	Cruise Speed/ Range	Developer (inventory)
	Chinook CH-47D/F	Cargo	1962 / 2060	Block II available in 2020	50,000 lb	28,000 lb	130 kt / 400 nm	Boeing (503)
	Black Hawk UH-60	Utility	1979 / 2060	Upgrades + ARI transfer*	23,500 lb	2,640 lb int, 9,000 lb ext	159 kt / 640 nm	Sikorsky (1,565)
	Apache AH-64	Attack	1986 / 2060	Upgrades + ARI transfer*	23,000 lb		143 kt / 257 nm	Boeing (756)
	Lakota UH-72	Trainer, CONUS only	2007 / ???	ARI use for training	7,900 lb	3,950 lb	133 kt / 370 nm	Eurocopter (307)
	Kiowa OH-58D	Observa-tion	1969 / soon	ARI retire*	5,500 lb	1,700 lb	110 kt / 140 nm	Bell (618)
	Little Bird A/MH-6	SOF	1980 / ???		3,100 lb	1,500 lb (6 pax)	135 kt / 232 nm	McDonnell Douglas / Boeing (47)

* ARI – Aviation Restructuring Initiative

Figure 1-1 Army Legacy Rotorcraft

Figure 1-2 illustrates the Army Aviation Modernization Strategy. S&T efforts sit at the top of the pyramid; they include the Joint Multi-Role Technology Demonstration (JMR-TD) and Degraded Visual Environment (DVE) activities, which are the largest Army Aviation S&T efforts. As Army Aviation S&T efforts mature over time, emerging advances are incorporated into new systems, such as JMR-TD technologies that will inform the Future Vertical Lift (FVL) program. Other new systems, such as the Improved Turbine Engine Program (ITEP) engines, are part of the modernization of select legacy systems. Still other emerging technologies support sustainment of legacy systems. Finally, at the base of the pyramid outdated systems are divested.

917 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

Source: Army Equipment Modernization Strategy, March 2015 (Annex E – Aviation) - G8

Figure 1-2. Army Aviation Modernization Strategy

The Aviation Restructuring Initiative (ARI) is a five-year plan to reduce Army Aviation costs while addressing fleet obsolescence and sustainment issues. It was approved by the CSA in December 2013, with the first execution order issued in April 2014. The ARI calls for the Army to:

- Cut three of the 13 active-duty combat aviation brigades; Army Reserve component would retain 12 aviation brigades – 10 in the National Guard and two in the Army Reserve.
- Retire OH-58 Kiowa Warriors and TH-67 trainers (both single-engine aircraft).
- Use Apache to fill Kiowa's reconnaissance and scout role.
- Replace TH-67 training helicopters with dual-engine LUH-72 Lakotas.
- Move Apaches from the Guard to active Army and, in turn, provide the Guard with UH-60 Black Hawks. This plan has been controversial for the Guard.
- Have 20 Apache battalions in active components.

The National Guard has proposed retaining more crews and units, but some units would only be partially equipped. Cost Assessment and Program Evaluation (CAPE) analysis indicates that the Army plan is not sized for prolonged stability operations. The National Guard alternative costs $89M to $176M annually plus a one-time cost difference of approximately $500M. Congress postponed the transfer of Apaches until FY2016 and established a National Commission on the Future of the US Army that will conduct two studies: (1) the structure of the Army and policy

918 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

assumptions related to the size and force mixture of the Army, and (2) transfer of Apaches from the Guard to the active Army. The ARI will not be discussed further in this report.

The Army also has a fleet of over 339 fixed wing aircraft, all commercial derivative aircraft. The fleet includes three categories of aircraft:

- Special Electronic Mission Aircraft (SEMA):
  - EO-5 Dash 7, RC-12 Huron (Guardrail), B-300 Beechcraft
- Transport Aircraft:
  - Warfighting Combatant Commanders: C-12 Beechcraft, C-26 Metroliner, UC-35 Cessna
  - Executive Transport: C-20 Gulfstream, C-37 Gulfstream
- Mission Support Aircraft:
  - RDT&E: C-208, T-34
  - USMA Flight Laboratory: CE-182
  - Golden Knights Parachute Team: UV-18 Twin Otter, C-31

In addition to its rotary wing and fixed wing aircraft, Army Aviation also employs four unmanned aircraft systems (UAS), described in Figure 1-3. Raven and Puma are both small hand-launched UAS used for ISR missions. The Shadow is a larger UAS, also used for ISR missions. Gray Eagle is a much larger UAS that can carry Hellfire missiles as well as an ISR pod. Only Shadow and Gray Eagle can be controlled by manned aircraft (Apache AH-64E) in Manned-Unmanned Teaming (MUM-T) operations.

Legacy Army UAS	Name / Designator	Role	IOC	Payload	Max Takeoff	Cruise Speed/ Endurance	Developer (# built)
	Raven RQ-11A/B	Small UAV, Hand launch	1999	ISR	4 lb	30 kt / 1-1.5 hrs	AeroVironment (19,000+)
	Puma RQ-20A		2007	ISR	13.5 lb	45 kt max / 2 hrs	AeroVironment (1,000+)
	Shadow RQ-7A/B	Short Range Tactical	2002	ISR	375 lb	70 kt / 9 hrs	AAI Corp (~500+)
	Gray Eagle MQ-1C	Predator Upgrade	2009	ISR pod / Hellfire	3,600 lb	150 kt max/ 30 hrs	General Atomics (~100)

2 ARMY AVIATION CHALLENGES, CAPABILITY NEEDS AND SYSTEM CONCEPTS

2.1 Challenges Facing Army Aviation

Army Aviation is facing multiple challenges that require new ways of thinking regarding the character of Joint warfare in 2025 and beyond, as well as how Army Aviation should be employed to be most effective in the integrated Joint battlespace of the future.

2.1.1 Survivability

Among the most pressing of these challenges is the growth and proliferation of advanced threats that place Army Aviation assets at high risk. The Capstone Concept for Joint Operations: Joint Force 2020[1] highlights the issue of the proliferation of sophisticated threats and the need for new Concepts of Operation (CONOPS) for countering the threats and maintaining overmatch:

> "Our nation and Armed Forces are transitioning from a decade of war to a future that presents us with a security paradox. While the world is trending toward greater stability overall, ***destructive technologies are available to a wider and more disparate range of adversaries***. As a result, the world is potentially more dangerous than ever before. ***New concepts of operation are needed*** to address the security paradox we face."
>
> "The diffusion of advanced technology in the global economy means that middleweight militaries and non-state actors can now muster weaponry once available only to superpowers. The ***proliferation*** of cyber and space weapons, precision munitions, ballistic missiles, and anti-access and area denial capabilities ***will grant more adversaries the ability to inflict devastating losses***. These threats place our access to the global commons at risk, target our forces as they deploy to the operational area, and can even threaten forces at their points of origin. Meanwhile, adversaries continue to explore asymmetric ways to employ both crude and advanced technology to exploit U.S. vulnerabilities. Consequently, the capability advantage that U.S. forces have had over many potential adversaries may narrow in the future. Adversaries will not only have more advanced capabilities in every domain. More of them will have the ability to simultaneously fight across multiple domains."

Figure 2-1 illustrates some of the threats facing Army Aviation today and in future conflicts. These threats span the spectrum from sophisticated next-generation air defenses to capabilities that utilize widely available inexpensive assets, such as swarms of small Unmanned Aircraft Systems (UAS), which can be easily procured through commercial outlets. Currently, the most worrisome threat is posed by man-portable air defense systems (MANPADS) such as the systems shown in Figure 2-2. Some of these threats are discussed in a classified annex to this report.

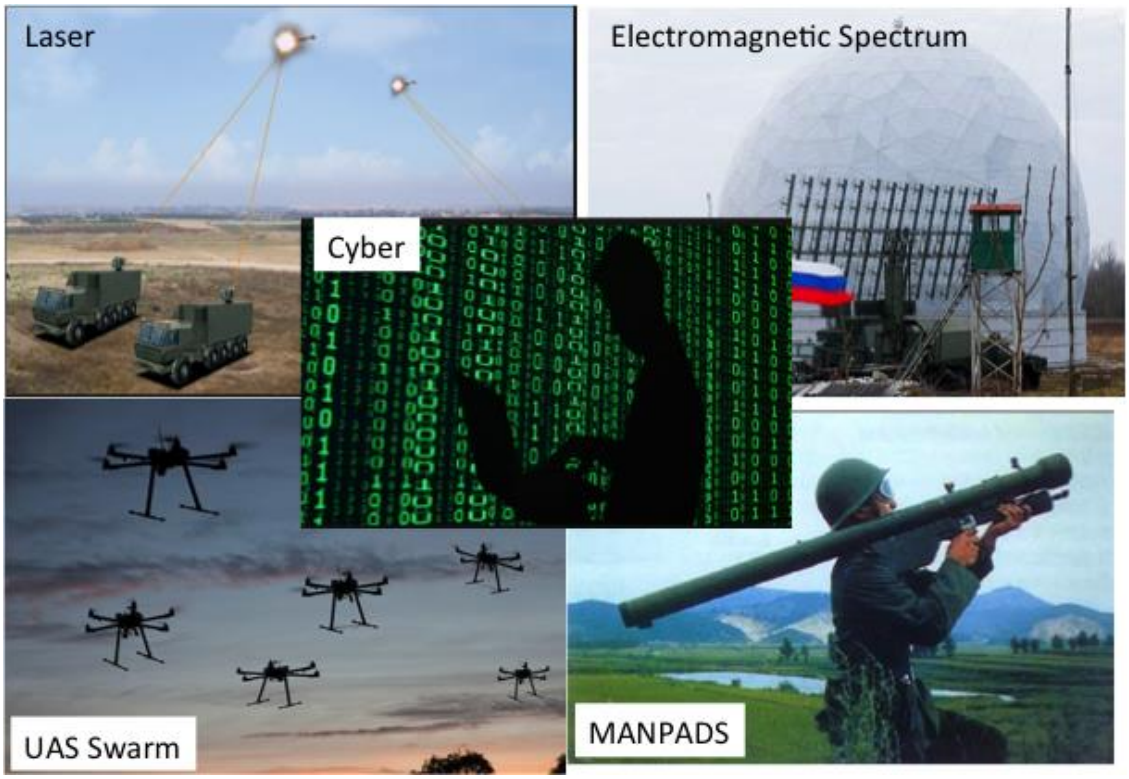

Figure 2-1. Complex Threats and Opportunities

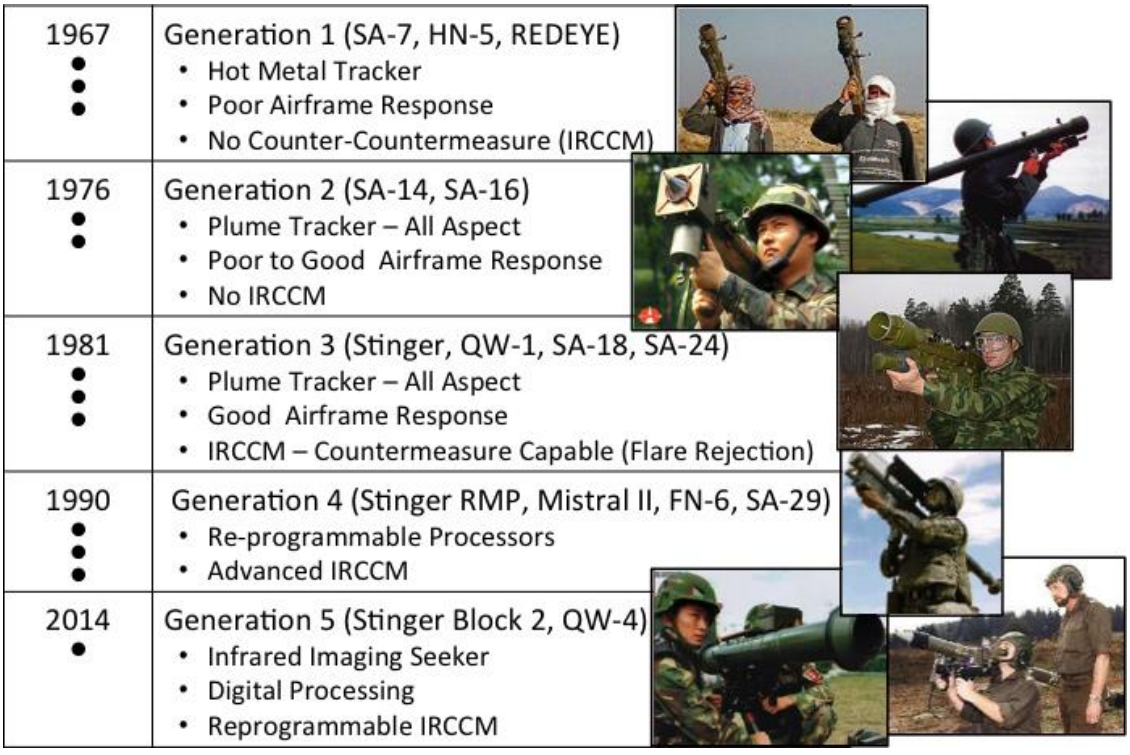

Figure 2-2. Generations of IR MANPADS

921 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

2.1.2 Vertical Lift for Expeditionary and Operational Maneuver

A second pressing challenge is the inability of current Army Aviation systems to satisfy the need for strategic, expeditionary, and operational maneuver of dispersed mechanized forces in austere areas of operation in the face of capable anti-access and area denial (A2/AD) threats in future conflicts. The recently released Army Operating Concept[2] highlights the need for operational maneuver and sustainment to point-of-need for dispersed forces:

- Respond Globally: "When called upon, globally responsive combined arms teams ***maneuver from multiple locations*** and domains to present multiple dilemmas to the enemy,..."
- Conduct Joint Combined Arms Operations: "Joint combined arms operations create multiple dilemmas for the enemy. Army forces ***achieve surprise*** through ***maneuver across strategic distances,*** and arrival at unexpected locations. Army forces have the mobility, protection, and firepower necessary to strike the enemy from unexpected directions. In high ***anti-access and area denial*** environments, ***dispersion*** allows future army forces to evade enemy attacks, deceive the enemy, and achieve surprise."
- Sustain High Tempo Operations: "Army sustainment units integrate efforts with the Joint Force to ensure unimpeded sustainment flows across the land, air, and maritime domains. These units provide supplies and services to the ***point of need..***."

The burden on Army vertical lift assets for providing supplies on the battlefield was increased as a consequence of the decision to retire the C-23 Sherpa cargo plane and transfer the fixed-wing supply mission to the Air Force. Army commanders who need small quantities of supplies must either wait until there is an available, scheduled AF C-130 or send a rotary wing vehicle to transport the material. This has led to increased workloads (and hence increased maintenance) for rotary wing aircraft.

Current Army Aviation assets cannot provide the heavy vertical lift (20-30 stons; see section 2.2) needed for expeditionary and operational maneuver of ***mechanized*** dispersed forces. This need was detailed in the 2014 Army Unified Quest exercises,[3] the 2014 ASB study on Strategic and Expeditionary Maneuver,[4] and the 2012 Army-Marine Corp Concept:[5]

- ***Unified Quest 2014***: "Self-deployable Army future vertical lift capabilities and joint shallow draft systems must be capability development options. These efforts are essential to future strategic, operational, and tactical maneuver and enable dispersed forces to maintain mutually supporting functions."

---

922 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

- ***2014 ASB study on Decisive Army Strategic and Expeditionary Maneuver***: "Vertical lift is an essential enabler for synchronized distributed interdependent maneuver via unpredictable entry points."
- **2012 Gaining and Maintaining Access: An Army-Marine Corps Concept**: "Vertical maneuver of *mounted* forces provides the means to rapidly gain positional advantage over the enemy creating and magnifying the effects of surprise."

The challenge for the Army is the lack of funding necessary to develop and procure a heavy vertical lift system to satisfy these needs. Army Aviation funding is discussed in Section 2.1.5.

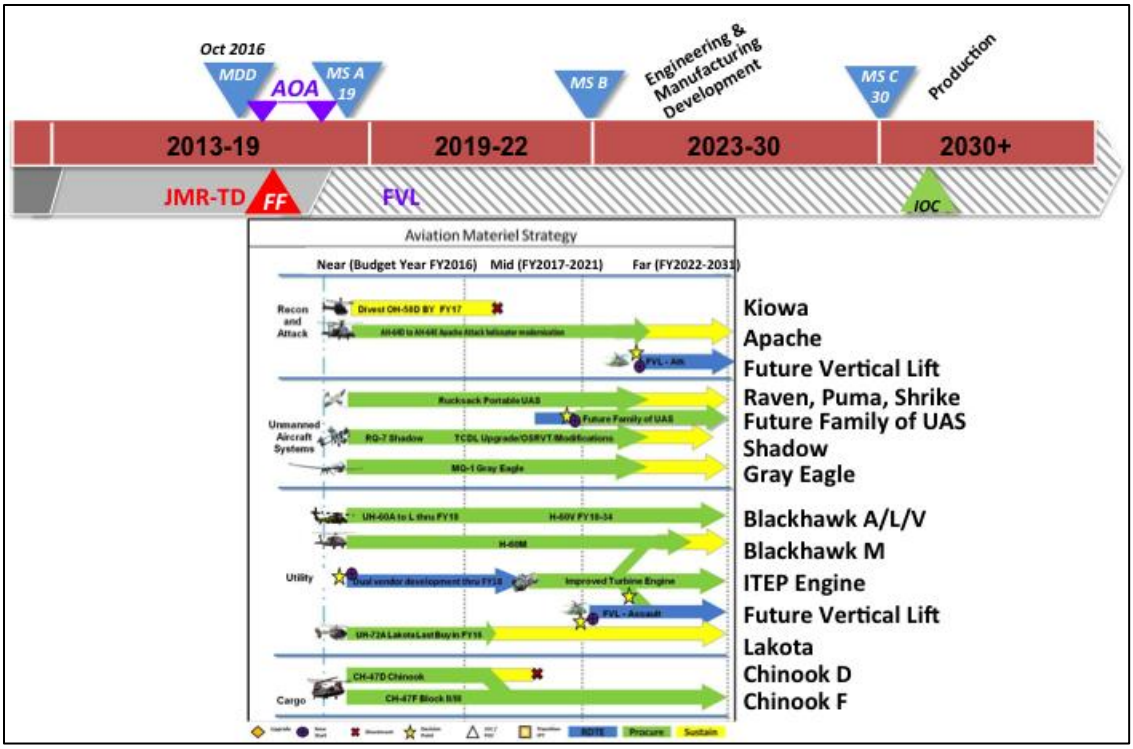
2.1.3 Aging Legacy Rotorcraft Systems and Future Vertical Lift

Army Aviation is continually faced with the challenge of trying to achieve an optimal balance of its R&D investments committed to modernizing/upgrading legacy rotorcraft platforms and to developing new systems that offer expanded performance capabilities and reduced sustainment compared to current systems. This balancing challenge is exasperated by the limited funding allocated to aviation efforts within the Army S&T portfolio (see section 2.1.5).

The Future Vertical Lift (FVL) Family of Systems (FoS) represents the future of Army Aviation manned (and optionally manned) rotorcraft systems. FVL is currently an initiative within the Army Aviation S&T portfolio and is not expected to become a Program of Record (POR) until after the current Program Objective Memorandum (POM). Therefore, if the program were to follow normal DoD acquisition processes for an ACAT I Major Acquisition Program and the Planning, Programming, Budgeting and Execution (PPBE) processes, an Initial Operating Capability (IOC) for FVL would not be expected until the mid-2030s. Once IOC has been achieved, at historical Army Aviation procurement funding levels it will take roughly 30-40 years to replace the legacy platforms.

It is expected, therefore, that legacy rotorcraft systems (AH-64, CH-47 and UH-60), which are all 1960-1970 vintage designs, will remain deployed until at least 2060. This century-long platform life would be rivaled only by the B-52 bomber, which has been re-purposed from its original mission to extend its utility. The noted Army rotorcraft platforms have undergone several upgrades over their lifetimes. At least one more major upgrade to these systems, however, will be required beyond those currently in progress or funded within the POM for them to remain operationally effective against evolving threats, as reflected in the FVL first aircraft timeline shown in Figure 2-3. Fortunately, several significant technology initiatives within the Army Aviation S&T portfolio apply to both legacy and future manned systems. These technologies include ITEP/FATE engine insertion, DVE capabilities, CBM/PHM capabilities, ASE improvements, and greater MUM-T.

923 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING



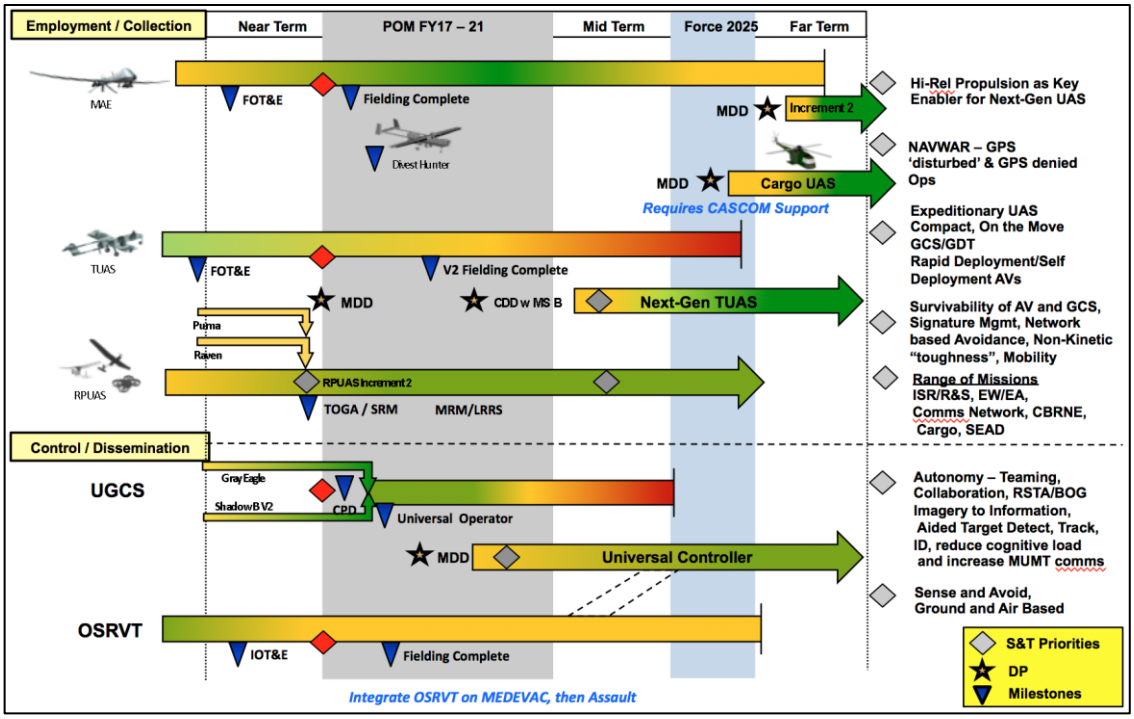


Figure 2-3. FVL – First Aircraft Timeline

2.1.4 Unmanned Aircraft Systems (UAS) and Manned-Unmanned Teaming (MUM-T)

Current Army Aviation UAS assets consist of the Raven, Puma, Shadow, and Gray Eagle systems. These systems are all fixed-wing, have limited autonomy and limited MUM-T capability, and are essentially dedicated to a single mission (ISR, although Gray Eagle can carry Hellfire missiles in addition to ISR payloads). Currently, the AH-64E has the capability to control the Shadow and Gray Eagle flight path and payload (but not takeoff or landing). Although the Army UAS Roadmap[6] cites plans to upgrade these platforms and eventually to develop replacements for some of them (see Figure 2-4), it lacks a clear vision for expanding the use of UAS as complements and extensions to manned aviation, rather than simply as ISR systems. Expanding the mission set and increasing autonomy for UAS are identified as far-term objectives in the roadmap, but very limited funding is currently allocated to achieving these objectives. Army S&T programs to advance manned-unmanned collaboration and UAS autonomy are discussed in Section 3.3.

[6] US Army UAS Center of Excellence, "*Eyes of the Army," U.S. Army Unmanned Aircraft Systems Roadmap 2010-2035*, 2010, http://www-rucker.army.mil/usaace/uas/us%20army%20uas%20roadmap%202010%202035.pdf .

924 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

Source: UAS S&T Priorities Briefing by PM-UAS 30 Mar 2015

Figure 2-4. UAS S&T Priorities

In contrast to the Army Aviation UAS roadmap, the USAF and USN/USMC have bold visions for expanded roles/missions for UAS and greater use of collaborative MUM-T, as reflected in Figure 2-5. In the center of the USN "Sea Based Aviation" document cover page are three UAS systems: the Unmanned Carrier Launch Airborne Surveillance and Strike System (UCLASS) in the middle, the MQ-8 Fire Scout unmanned helicopter to the left of UCLASS and the RQ-21 version of the Scan Eagle UAS to the right. The UCLASS is intended to perform deep strike missions currently conducted by manned fighter/attack aircraft. The Secretary of the Navy has indicated that the F-35C should be the USN's last manned fighter jet. The RQ-21 is a modular design that allows a wide variety of mission payloads, providing multi-mission flexibility. Among the payloads either deployed or in development are SIGINT, EW, Communications Relay, SAR/GMTI, real-time targeting and wide-area persistent surveillance. The USAF illustrates the Unmanned Combat Air Vehicle (UCAV) flying in close formation with the F-22, providing "wingman" capabilities utilizing autonomous operations under supervised control of the manned fighter.

925 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

Figure 2-5. The Navy and Air Force Have Visions for UAS

The need for similar unmanned capabilities within Army Aviation was highlighted by Unified Quest 2014,[7] which evaluated the key roles that UAS can and should play in the future Army integrated battlespace:

> **"Unmanned** air and ground platforms that enhance soldier decision-making and action with self-planning, self-navigation, and mission execution capabilities will have significant potential to change the future battlefield. ***The Army must develop concepts of employment for future autonomous and unmanned systems in the near-term to integrate them efficiently into the force in the far-term (2030-2040)."***

The rapidly advancing technologies associated with UAS, autonomous systems, and MUM-T should be viewed as a significant opportunity for Army Aviation to better integrate collaborative manned-unmanned capabilities into its future force. However, a major challenge in expanding the Army Aviation UAS portfolio, increasing MUM-T capabilities, and meeting this UQ vision is the small percentage of Army S&T funding allocated to UAS (see Section 2.1.5).

926 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

2.1.5 Army Aviation Funding

Army Aviation must somehow meet all of the challenges detailed above within an S&T budget that is only about 8% of Army S&T funding (Figure 2-6). The lack of a robust budget is perhaps its most significant challenge that is outside of the Army Aviation community control.

The Army is the lead Service for DoD rotorcraft systems and technologies. The other Services are dependent on a robust Army Aviation S&T program. The Army should, of course, leverage technology developments by the other Services, NASA, and DARPA, as well as commercial industry initiatives. NASA rotorcraft spending, however, is down to $20M in FY2016, and DARPA investments in rotorcraft technology developments, while currently robust, are variable.

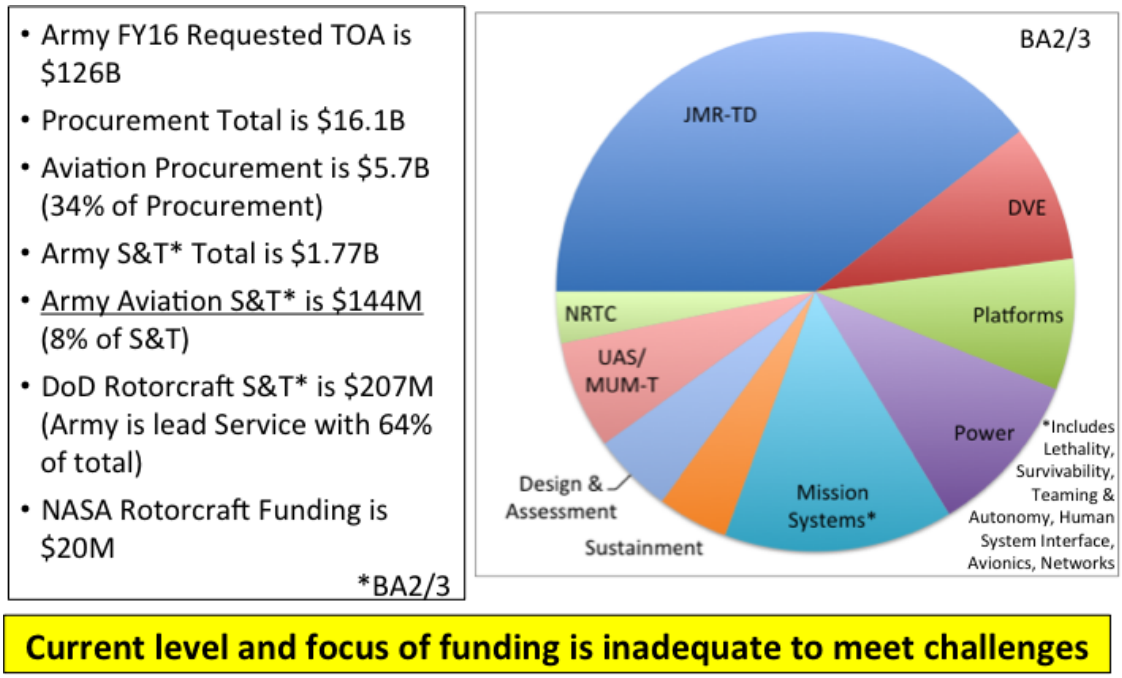

Figure 2-6. Meeting Future Challenges Demands a Robust Aviation Portfolio

Within the Army Aviation S&T budget, a healthy portion is devoted to the JMR-TD program, which provides the validation of aerodynamic and aeromechanics technologies for FVL. This Army investment is more than matched by industry participants in the program. The two JMR demonstrator aircraft are sized to match the medium class FVL, which will ultimately replace the AH-64 and UH-60 legacy systems. There is little current investment, however, to support an ultra-heavy class of vehicle that would satisfy the heavy vertical lift capabilities required for maneuver of mechanized dispersed forces. Also, and particularly vexing, is the small allocation of Army Aviation S&T to UAS and MUM-T. It is difficult to imagine how Army Aviation will satisfy its challenges and validated capability needs (discussed in Section 2.2) within these budget constraints.

927 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

2.2 Army Aviation Capability Needs and Gaps

The Army Aviation capability needs and gaps to meet these challenges are well documented in JROC-validated Capability Based Assessments (CBAs) and Initial Capability Documents (ICDs) developed through the JCIDS process (Figure 2-7).

- System/Platform
  - Future Vertical Lift (FVL) CBA, 21 Jun 10
  - FVL Family of Systems (FoS) ICD, 8 Apr 13
  - Joint Future Vertical Lift (JFVL) ICD, Oct 09
  - Joint Heavy Lift (JHL) ICD, 12 Oct 07
  - Unmanned Systems ICD, 14 May 10
- Aircraft Survivability
  - Aircraft Survivability CBA, 6 Jan 09
  - Degraded Visual Environment CBA, 21 Jul 09
  - Aircraft Survivability ICD, 6 Oct 11

Figure 2-7. Army Aviation Capability Needs & Gaps Emanate from Validated JCIDs Documents

The capability needs and gaps for FVL are documented in the JROC approved FVL FoS CBA and ICD. Capability objectives in the FVL ICD document gaps associated with many of the challenges discussed previously in Section 2.1:

- **Operational and Tactical Vertical Movement:** The future force requires VTOL Aviation to support the operational and tactical movement of forces to achieve a position of advantage with respect to enemy forces. Vertical movement requires aerial delivery and airborne operations to move supplies, and insert/extract personnel and equipment across the range of military operations.
- **Destroy, Neutralize or Suppress Enemy Targets:** FVL should employ a variety of future and legacy weapons systems against a wide array of existing and emerging threats.
- **Air Reconnaissance, Surveillance and Target Acquisition:** Future systems should conduct the full range of intelligence, reconnaissance, surveillance and target acquisition missions. FVL FoS platforms will maintain surveillance of areas to detect, identify, prioritize and designate targets; increase responsiveness; and exploit the capabilities of interoperability between manned and unmanned systems.
- **Execute Network-Enabled Command, Control and Reporting:** FVL platforms should execute network-enabled C2 and reporting for SA, fires, JF integration and collaboration.
- **Aviation Sustainment, Maintenance and Supply Activities:** Future systems should increase platform availability, reliability, sustainability, maintainability, energy efficiency / reduced fuel consumption and logistics footprint.
- **Safety and Survivability of Aircraft and Personnel:** Protect the aircraft, aircrew and passengers departing controlled flight, from impacting hazards, effects of enemy

928 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

weapons, and onboard aircraft fire or crash damage. Safety shall not be compromised by Hazards of Electromagnetic Radiation to ordnance, fuel, personnel, EMI, or ESD.

The FVL ICD translated these capability needs into performance objectives for three classes of vehicles: Light, Medium and Heavy (see Figure 2-8). As indicated, among the key performance objectives is higher speed than conventional helicopters can achieve, which drives the aircraft configuration choices to compound/hybrid or tilt-rotor concepts. JMR-TD is developing and testing demonstrators for these advanced concepts. The distinguishing feature between the FVL classes is payload, with the light configured to carry a SOCOM team (6 passengers), the medium to carry a squad (12-24 passengers) and the heavy a platoon (33-53 passengers).

Capability	**Performance Goal***	**Performance Value**
Worldwide Performance	Operate 90+% in Critical Regions	HOGE at 6 kft and 95°F
Combat Radius	Operate Across Army Division AO	424 km
Cruise Speed	Transit Army Division AO Within 1 Hour	170 – 300 kts
Internal Payload	L: 6 Passengers M: Squad and up to 20K H: Equivalent to USMC CH-53K	L: 2.5K+ lbs M: 5K – 20K lbs H: 20K – 30K lbs
External Performance	L: Equal to Internal M: M777 Howitzer and JLTV H: Equivalent to USMC CH-53K	L: 2.5K+ lbs M: 13K – 23K H: 30K
Passengers	L: SOCOM Team M: Squad H: Platoon	L: 6 M: 13 – 24 H: 33 – 53
Self Deployment	Transit Longest Leg of Pacific	3889 km

* L – Light, M – Medium, H - Heavy

Figure 2-8. FVL ICD Performance Objectives

A fourth class of vehicle that is discussed in the FVL ICD is the ultra-heavy class, which is capable of moving mechanized forces, including medium-weight armored vehicles. The capability needs for this class are documented in the Joint Future Vertical Lift (JFVL) ICD as well as in the Joint Heavy Lift (JHL) ICD. The capability needs in the JFVL ICD address the challenge of strategic and operational maneuver of dispersed mechanized forces in austere areas of operation:

- Transport forces over strategic and operational distances to points of need/effect bypassing traditional PODs;
- Conduct precision air delivery of supplies over strategic and operational distances with required velocity;
- Operate into austere, short, unimproved landing areas with limited infrastructure;
- Perform operational maneuver with medium weight armored vehicles and personnel;

929 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

- Reposition medium weight armored vehicles and personnel by airlift;
- Minimize RSOI.

Critical capability needs for the Joint Future Vertical Lift system include a payload capability of 20-36 stons, the ability to self-deploy from CONUS to theatre, a mission radius with payload of 250-1000 nm, and a speed that allows for in-flight refueling.

The Aircraft Survivability ICD combines the aircraft survivability CBA with the Degraded Visual Environment (DVE) CBA. It addresses, therefore, both the need for survivability over the full spectrum of conflict against capable threats and the need for aviation assets to conduct operations in degraded visual environments. Requirements extracted from the ICD include:

- The future modular force will leverage aviation that is capable of deploying worldwide to conduct full spectrum operations and survive against lethal threats in a wide variety of physical environments and weather conditions that severely degrade pilot visibility.
- Survivable aviation assets will enable joint forces to conduct operational maneuver from strategic distances; deploy through multiple, unimproved points of entry, forcibly if necessary; and overwhelm hostile anti-access capabilities to rapidly bring and apply combat power to the enemy.
- These units will arrive in the AO with the ability to conduct immediate, simultaneous, distributed and continuous combined arms operations throughout the operational environment.

2.3 System Concepts to Meet the Challenges and Satisfy the Capability Needs

The challenges and capability needs for Army Aviation tend to group into three categories:

1. Survivability of aviation assets against proliferated capable threats,
2. Reliance on 1970 vintage legacy platforms beyond 2025-2040 until the advanced performance capabilities of FVL can be fully deployed, and
3. Vertical maneuver of dispersed mechanized forces required to implement the Army CONOPS.

Moreover, it is imperative to address these challenges within a budget-constrained environment and a relatively meager allocation of Army S&T funds to Army Aviation. System concepts and/or affordable solutions are required for each of these challenges to provide focus for Army Aviation S&T investments.

With respect to the first category, the current approach to survivability of Army Aviation systems is based on a traditional multi-layered approach centered on the platform, depicted in Figure 2-9 . The outer layer involves systems and techniques to avoid detection by a threat system, the next layer to avoid engagement by the threat, and so on. ROSAS, cited in the figure, is an AMRDEC Route Optimization for Survivability Against Sensors effort that seeks to demonstrate a real-time route planning system to avoid pop-up threats; it is intended to provide new capabilities for several of the protection layers. This layered “onion” approach has served well in the past. Next-generation threats and their proliferation, however, call into question how much longer this

930 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

platform-centric approach can remain effective. On the one hand, it is not clear that the layering will provide adequate survivability against the advanced threats. Further, this platform-centric approach requires that all of the functionality of the "onion" (including threat detection and warning systems, countermeasure systems, signature management systems, active and passive protection systems, etc.) be integrated into a single platform. This approach results in a very high cost asset, which produces a very low ratio of threat kill cost to blue force loss cost. This cost ratio may place onerous limitations on the blue force commander on how and when to deploy aviation assets.

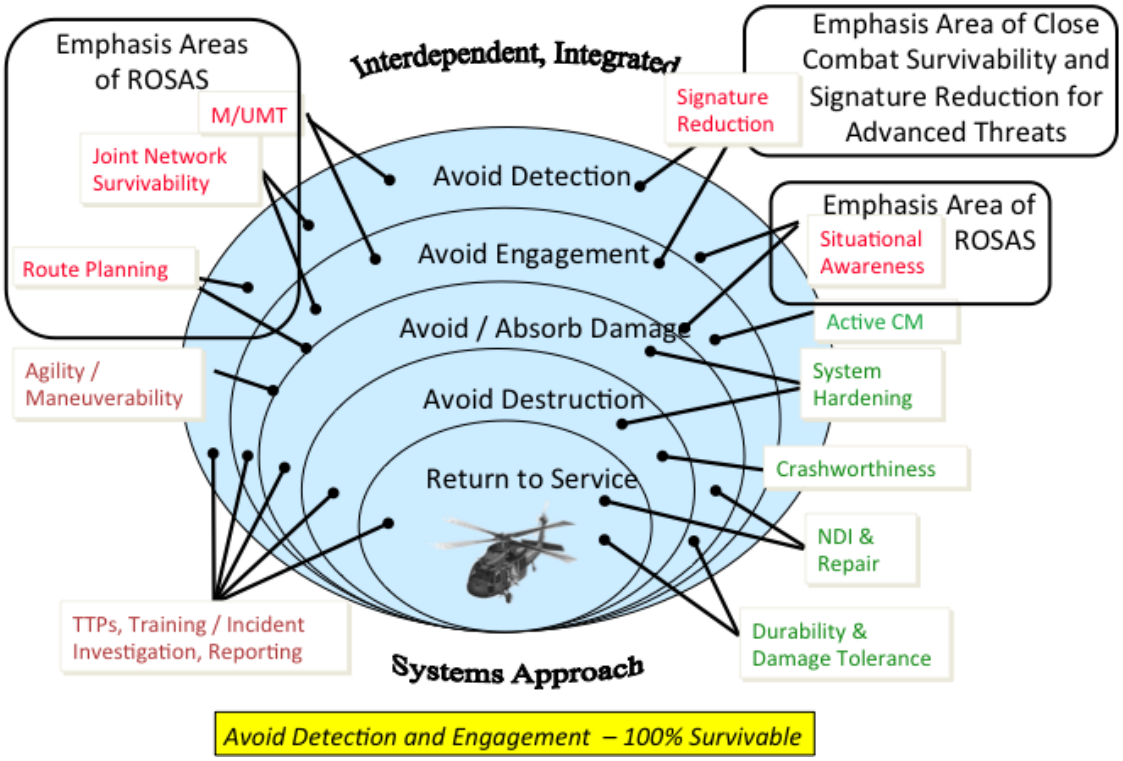

Figure 2-9 AMRDEC Total Survivability Paradigm – Platform-Centric

One approach to solving this platform-centric dilemma involves a system-of-systems (SoS) concept, which effectively adds another layer to the "onion" outside the platform itself, as illustrated in Figure 2-10. A limited number of elements of the SoS concept are already being implemented by means of the fusion of off-board information with on-board data and the recent upgrade of AH-64 to include Level 4 MUM-T capability with Shadow. However, a more robust vision for the future that takes fuller advantage of collaboration between manned and unmanned systems (similar to the USAF and USN/USMC visions illustrated earlier in Figure 2-5) is required to drive SoS solutions that fully exploit the synergy of unmanned systems operating in collaboration with the manned platform at the center of the "onion." Supervised semi-autonomous UAS can provide another layer important to survivability.

931 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

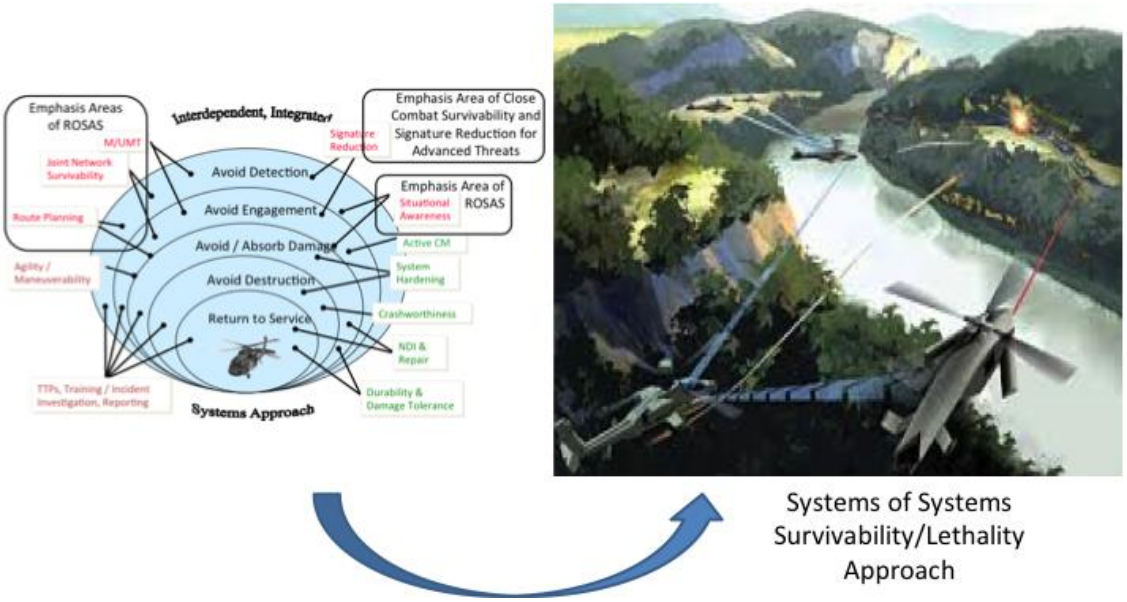

Figure 2-10 Total Survivability from a System-of-Systems Perspective

A top-level SoS concept for this outer layer of the "onion" is illustrated in Figure 2-11. In this concept, the manned aircraft serves as the mission supervisor, but much of the functionality to prosecute the mission is distributed onto UAS systems, which operate autonomously unless directed by the mission supervisor. Distributing the functionality improves mission and survivability and effectiveness in two ways. First, it greatly complicates threat response and adds a layer around the manned asset that the threat must defeat. Secondly, it reduces the cost of the manned asset, thereby reducing the ratio of cost of potential blue force asset loss to threat cost. This concept is discussed in more detail in Section 4.3. The UAS cost must, of course, be added to the overall blue force formation cost. However, in many cases the UAS may be of sufficiently low cost to be considered to be "attritable."

The second challenge category involves reliance on aging legacy rotorcraft systems until the Army can afford to make FVL a POR, develop the FVL aircraft, conduct OT&E, and gradually retire the earlier models as FVL variants are procured. As discussed previously, the current FVL schedule, which is driven by funding constraints as well as technology maturation, does not lead to an IOC of the *first FVL variant* (most likely the FVL-Medium replacement for either the AH-64 or UH-60) until the mid-2030 timeframe. After IOC, within anticipated procurement budget constraints, it will take a decade or two to replace the legacy system. It must be emphasized that this schedule applies only to the first FVL version. Funding constraints will limit development, testing, and procurement of the second and third variants to later timeframes.

932 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

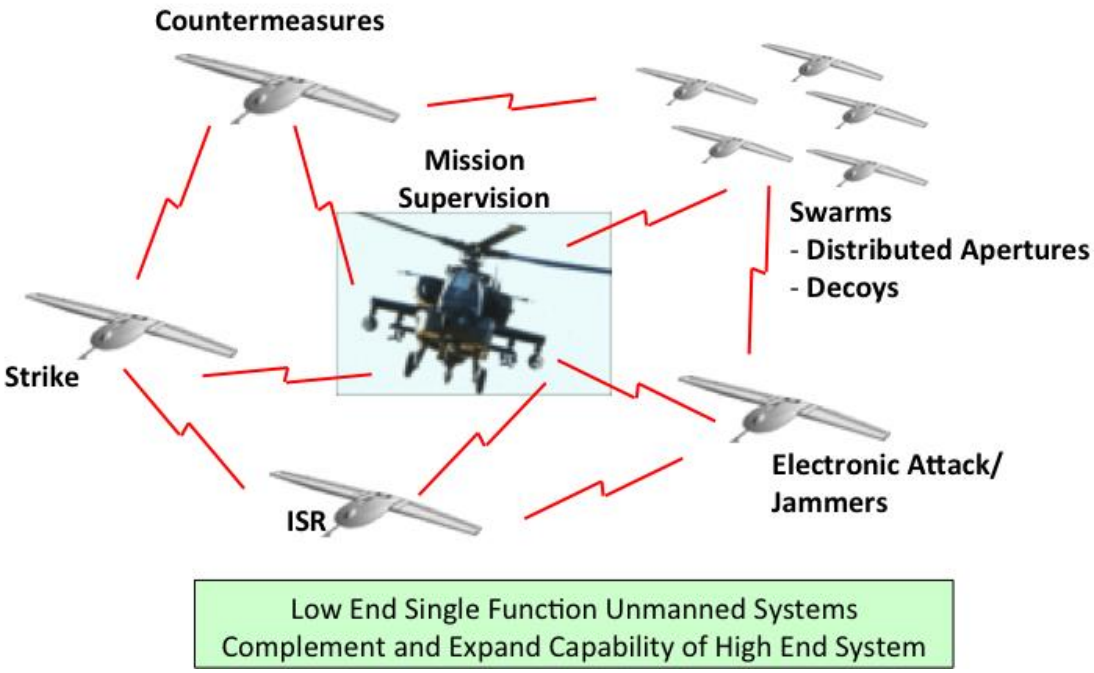

Figure 2-11 Distributed Functionality Collaborative System-of-Systems Concept

Acceleration of the FVL program would seem to provide some obvious benefits toward mitigating this issue. However, three roadblocks stand in the way of program acceleration: funding constraints, acquisition processes, and technology maturity.

Achieving affordability of FVL aircraft is critical to dealing with limited funding. Affordability, in turn, is driven by requirements. As the only new Army Aviation program on the horizon, FVL will be pressured by the operations community to have system and performance requirements that satisfy every possible operational need. Lack of requirements discipline is one leading cause of acquisition program failure. FVL will be no exception if the requirements process is not tightly managed and constrained. An approved DoD acquisition process, known as evolutionary acquisition, could prove to be of great value in managing requirements growth and in accelerating the introduction of FVL into the inventory. Under this acquisition strategy, the operational and acquisition communities would agree on a set of objective performance requirements, but also concur on a more limited set of the objectives that could provide an effective early operational capability. Pre-planned capability upgrades leading to the full set of objective requirements would also be defined. Such an approach would help not only to manage requirements, but also to accelerate IOC for a limited capability set.

Such acceleration, however, is dependent on technology maturity. In addition to unrealistic requirements and/or requirements growth, unrealistic evaluations of technology maturity is an additional significant cause of acquisition program failure. Fortunately for FVL, due to major industry investment, the JMR-TD demonstration vehicles will have greater fidelity and be more representative of the FVL-Medium operational design than would normally be expected. Parallel

933 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

investments in the FACE/JCA open system architecture could provide the technology basis for some acceleration of a Milestone B DAB. This option is discussed in more detail in section 4.5.

The third challenge category is the lack of an Army Aviation capability to provide the heavy vertical lift necessary to support maneuver of dispersed mechanized forces in austere areas of operation. Because of the investment required to develop and produce the FVL-Medium class of aircraft, simultaneously developing an ultra-heavy class is simply not within the TOA of Army Aviation for the foreseeable future. Interim solutions that partially meet the heavy lift requirement are the only fiscally realistic options available to the Army. Potential interim solutions are discussed in section 4.2.

While this discussion has focused on the challenges facing Army Aviation, it is worth noting that many of the same forces driving the challenges also open opportunities for advancing Army Aviation to win in a complex world. In particular, expanded roles and missions for UAS and the better integration and collaboration of manned and unmanned assets provide the capability for new/improved roles and missions for Army Aviation as the character of future warfare continues to evolve. The system-of-systems distributed functionality concept introduced earlier (Figure 2-11) opens multiple new options for Army Aviation to contribute to Joint force effectiveness in future conflicts. As just one example, Army Aviation could play a more significant role in two missions that are normally tasked only to USAF forces: air superiority and SEAD. In the case of air superiority, lethal UAS under supervisory control of either Army or USAF manned attack assets could support the attack of threat airfields. SEAD missions could be enhanced through use of collaborative functionality formations that utilize UAS as stand-in jammers. Other opportunities are clearly possible, but they are limited for the 2025-2040 timeframe by funding constraints, particularly limited budgets for UAS and MUM-T.

934 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

3 KEY INNOVATIVE TECHNOLOGIES: FOCUS AREAS FOR IMPROVEMENT

The study Terms of Reference requested that the team address the use of innovative technologies that increase capabilities, overall mission effectiveness, survivability and lethality while reducing sustainment requirements, including logistics footprint and frequency of resupply. This section explores such innovative technologies.

It should be noted that these innovative technologies will be most effective when integrated with other technologies. For example the Degraded Visual Environments (DVE) effort involves integration of sensor technologies, cueing technologies, and flight control technologies. The integration of unmanned systems, manned-unmanned teaming, and manned platforms into a system-of-systems provides the most promising means for affordable mission effectiveness. Incorporating Joint capabilities into an overall operating concept will help to ensure maximal effectiveness of these systems.

3.1 Challenging Environments

3.1.1 Degraded Visual Environments

In recent years, Army Aviation operations have experienced a series of serious accidents, several fatal, in which helicopters were losing stability as they landed in sandy areas of Iraq and Afghanistan. In 2010, a DoD study[8] found:

> "During Operation Enduring Freedom and Operation Iraqi Freedom (OEF/OIF), there were 375 rotorcraft losses with 496 fatalities from October 2001 to September 2009. Mishaps accounted for 81 percent of all losses with combat losses (i.e., aircraft shootdowns) accounting for the remaining 19 percent; 73 percent of the fatalities occurred in a combat theater. … The combined mishap loss rate (both combat non-hostile and non-combat) was 2.71 losses per 100,000 flight hours, slightly exceeding the loss rate due to combat hostile action. The in-theater mishap loss rate was ten times worse, and the out-of-theater loss rate was four times worse than the Congressional and SECDEF goal of 0.5 mishaps per 100,000 flight hours. Loss of situational awareness and other human factors accounted for more than 79 percent of the losses of airframe and fatalities. The primary causal factors are controlled flight into terrain and brownout."

The problem was that as the helicopters approached the ground they generated a large cloud of dust that completely surrounded the aircraft, causing a condition called "brownout" that virtually blinded the pilot. The brownout caused the pilot to lose orientation, which could cause the helicopter to tilt as it came close to the ground, with the rotors striking the ground. The Army identified this condition, which they called Degraded Visual Environment (DVE), and expanded it

[8] Mark Couch (IDA) and Dennis Lindell (Joint Aircraft Survivability Office), "Study on Rotorcraft Safety and Survivability," presented at American Helicopter Society 66th Annual Forum, DTIC A547531, May 2010.

935 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

to include other environments that are visually degraded, as illustrated in Figure 3-1. Two of these environments are induced by the aircraft: brownout in dusty terrain and whiteout in snow-covered areas. Naturally occurring environments include smoke, sand/dust storms, fog, rain, clouds, snow, smog, night, and flat light. DVE mitigation became one of Army Aviation's three highest priority needs. In addition to safety considerations, a key objective of DVE capability development efforts is to enable commanders to conduct operations deliberately in DVE because they will have an advantage over the adversary.

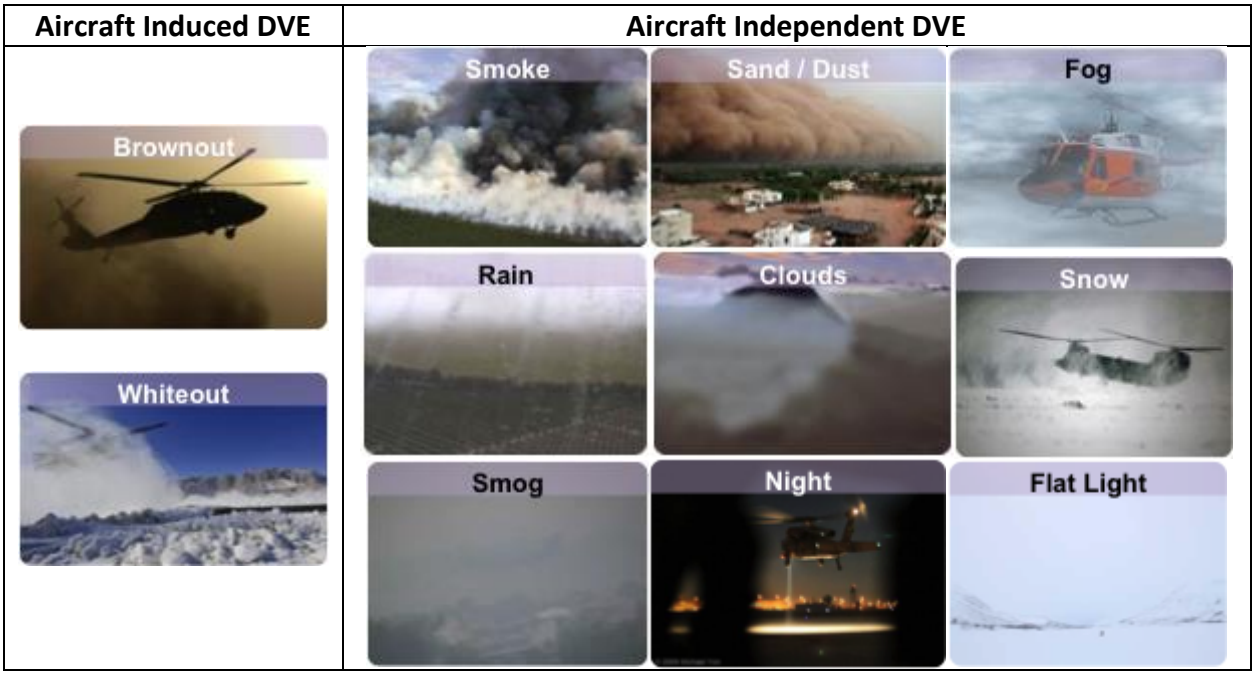

Figure 3-1. Degraded Visual Environments (2 + 9)

DVE mitigation is an RDECOM-wide effort based on integration of three technologies supported by complex computing. It includes work in three principal areas:

- Sensing – led by CERDEC
- Cueing – led by ARL (working with the US Army Aeromedical Research Lab - USAARL)
- Flight controls (to stabilize aircraft handling) - led by AMRDEC-ADD-AFDD

The threshold demonstration goals for the DVE program include rotorcraft pilotage capability in all limited visibility environments, all-around situational awareness, and the ability for multiple aircraft to cooperatively operate within DVE. The Army plans to test these goals by FY2020.

Limited Visibility Close to Ground – Sensor Development

Brownout is caused by the downdraft created by a helicopter as it lands over dust-covered ground. The cloud of dust creates a very opaque environment that makes it impossible for the pilot to see farther than one or two feet beyond the windshield of the cockpit. Sensors able to penetrate and generate images through the dust cloud are needed.

936 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

Sensor development work pertinent to DVE is being conducted at Fort Belvoir by the Night Vision and Electronic Systems Directorate (NVESD), an important element of CERDEC. NVESD technologists have identified a spectral "window" in the long-wavelength infrared (LWIR) band through which electromagnetic radiation can penetrate. Exploiting this phenomenon they have developed a sensor sensitive to that wavelength that is able to "see" through dust clouds. Unfortunately, the technology does not extend to other DVE conditions. Nevertheless, in theaters where dust is prevalent, the Army should seriously consider funding the integration of such sensors with the flight operating systems of its helicopters to enhance the pilot's ability to ``see'' through brownout.

CERDEC and Army Research Laboratory are also investigating the potential use of ladar and radar systems to overcome DVE. For example, high-resolution ladar images could be collected and stored prior to entering the landing zone and integrated with lower-resolution but obscurant-penetrating RF data to provide pilots with enhanced imagery and improved overall visibility.

Cueing and Flight Control Development

Cueing alternatives such as combinations of visual, aural, and tactical cues are being evaluated by the US Army Aeromedical Research Laboratory (USAARL) to optimize pilotage and aviator workload. USAARL is planning to assess DVE solutions in real-world environments, including high workload, reduced cues, fatigued aviators, and environmental stress. AMRDEC is exploring revised symbology sets such as the BrownOut Symbology System (BOSS), which attempts to present a single symbology strategy from start to finish of the approach, thereby eliminating the need to change pages or change scales.

AMRDEC is also developing modern control laws (MCLAWS) to improve flight control in legacy systems. These techniques can support additional automated flight modes, enabling capabilities such as terrain and obstacle avoidance and automated safe-landing modes. MCLAWS-2 is designed to provide an attitude-command/attitude-hold response type for improved handling in near-Earth operations at night and in poor weather. In-flight tests on the UH-60 demonstrated that both pilot workload and heading errors were reduced.

Addressing DVE in Future Integrated Programs

The RDECOM S&T effort is focused on developing an integrated DVE-Mitigation (DVE-M) system to be demonstrated in 2020. Component technologies will be demonstrated through FY2015. DVE-M goals include multi-ship networking for sharing of data and increased threat awareness from fused sensor data.

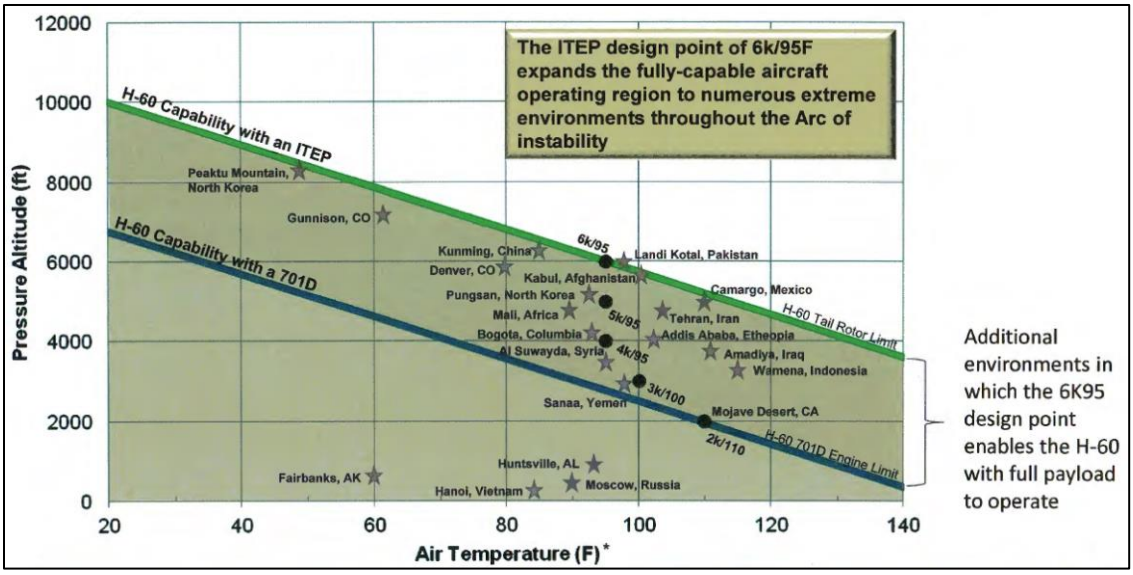
The study team considers the RDECOM DVE goals to be both appropriate and feasible. In addition, reduced pilot workload arising from DVE technologies should increase operational mission capacity (e.g., enabling formations with UAS).

937 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

Just as adversaries have been able to acquire or develop night vision technology after US forces demonstrated the ability to "own the night," it must be anticipated that over time adversaries will also be able to operate in DVE. To maintain the advantage as long as possible, care must be taken to protect the technologies where feasible.

3.1.2 High/Hot Environments

During the 1970s, the Army required helicopter engines that could transport an 11-person squad at 4,000 ft altitude at 95°F. Based on more recent experience, the requirement has been raised to carrying the same load to 6,000 ft altitude at 95°F.



Higher altitude or hotter temperatures, or both, lead to lower air density, which in turn reduces the lift generated by the rotors or wings. Reduced density also degrades the performance of the aircraft engines, exacerbating the problem. The primary short-term means for overcoming the effect of low density is to reduce aircraft weight, usually by reducing payload or fuel load. For example, during the Iraq and Afghanistan wars, Black Hawk helicopters were regularly flown at higher altitudes and hotter temperatures than their engines were designed to withstand. With underpowered engines in those conditions, each helicopter could carry only five soldiers — about half of an 11-person squad.[9]

Over the longer term, vehicle and engine designs can be modified to improve performance. The Advanced Affordable Turbine Engine program is working to develop an engine that is the same size as the legacy Black Hawk's General Electric T700 engine but 50% more powerful and 25% more fuel efficient. This technology will be incorporated into the Improved Technology Engine Program (ITEP) that will undergo a downselect in 2018 and the first engine test in 2021.

Figure 3-2 shows the nominal operating environments for a Black Hawk powered by the T700 engine and by the ITEP. Note that several locations of interest, such as cities in Afghanistan, Iraq, Iran and Columbia, cannot be reached using the T700 engine without reducing payload. The ITEP supports both Apache and Black Hawk modernization programs. The Future Affordable Turbine Engine (FATE) provides similar improvements for the Chinook. These advanced engines will also support the Future Vertical Lift program.

3.2 Condition-Based Maintenance and Near-Zero Maintenance Aircraft

Major advances in the development and use of aircraft health monitoring systems have been achieved over the last several decades. Such systems, now widely deployed on both commercial and military aircraft, offer significant potential for making maintenance operations a predictable and controllable activity. They enable the development and implementation of condition-based maintenance (CBM) practices that offer significant benefits in various areas compared to traditional corrective, preventative, and phased maintenance approaches. CBM is a maintenance process based on the known condition of various system components rather than a phased/scheduled inspection, repair, and replacement process. It involves monitoring the health and usage of components using sensors of various types to provide a rational basis for predicting individual component failure and establishing an appropriate timeline for repair and/or replacement actions. For fixed-wing aircraft, Boeing has successfully incorporated CBM into most of its aircraft systems, resulting in both reductions in maintenance costs and an overall increase in aircraft availability. CBM enablers have also been incorporated into numerous commercial and military rotary wing aircraft.

The Department of Defense has a longstanding commitment to implementation of CBM practices for a comprehensive range of defense systems, as reflected in establishment of its Condition Based Maintenance Plus (CBM+) Initiative in November 2002.[10] CBM+ is stated to be "an evolving set of maintenance capabilities focused on inserting technology into new and legacy systems that will improve supportability, lead to more efficient and effective business processes, and transform DoD's maintenance environment." It is intended to build on "the solid foundation of condition-based maintenance," but it also includes a wide range of other maintenance and

[10] Department of Defense, "Condition-Based Maintenance Plus (CBM+): A DoD Initiative," November 2014. http://www.rwappleton.com/downloads/CBMDODPublication.pdf.

939 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

logistics considerations. CBM+ is "condition-based maintenance enhanced by reliability analysis; it is routine predictive maintenance based on the evidence of need and forecasted by analyzing data collected through automated sensors and systems." Development and implementation of effective CBM+ practices are intended to contribute to improved weapon system and equipment performance, as well as lead to enhanced readiness, more efficient maintenance, reduced logistics footprints, and associated cost savings.

Stated policy key tenets for CBM+ include (1) need-driven, reliability-centered maintenance, (2) embedded diagnostics and prognostics, (3) automated maintenance information generation, (4) analysis-based reliability and sustainability process improvements, (5) integrated information systems responding to equipment condition and tasking, (6) smaller maintenance and support footprints, and (7) improved operational availability and performance. Cited examples of CBM+ enabling features include (1) sensors, embedded onboard or off-board (portable) equipment interfaced to a platform, together with software programs to facilitate analysis, (2) data collection, (3) maintenance information systems network for both up line reporting/recording and downline support, (4) information tools (interactive electronic technical manuals, portable maintenance aids, computers, etc.), (5) engineering analysis to identify trends and provide a dynamic maintenance plan, and (6) systems integration linking logistics and maintenance.[11] Development and implementation of CBM+ capabilities is clearly a complex process. An ultimate issue is whether, and how soon, it might lead to desired near-zero maintenance aircraft (ZMA) for Army Aviation.

Over the last several decades, the DoD and the Services have made major investments in the development of technological capabilities important to the continuing advance of CBM capabilities. Early major investments by the Army led to the development of integrated vehicle structural health monitoring capabilities such as the IVSHM system, developed by Goodyear for Army Aviation in 2002, and health and usage monitoring systems (HUMS), such as the system developed for the UH-60 Black Hawk.[12] HUMS capabilities have subsequently been integrated into most Army rotary wing aircraft (AH-64D, OH-58D, and CH-47D helicopters; all US Army Special Operations Aviation Command helicopters). HUMS is a sensor-based monitoring system that enables preventative maintenance by measuring the health and performance of mission-critical components. It has been cited as "the kind of environment that CBM+ is trying to establish."[13] By continuously monitoring vibration at numerous points throughout the drive train and pinpointing mechanical faults before they become catastrophic failures, HUMS provides actionable information that allows the military operators to anticipate mechanical failures and make anticipatory maintenance decisions.[14] Realized benefits include greater aircraft availability,

940 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

lower costs resulting from reductions in unplanned maintenance events, more optimal parts inventory management and logistics, and enhanced safety.

All of the Services have significant ongoing efforts to develop CBM+ capabilities, particularly for aviation systems. For the Army, those efforts are very comprehensive and extend across all of the principal RDT&E categories, as summarized in Appendix E - Army Aviation Efforts. Two major active Army efforts are the Autonomous Sustainment Technologies for Rotorcraft Operations (ASTRO) program and the Ultra Reliable Design program.[15,16] The ASTRO program is a jointly funded effort by industry and the Aviation Applied Technology Directorate of AMRDEC to develop and demonstrate technologies and methodologies enabling more efficient designs and reduce the maintenance burden for current and Future Vertical Lift (FVL) aircraft. Its principal focus is on advanced technologies for propulsion, structures, rotors, and drives. The objective of propulsion technology work is to demonstrate adaptive engine controls to optimize performance, component life, and maintenance schedule based on engine health. The structures technology effort seeks to develop technologies for assessing the structural integrity of a primarily composite airframe, verifying the integrity of composite repairs, and predicting remaining useful life. Rotors technology work is developing automated methods to sense rotor system track and balance and enable real-time adjustments in flight. Drive system technology activities include development of planetary gear failure detection and weight reduction technologies, culminating in an integrated transmission demonstration in FY2016.

The Army's Ultra-Reliable Design program will develop a set of tools, methodologies, and materials to apply ultra-reliability concepts to the design and operation of FVL aircraft. Ultra-reliability has been defined as an order of magnitude improvement in materiel reliability over the current standard, achieving higher availability while reducing life cycle costs and downtime associated with maintenance activities. The program will be executed in three phases:

- Phase 1 will assess materiel reliability of current Army aircraft in the Army fleet and key reliability drivers for future aircraft; identify and analyze effective design-for-reliability practices; identify current and future technology transition points applicable to FVL reliability; and recommend technology investments, reliability design criteria, and potential development or acquisition process changes required to achieve ultra-reliable rotorcraft design.
- Phase 2 will develop design tools, methodologies, and materials consistent with the findings of the Phase 1 assessment and applicable to the design of future aircraft.
- Phase 3 will develop and demonstrate modeling and simulation tools and components/ sub-systems to verify and validate the tools, methodologies, and materials developed in Phase 2.

941 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

A noteworthy example of Navy efforts to develop CBM capabilities for rotary wing aircraft is its ongoing development of an Integrated Hybrid Structures Management System (IHSMS) as an important element of its Future Naval Capabilities program.[17] Its focus is on rotor and airframe components of USMC CH-53K helicopters. Principal objectives include reducing total ownership costs, increasing operational availability, and improving flight safety. The work includes developing advanced capabilities for load/load-history tracking for dynamic components and airframe hot spots, damage detection and monitoring, damage growth and criticality prediction, and micro-climate environmental monitoring. Enabling capability metrics/goals include significant reductions in material maintenance costs, maintenance man hours per flight hour, and weighted elapsed maintenance time. Detailed design work for the system architecture and technology integration on CH-53K have been completed, and planned functional and risk reduction tests are in progress.

Air Force activities to develop advanced CBM capabilities for fixed wing aircraft include sustainment work involving diagnostics and prognostics advanced technology development, particularly for aircraft engines. Near-term goals include the development of improved non-destructive inspection (NDI) tools. Mid-term goals include development of advanced automated NDI tools, CBM plus structural integrity, and probabilistic life prediction tools. Over the longer term, prognostics capabilities are intended to be an integral part of aircraft engine development. Ongoing Air Force Sustainment Transition efforts are intended to demonstrate selected sustainment technologies for transition into AF systems to increase readiness, reduce life cycle costs, and extend service life. They include assessment activities involving NDI and structural health monitoring for state awareness and diagnostics; prevention activities involving redesign, life enhancement, repair practices, and replacement concepts; and management practices involving fleet management, decision tools, reliability improvements, and infrastructure. Active Propulsion Sustainment efforts seek to demonstrate and transition technologies that improve safety, readiness, and cost. Technologies under development include prognostic health monitoring as an integral part of aircraft engine development.[18]

Various analyses have demonstrated the potential and realizable benefits of CBM capabilities. An early Army cost/benefit analysis for HUMS reported “an advantage in flight hours completed and operation readiness rates, coupled with a marginal decline in hours of non-mission capable for maintenance reported.”[19] A more recent Army analysis indicated that CBM+ efforts as of 2012 had demonstrated notable benefits with respect to combat power (mission capable rates) and aviator safety.[20] CBM-equipped aircraft demonstrated the ability to generate more flying hours

942 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

than the non-equipped fleet, lower mission-abort rates (up to 19.6% depending on platform variant), and contribute to enhanced safety through accident avoidance. The use of CBM equipment to accurately record flight hours was estimated to reduce scheduled maintenance burden by 12-22%, with corresponding savings in contractor labor and mean time between failures. Further, the Army Aviation CBM+ initiative was reported to be responsible for "hundreds of small, nearly unquantifiable gains in terms of troubleshooting time, precautionary landings that did not happen, avoided unnecessary maintenance procedures, and more." A business case analysis for the Navy IHSMS program previously described has shown a positive return on investment with respect to cost benefits and significant reductions in maintenance man hours and elapsed maintenance time.

For the Army, commitment to CBM+ has been Aviation first, and the importance of CBM practices to Army Aviation has long been recognized. In 2004, an *Army Aviation* article noted the great potential offered by CBM technology to monitor the health of aviation systems and subsystems through the use of on-board diagnostics (near-term goal) and on/off-board prognostics (long-term goal), leading to component reliability improvements, reduced maintenance manhours, and reduced aviation accidents and incidents.[21] Such capabilities were projected to lead to "a fully modernized and transformed sustainment environment for the future that supports multifunctional, expeditionary and combined-arms units on a distributed, non-linear battlefield." In a 2006 *Army* article, the Commander, US Army Aviation and Missile Life Cycle Command reiterated that potential and stated that the "Army's vision is to achieve CBM+ goals by the end of fiscal year 2015," but noted that "transition to CBM+ is contingent on incorporating enhanced technology on existing aviation systems and embedding those capabilities into future and developmental aviation systems."[22] Due to significant technical and implementation challenges, that goal has not been realized to date, even though large numbers and a variety of diagnostic sensors of various types have been incorporated into fielded aircraft. Nevertheless, continuing progress in the development of sensing and reporting technologies over many years has enabled the emergence of CBM practices as the desired standard for Army rotorcraft, and the Army remains committed to achieving the principal CBM+ goals: (1) reducing burdensome maintenance tasks currently required to assure continued airworthiness, (2) increasing aircraft availability, (3) improving flight safety, and (4) reducing sustainment costs.[23] The functional capabilities intended to be implemented on all Army aircraft onboard CBM systems include engine monitoring, dynamic system component monitoring, structural monitoring, exceedance recording, usage monitoring, electronic logbook interface, and electronics.

943 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

Despite considerable interest in and extensive RDT&E activity directed toward the development of advanced CBM+ capabilities for defense systems, clear commitments by DoD and the Services, considerable progress in selected areas, and noted recorded benefits, overall progress toward comprehensive implementation of CBM+ practices has been slow. CBM in many respects remains in an extended mid-state of development due to its overall complexity – reflected in part by the extensive range of relevant Army RDT&E activities summarized in Appendix E – and numerous technical and implementation challenges. An overarching problem is that the substantial infrastructure required for CBM did not exist when the Army committed to it, including diagnostic tools for data collection, established data analysis methodology, and effective "big data" management systems. Another factor contributing to the comparatively slow rate of CBM implementation is that program managers for specific systems and other interested groups, including depot maintenance personnel, logistics specialists, and financial managers, need to be made more fully aware of CBM benefits, commit to an integration plan, and then find the required resources. Differing interests and concerns of certain elements of the Army Aviation community have also had an impact.[24]

Diagnostic sensors of various types capable of providing information regarding vibration, stress and strain, cycle times, temperature, wear, and more of many system components, sometimes in combination with environmental factors (desert, arctic, high-humidity, usage, profiles, and more) have been applied to numerous Army aircraft. They reportedly are capable of generating hundreds of megabytes of data per aircraft per flight hour. But that data needs to be stored, moved, and analyzed in the context of detailed knowledge regarding degradation and failure of critical components. Obtaining such knowledge requires extensive testing under realistic operating conditions. The ability of diagnostic devices to accurately and reliably identify, classify, and quantify emerging problems under such conditions must be firmly established. Required robust data/information management systems remain under development, analyzing overwhelming amounts of flight data presents a significant challenge for engineers, too little is known regarding dominant degradation and failure mechanisms for many critical components, and the extensive testing of innumerable system components is cost prohibitive. The comprehensive component performance data and statistical confidence that lie at the heart of developing reliable prognostic algorithms is lacking. Although CBM+ can manage unscheduled maintenance needs very well by providing useful information suggesting that a particular component is exhibiting an off-nominal condition, leading to proactive maintenance action, false alarms can be problematic by requiring maintenance attention when none might be required. In that context, diagnostic and prognostic tools need to be more reliable than the components being assessed. Another limitation is that CBM processes require the ability to detect "graceful degradation" of monitored components; they cannot lessen the consequences of unanticipated catastrophic component failures. As noted in Army Regulation AR 750-1, "CBM does not lend

[24] Christopher Smith, US Army AMCOM, formerly the CBM lead for Army Aviation, private communication, 14 September 2015.

944 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

itself to all types of equipment or possible failure modes and therefore will not be the sole type of maintenance practiced."[25]

The Army's longstanding interest in CBM+ processes is driven by their proven ability to enhance weapon system and equipment performance, contribute to enhanced readiness, enable more efficient maintenance, reduce logistics footprints, and provide significant cost savings, as previously noted. Comprehensive implementation of CBM+ processes is essential to achieving a desired Army objective of "near-zero maintenance aircraft" (ZMA) for well-defined operational periods. The concept refers to the goal of establishing a Maintenance Free Operating Period (MFOP) during which an aircraft can be expected to operate effectively for a specified number of flight hours, requires no scheduled maintenance actions, and maintains a high Operational Availability (A_O) during which it is able to perform a high percentage of intended mission profiles. Army goals for MFOP are 480 flight hours (Threshold) and 720 flight hours (Objective). Stated goals for A_O are 90% (Threshold) and 95% (Objective). Additional goals associated with the ZMA concept involve Mean Down Time (MDT) and Mean Time to Repair (MTTR) (unscheduled). MDT goals are the lesser of 4.5 days or 216 maintenance man hours (Threshold) and the lesser of 3.0 days or 144 maintenance man hours (Objective). MTTR goals are 3.0 maintenance man hours (Threshold) and 1.5 maintenance man hours (Objective).[26]

Given the current state of development of CBM+ capabilities, these goals must be viewed as potentially achievable only over the long-term, principally for FVL platforms where the appropriate means for incorporating CBM+ diagnostics and data management capabilities have been made an integral part of the aircraft design process. CBM+ implementation to the extent required to achieve near-zero maintenance capabilities for legacy aircraft presents near-insurmountable challenges because aircraft design, maintenance management procedures, and Army maintenance policy were not developed to be consistent with actual CBM+ practices. It may also be cost-prohibitive, where, as noted in Army Regulation AR 750-1, "CBM is best implemented as early as possible in the systems life cycle to minimize costs." While continuing to incorporate additional emerging CBM+ capabilities into legacy aircraft can be expected to enhance operational availability and provide maintenance cost and logistics benefits, it is not likely to achieve the stated goals of the ZMA concept for these aircraft.

3.3 Manned-Unmanned Teaming

Current Army Aviation UAS assets consist of the Raven, Puma, Shadow and Gray Eagle systems. These systems are all fixed wing, have limited autonomy, limited Manned-Unmanned Teaming (MUM-T) capability, and are essentially dedicated to a single mission (ISR, although Gray Eagle can carry Hellfire missiles in addition to ISR payloads). Currently AH-64E Apaches have capability for LOI 4 control (see Figure 3-3) of Shadow and Gray Eagle. Collaboration by means of MUM-T is constrained by lack of autonomy and by the UAS communications architecture; the UAS communicate primarily with ground control systems rather than directly with each other or with

[25] Department of the Army, *Army Regulation AR 750-1, Army Materiel Maintenance Policy*, 12 September 2013, http://www.apd.army.mil/pdffiles/r750_1.pdf.

945 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

other aviation assts. The lack of autonomy also adversely impacts the cost to operate UAS, because one or more operators are required for each UAS.

Level 1 – Indirect receipt/transmission of UAS related payload data
Level 2 – Direct receipt of UAS video and other sensor information
Level 3 – Control of the camera and sensors on the UAS
Level 4 – Control of the flight path and payloads
Level 5 – Full control of the UAS, including takeoff and landings

Figure 3-3. MUM-T Levels of Interoperability

Army Aviation recognizes the limitations associated with current UAS operability and has plans to improve autonomy and MUM-T capabilities. A key effort is the Synergistic Unmanned Manned Intelligent Teaming (SUMIT) program, described in Figure 3-4. This multi-year project is intended to demonstrate an integrated suite of aiding and autonomy technologies that will enable aviators to exploit UAS as an integral part of collaborative manned-unmanned teams. While these goals are noteworthy, the funding currently being provided to accomplish them is only about $5M/year.

MILESTONE	FY14	FY15	FY16	FY17	FY18	FY19	FY20	FY21
SUMIT Part 1								
SUMIT PART 2								
S&T 32.2 M PE/Project: 63003/436	3.1	4.5	5.5	6.7	6.8	5.9	6.0	6.0

Purpose:

Demonstrate an integrated suite of aiding and autonomy technologies that enable Aviators to exploit Unmanned Aerial Systems as an integral part of a manned-unmanned team

- Develop Cognitive Decision Aiding to manage and interact with UAS over key aspects of the scout-attack mission
- Develop teaming capability for the next generation aviation systems

Product

PART 1: Future Rotorcraft Cockpit Definition

- Gov owned & run intelligent cockpit development environment to assess decision aiding techniques
- Limited user evaluations of decision aiding, multi-UAV supervisory control, OPV/Commanders Role & HMI

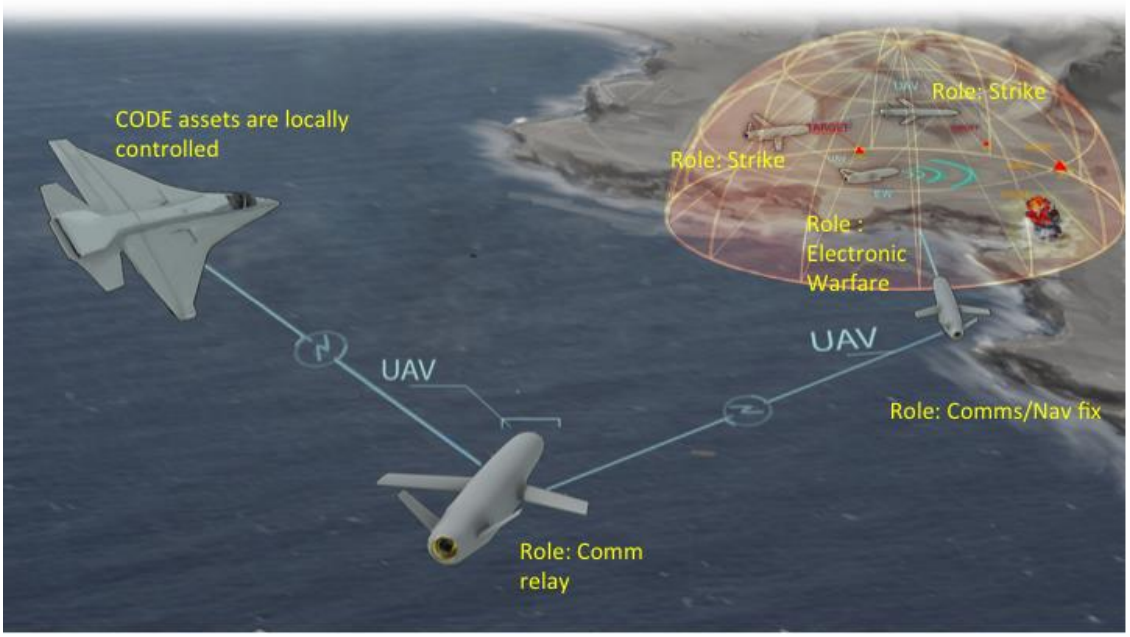
PART 2: Advanced Decision Aiding and MUM Technology

- Develop complex decision aiding to manage a MUM team in a future Scout/Attack mission in Gov simulator.
- Implement JCA standards for ease of integration to FVL, JMR and current fleet

PART 3 Flight Demonstration

- Demonstrate manned/unmanned teaming and decision aiding technologies

Payoff



- JCA conformant cockpit the supports advanced decision aiding for MUM teams
- High levels of autonomy to reduce operator workload allowing for tactical MUM teaming
- Help define the future Air Mission Commanders Role
- Cockpit lessons learn will inform FVL and the future fleet

Figure 3-4. The Synergistic Unmanned Manned Intelligent Teaming (SUMIT) Effort

AMRDEC is also working with DARPA on the Collaborative Operations in Denied Environment (CODE) program, which is investigating collaboration not just of a UAS with a manned system but also among a number of UAS with distributed functionality, as illustrated in Figure 3-5. The program is specifically looking at expanding the mission capabilities of UAS through increased autonomy and inter-platform collaboration. In this concept, the manned aircraft serves as the

946 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

mission supervisor, but much of the functionality to prosecute the mission is distributed onto low-cost UAS systems, which operate autonomously unless directed by the mission supervisor. Distributing the functionality improves mission effectiveness and survivability in two ways. First, it greatly complicates threat response and adds another survivability layer around the high-value manned asset that the threat must defeat. Secondly, it allows much of the functionality that would normally be required to be carried on one high-value manned asset off-loaded to relatively inexpensive modular UAS that can be tailored to carry payloads required for a particular mission. This reduces the ratio of cost of potential blue force asset loss to threat cost. At some acceptable low-cost level, the UAS platforms might be considered as "attritable."

Source PM UAS briefing

Figure 3-5. DARPA/AMRDEC Collaborative Operations in Denied Environment (CODE)

The SUMIT and CODE projects are noteworthy and can provide a good basis for the *eventual* development and deployment of semi-autonomous (i.e., supervised autonomy) UAS and collaborative MUM-T. However, greater emphasis and funding will likely be necessary to ensure that "eventual" falls within the 2025-2040 timeframe.

3.4 Survivability/Lethality

Army Aviation rotorcraft are an indispensable component of Army forces and play a critical role in the successful conduct of Army ground combat operations. The survivability, lethality, and overall operational effectiveness of these assets is of paramount importance as they provide attack/reconnaissance capability in support of ground operations, assault capability in moving troops and equipment around the battlefield, logistics support, and medical evacuations. Significant threats to aircraft survivability include enemy man-portable air defense systems (MANPADS), surface-to-air and air-to-air missiles, enemy UAS, electronic warfare and DE threats,

947 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

and small- and medium-caliber projectiles from ground fire in pickup and landing zones. Aircraft survivability against such a broad spectrum of current, emerging, and projected future threats requires the development of synergistic survivability capabilities that include integrated planning, teaming, and both active and passive technologies.

Considerable discussion of rotorcraft survivability against such threats was provided in Section 2.1.1, which particularly emphasized the layered approach to survivability represented by the survivability "onion" depicted in Figure 2-9. Outer layers of the overall approach require capabilities to avoid detection and engagement, which can be achieved through EO/IR and acoustic signature reduction, other advanced technologies, and new CONOPS and TTPs. Improved situational awareness, more effective active countermeasures, and greater aircraft agility/maneuverability can enhance Army Aviation survivability by inhibiting detection and engagement by adversaries. Inner layers of the multi-layered approach are concentrated on avoiding or absorbing damage and avoiding catastrophic destruction, enabling the aircraft to complete its mission and remain available for future service. Armoring selected areas (providing passive protection systems for pilots and critical aircraft components against conventional small- and medium-caliber ballistic threats), incorporating redundancy into the most mission-critical systems, exploiting high-durability and damage-tolerant design features and materials, and various other factors, including advanced TTPs and training, are all important to enhancing survivability. The ability of rotorcraft to operate in degraded visual environments (DVE), discussed in Section 3.1.1 above, can also be expected to contribute to aircraft survivability by reducing aircraft visibility in the visual and IR spectral regions, thereby helping to avoid damage. Coordinated MUM-T operations, discussed in Section 3.3, represent another important potential contributor to future aircraft survivability.

A comprehensive range of integrated survivability capabilities is being actively investigated in Army research and development efforts by AMRDEC's Advanced Development Directorate. The work includes technologies important to all of the survivability layers depicted in Figure 2-9. Detailed discussion of those efforts is beyond the scope of this ASB study, but it may represent an opportunity for a future study focused principally on Army Rotorcraft Survivability and Lethality. Two specific AMRDEC/ADD aircraft survivability programs of note, however, are the Route Optimization for Survivability Against Sensors (ROSAS) program and the Close Combat Survivability (CCS) program.[27] A stated goal of the ROSAS program is to "demonstrate a real-time route planner function to provide rapid and survivable routes to safely evade the full spectrum of dynamic pop-up threats in complex terrain" and enable the aircraft to complete its mission objective. Payoffs include improved situational awareness and increased survivability of warfighters and aircraft against a robust spectrum of threats. Flight demonstrations on a test range of Modular Integrated Survivability (MIS) hardware and software are scheduled for FY2017. The CCS program seeks to develop and demonstrate "next-generation signature-reduction capabilities to delay/deny aircraft acquisition and engagement by the full spectrum of portable threat weapons." The program includes a focus on technologies that provide low rotorcraft

[27] Torrey Deas, "Mission System Survivability Technical Area Program Overview," AMRDEC/ADD briefing to ASB, March 2015.

948 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

contrast against sky and terrain backgrounds under diurnal conditions. It also includes work to design an adaptive IR engine suppressor capability to optimize IR signature reduction and aircraft lift and range performance, as well as to develop real-time aural detection algorithms that include aircraft maneuver data. CSS program advances, which are transitioning into the Signature Reduction for Advanced Threats (SRAT) effort in FY2016, are intended for eventual transition to both the current and future fleet.

Army Aviation lethality principally derives from weapons deployed on Apache AH-64 platforms. The Apache is the Army's primary attack helicopter, described as "a quick reacting, airborne weapon system that can fight close and deep to destroy, disrupt, or delay enemy forces."[28] It was designed to fight and survive both during the day and at night, as well as in adverse weather conditions. Apache armament provides lethal capabilities against a wide range of targets. The most lethal weapon system deployed on the Apache is the 16 AGM -114 Hellfire missiles; up to 16 missiles can be carried in pods mounted on the stub wings. Hellfire variants featuring either tandem shaped charge, blast/frag, or thermobaric warheads are highly lethal/effective against medium- and heavy-armored combat vehicles, buildings, bunkers, and selected other high-value targets. Precision guidance over an effective range that extends out to about 8 km is provided by semi-active laser or mm-wave radar seekers. The lethality of Hellfire missiles has been demonstrated in recent combat operations in the Persian Gulf, Afghanistan, and Iraq.

Other highly lethal armament deployed on AH-64 Apaches include 70mm (2.75-inch) Hydra rockets, a 30mm M230 chain gun, and AIM-92 Air-to-Air Stingers (ATAS). The Hydra rockets provide lethal effects against enemy personnel, light armored vehicles, and other soft materiel targets; up to 76 rockets can be carried in pods mounted on the Apache stub wings. The M230 chain gun is an area weapon system providing accurate air support with minimal collateral damage. It produces lethal effects on various light- and medium-armored vehicles, enemy personnel, and other ground targets. The gun fires 30mm High Explosive Dual Purpose (HEDP) M789 ammunition to ranges of about 3 km with both significant penetration and fragmentation effects; lethal radius against unprotected, standing enemy combatants is about 3 m. Ongoing work at ARDEC is developing an M789 upgrade that will enhance M230 chain gun lethality by incorporating proximity fuzing and controllable air burst capabilities. The AIM-92 Stingers, which were developed from the shoulder-launched ground-to-air FIM-92 Stinger system, contain a blast/frag warhead with lethal capability against enemy fixed-wing and rotary-wing aircraft. Figure 3-6 shows the weapons loadout for an Apache AH-64. All of these systems are carried externally. As the Army transitions to higher speed rotorcraft, more aerodynamic designs will be required; effective means of internal carry must be incorporated into new platform designs.

949 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

Figure 3-6. Weapons Loadout for AH-64 Apache

The Black Hawk UH-60 is the Army's front line utility helicopter used for troop transport, air cavalry, aeromedical evacuations, and selected other missions. Lethal capabilities for most Black Hawks are provided by two pintle-mounted M60D or M240H 7.62mm machineguns located at the crew chief and gunner stations. The rate of fire for these weapons, which provide self-defense and fire-suppression capabilities, is about 600 rounds/min for the M60D and 750 rounds/min for the M240H. Their effective range is about 1100 meters.[29] Black Hawks fitted with the External Stores Support System (ESSS), which incorporates two stub wings each containing two hard points, provide significant potential for enhancing platform lethality by enabling deployment of an impressive array of additional armament. The enhanced lethal capabilities of such Black Hawks is reflected in the MH-60M Blackhawk, a highly specialized UH-60 variant developed for both assault and attack missions by Special Operations forces. The MH-60M is capable of carrying Hellfire missiles, air-to-air Stinger missiles, 70mm (2.75-inch) Hydra rockets, medium-caliber gun pods, or the Volcano minefield dispersal system. Additional armament can include two 7.62mm M134 Miniguns, forward facing, used for self-defense and landing zone fire suppression; the M134 is capable of firing up to 6000 rounds/minute and has an effective range of about 1000 meters.[30] Figure 3-7 shows an MH-60M Black Hawk firing a salvo of 2.75-inch rockets.

[29] Operator's Manual for Helicopters, Utility Transport, TM 1-1520-280-10, HQDA, 14 August 2009, Distribution D.

950 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

Figure 3-7. MH-60M Black Hawk Firing a Salvo of 2.75-inch Rockets

The primary mission of Chinook CH-47 aircraft is to provide transport of troops, artillery placement, and battlefield resupply of ammunition, fuel, water, barrier materials, and other supplies and equipment. Other missions may include medical evacuation, aircraft recovery, firefighting, parachute drops, heavy construction, disaster relief, and search and rescue operations. CH-47 lethality is provided by pintle-mounted M60D or M240 7.62mm machineguns mounted in the forward right cabin door, left cabin escape hatch, and at the rear loading ramp to provide self-defense and fire-suppression capabilities similar to the Black Hawk UH-60. As noted for the Black Hawk, the rate of fire for these weapons is about 600 rounds/min for the M60D and 750 rounds/min for the M240H, with an effective range of about 1100 meters for both weapons.[31] The accuracy of some of these guns may be enhanced by co-aligned IR and visible lasers. The IR laser is intended to be used with night vision devices.

Additional lethal capabilities provided by Army Aviation are associated with the current and potential future use of UAS, MUM-T, and DVE. Gray Eagle is currently the only unmanned aircraft system deployed by the Army that carries armament. The aircraft has four hard points that can carry Hellfire AGM-114 missiles that are particularly effective against enemy main battle tanks and other hard, high-value targets. They provide a lethality complement to Apaches while eliminating the risk to Apache aircraft and crew. Small UAS swarms, under consideration for future development, can add an exciting advanced capability to air/land combat operations when

[31] Technical Manual, Operator's Manual for Army CH-47F Helicopter, TM 1-1520-271-10, HQDA, 18 December 2013

951 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

new CONOPS and TTPs are developed to exploit their potential. UAS and coordinated MUM-T operations, discussed in Section 3.3 and including the SUMIT and CODE efforts, will also add a new facet to Army Aviation lethality. As previously noted, the AH-64E currently has the capability to control the Shadow and Gray Eagle flight path and payload. In addition to enhancing Army Aviation survivability, emerging DVE capabilities, discussed in Section 3.1.1, also offer important potential lethality benefits. The stated goal of the RDECOM/AMRDEC DVE-Mitigation (DVE-M) program is "to convert DVE into a combat multiplier," to create an advanced capability that enables commanders "to conduct operations deliberately in DVE with confidence" and ensure that their mission will be successful. DVE can provide a disruptive capability advance help "to maintain an asymmetric advantage on the battlefield, much like night vision technology."[32] Such an advantage will clearly enhance overall Army Aviation lethality.

Over the past decade, directed energy weapons have made significant technological advances in terms of power and effectiveness. One specific DE technology showing particular promise is optical fiber lasers, which are energy efficient, compact, and experiencing significant continuing technical advances. Such directed energy weapons have an "infinite" magazine and reach targets at the speed of light. It is important to note that both allies and potential adversaries have the technological capability to develop and field capable directed energy weapons, with both offensive and defensive applications. The Army should strategically plan for and embrace the future deployment of directed energy weapons on different types of Army Aviation platforms for both survivability and lethality purposes.

3.5 Platform Technology

3.5.1 Overview

The platform technologies S&T portfolio is designed to explore, develop, and transition critical technologies that enhance the performance, effectiveness, affordability, and survivability of Army Aviation. The ASB considers the portfolio to be generally well-balanced for manned systems; ongoing engine programs are especially well structured. There are two big-picture recommendations that clearly need to be implemented moving forward:

1. For manned systems, Army Aviation platform technologies must continue to be developed to support not only the modernization of the legacy fleet but also future vertical lift, especially in light of the ASB Recommendation Set #5, FVL with Speed and Simplicity. (See Section 4.5)
2. In light of the ASB Recommendation Set #3, UAS Vehicles, the platform technologies portfolio must be expanded and/or redirected to provide more focus on unmanned systems (see Section 4.3).

Five objectives have been laid out by AMRDEC for platform technologies that are designed to provide significant payoffs, including increased mission radius, increased payload capability, reduced O&S costs, decreased maintenance downtime, increased mission availability, and

[32] Kristofer Kuck, "RDECOM Rotorcraft DVE-Mitigation (DVE-M) Program," AMRDEC/ADD briefing to ASB, 17 March 2015.

952 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

improved crew protection/survivability. As mentioned earlier, the ASB considers this portfolio to be reasonably balanced for manned systems and, with proper focus, many of the efforts can support unmanned platforms as well. These five objectives are:

1. Improve the weight, noise, and durability and cost of rotorcraft drive systems;
2. Improve the power-to-weight ratio, specific fuel consumption, durability and cost of turboshaft engines;
3. Provide lightweight, durable, and reliable structures for extreme environments and high op-tempo scenarios;
4. Improve crashworthiness and aircrew protection from conventional threats and directed energy weapons;
5. Reduce sustainment costs by providing usage-based designs, health-based adaptive controls, prognosis-based inspections/maintenance scheduling, and reliable designs.

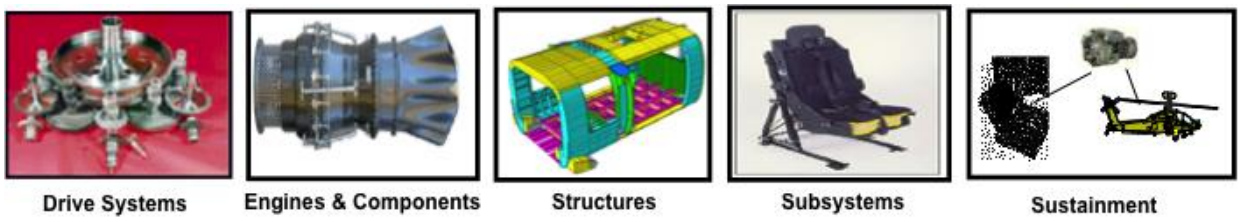

Figure 3-8. The Five Focus Areas for Army Aviation Platform Technologies

3.5.2 Drive Systems

Army Aviation's drive system S&T portfolio, described in Figure 3-9, consists of the Future Advanced Rotorcraft Drive System (FARDS) and the Next Gen Rotorcraft Transmission. As summarized in the figure, FARDS provides the aircraft drive train designers with a wide variety of validated approaches for significantly improving hp/wt ratio and reducing noise and cost compared to the existing fleet. These approaches are being achieved through advances in gearing, lubrication, housings, bearings and shafting, and materials. As the technologies mature, they are expected to transition to UH-60 and OH-58 upgrade programs.

The Next Gen Rotorcraft Transmission program is consistent with the Joint OSD Advanced Variable Speed Aircraft Transmission (AVSAT) program. Key program objectives are to demonstrate speed changing concepts (100-50% range), increase Oil Out Time by 50%, reduce O&S costs by 40%, and increase component life by 2000 hours. Transition targets are the current fleet as well as FVL. Figure 3-10 shows the Rotorcraft Drives Technical Area Roadmap.

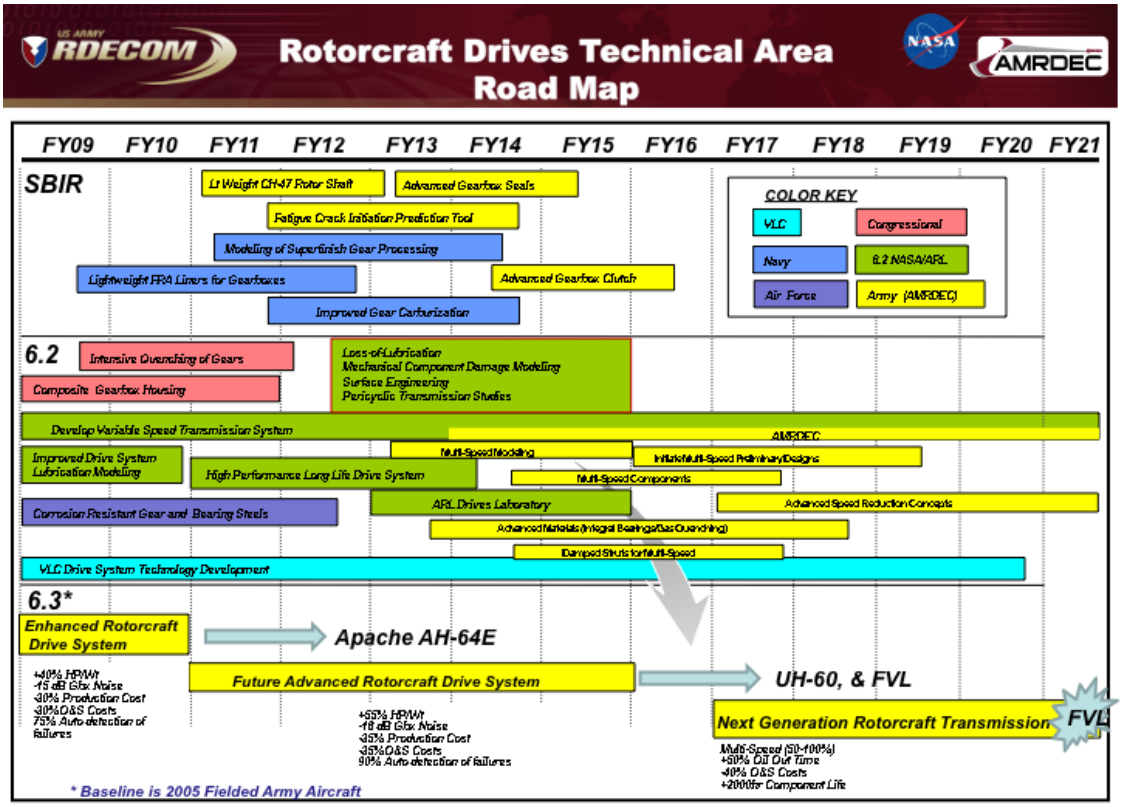

Figure 3-10. Rotorcraft Drives Technical Area Road Map

954 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

3.5.3 Engines and Components

The ASB is very supportive of the Army engine programs and believes that continuing participation in the ITEP/AATE/FATE/Alternative Concept Engine initiatives should remain a high priority. These programs are leading to superior mission capability for current and future rotorcraft, as well as for increased energy efficiency and significant O&S cost reduction, which is important since engines are the top rotorcraft O&S driver. Figure 3-11 provides an overview of the Army Engine Science and Technology initiative showing gaps being addressed and future engine attributes. Figure 3-12 provides an overview of engine technology development from component development at the 6.2 Applied Research level to engine/component qualification programs at the 6.4 Advanced Component Development and Prototypes level and on to transition to legacy aircraft and FVL. Figure 3-13 provides details on the AATE program from its purpose to develop advanced affordable 3000-hp class turboshaft engine technology for Black Hawk, Apache, and FVL aircraft to the payoffs of improved payload and hot/high engine capability, as well as reduction in production and maintenance cost and logistics footprint. An example of the superior mission capability that will be achieved for current rotorcraft is discussed in Section 4.4 Modernization of Legacy Rotorcraft Systems, where insertion of ITEP/FATE engine technology into a Black Hawk platform provides a dramatic increase in range/payload. The Army Engine S&T roadmap is also presented in Section 4.4.

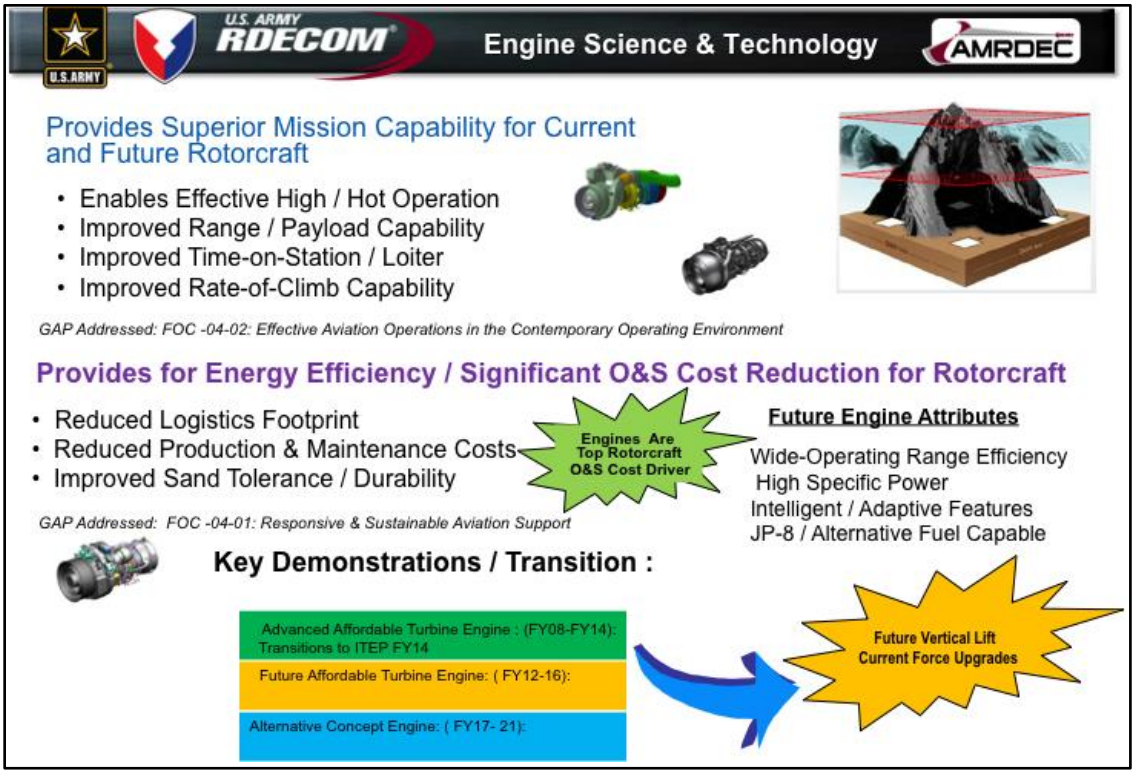

Figure 3-11. Army Engine S&T Showing Gaps Addressed and Future Engine Attributes

3.5.4 Structures, Subsystems, and Sustainment

AMRDEC has extensive platform programs focused on structures, subsystems, and sustainment that the ASB considers to be well-balanced for manned systems. Figure 3-14 presents the Structures S&T Roadmap out to FY2020, which shows how the structures S&T portfolio supports the JMR demonstrator. Figure 3-15 provides the Subsystems Roadmap with an overview of the subsystems portfolio, which has a strong focus on aircrew survivability technologies. Figure 3-16 provides the Operations and Sustainment S&T Roadmap extending from capability-based operations and sustainment to autonomous sustainment for rotorcraft operations, and finally moving toward embedded rotorcraft sustainment technologies. Information regarding the Army sustainment efforts in the context of condition-based maintenance and near-zero maintenance aircraft are provided in Section 3.2. Ongoing RDT&E activities pertinent to the development of CBM capabilities are summarized in Appendix E.

12. Aviation Systems Integration and Testbed

S&T Portfolio: Innovation and Game Changers

10. Advanced and Disruptive Systems S&T
11. S&T Investment Strategy

Figure 4-1. Findings and Recommendations Overview

4.1 System of Systems Operational Effectiveness Analyses

The critical challenge to Army Aviation posed by the proliferation of threats was discussed in Section 2. These threats span the spectrum from sophisticated next-generation air defenses to capabilities that utilize widely available inexpensive assets, such as swarms of small Unmanned Aircraft Systems (UAS). The continued advancement and proliferation of MANPADS and SAM systems is of particular concern. The current approach to survivability of Army Aviation systems is based on a multi-layered approach centered on the platform. The outer layer involves systems and techniques to avoid detection by a threat system, the next layer to avoid engagement by the threat, and so on. This "onion" approach has served well in the past. However, next-generation threats, and the proliferation of these advanced threats, calls into question how much longer this platform-centric approach can remain effective.

One approach to solving this platform-centric dilemma is a system-of-systems (SoS) concept, which effectively adds another layer to the "onion" outside of the platform itself. A limited number of elements of the SoS concept are already being implemented by means of the fusion of off-board information with on-board data and the recent upgrade of AH-64 to include Level 4 MUM-T capability with Shadow. However, a more robust vision for the future that takes fuller advantage of collaboration between manned and unmanned systems is required to drive SoS solutions that fully exploit the synergy of unmanned systems operating in collaboration with the manned platform at the center of the "onion." Supervised semi-autonomous UAS can provide another layer to the onion.

Based on these findings, the first study recommendation is to conduct an SoS operational effectiveness analysis, as detailed in Figure 4-2. This analysis will result in a definition of the future

959 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

Army Aviation architecture and CONOPS for effective operations against the intense threat environment that exists now and that will only become more challenging in the 2025-2040 timeframe. This analysis must consider and fuse all elements of the Joint integrated battlespace illustrated in Figure 4-3. All other recommendations of this study are dependent upon a firm foundational knowledge of the architecture and CONOPS resulting from this analysis.

Findings

- Increasing threat sophistication and proliferation (e.g., missiles, UAS, cyber, and directed energy) pose critical concerns. (Classified annex provides additional details)
- Platform-centric survivability must evolve to a manned-unmanned system-centric approach with new CONOPS and TTPs.
- A system of systems architecture should include manned-unmanned teaming, supervised autonomous systems, and secure communications.

Recommendation

- TRADOC: Conduct operational effectiveness analyses of potential system of systems concepts in a cost-constrained environment that address capability gaps for Army Aviation in 2025 and beyond in complex threat environments. Concepts should include holistic air-ground approaches, high/low mixes of collaborative manned/unmanned systems, FVL performance characteristics, higher levels of autonomy, PNT in GPS-denied environments, attritable UAS assets and enhanced lethality of DE. Develop CONOPS and architectures for the most cost-effective concepts.

Figure 4-2. Findings and Recommendation Set #1

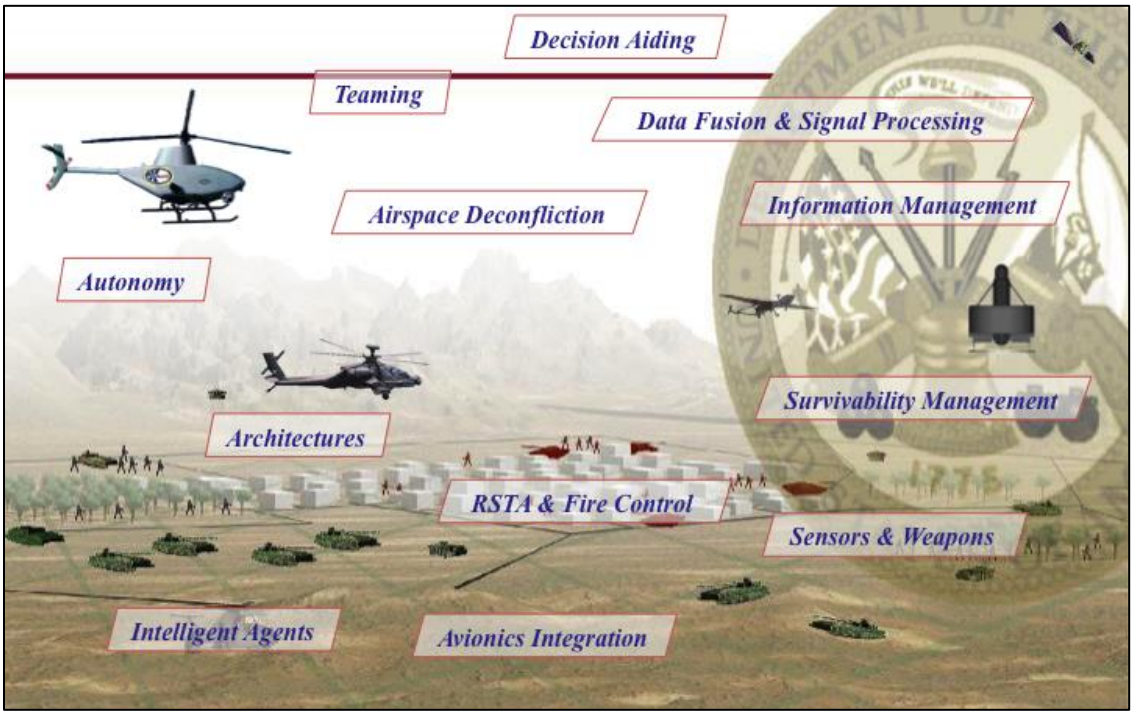

Figure 4-3. Notional Integrated Battlespace

960 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

4.2 Affordability of Heavy Vertical Lift

The pressing challenge for Army Aviation systems to satisfy the need for strategic, expeditionary, and operational maneuver of dispersed mechanized forces in austere areas of operation in the face of capable anti-access and area denial (A2/AD) threats in future conflicts was discussed in Section 2. Current Army Aviation assets cannot provide the heavy vertical lift (20-30 stons) needed for expeditionary and operational maneuver of *mechanized* dispersed forces. This need has been detailed in numerous studies, exercises, and wargames, including the 2014 Army Unified Quest exercises,[33] the 2014 ASB study on Strategic and Expeditionary Maneuver,[34] and the 2012 Army-Marine Corp Concept.[35] The capability needs for this class are documented in the Joint Future Vertical Lift (JFVL) ICD as well as the Joint Heavy Lift (JHL) ICD.

Figure 4-4. Historical Heavy Vertical Lift Options

While the capability need for a vertical heavy lift system is well documented, it is clear that the Army cannot afford to develop such a capability within current or anticipated Army TOA for the foreseeable future. Therefore, the Army may have to rely on interim solutions to providing a partial capability (see Figure 4-4). The recommendation resulting from these findings, detailed in

[33] Army Capabilities Integration Center, *Unified Quest 2014 Executive Report,* 12 Mar 2015, http://www.arcic.army.mil/Library/documents.aspx.

[34] Army Science Board, *ASB FY2014 Summer Study - Decisive Army Strategic and Expeditionary Maneuver,* July 2014.

[35] Army Capabilities Integration Center and Marine Corps Combat Development Command, *Gaining and Maintaining Access: An Army-Marine Corps Concept*, Mar 2012.

961 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

Figure 4-5, calls for TRADOC to reassess interim and future Joint heavy vertical lift options to determine a viable road ahead.

Findings

- Heavy vertical lift (20-30 stons) is required by the Army CONOPS for expeditionary and operational maneuver, validated by JROC (documented in the FVL and JHL ICDs) and supported by Unified Quest 2014, and "2012 Gaining and Maintaining Access: An Army-Marine Corps Concept."
- However, development of a new system is cost prohibitive within likely future Army modernization (RDA) funding before 2040.
- Interim solutions able to provide more limited capability are available (e.g., CH-53K at 18 stons, and Joint Precision Air Drop System – JPADS) and could provide viable options.

Recommendation

- TRADOC: Assess interim and future HVL options for meeting Army CONOPS and documented JCIDS capability needs for expeditionary and operational maneuver and recommend road ahead
  - If development of HVL is cost prohibitive, consider alternatives.
  - If there are no plans for HVL, do not assume it is available in analyses, wargames, and exercises.

Figure 4-5. Findings and Recommendation Set #2

4.3 UAS Vehicles

As discussed previously in Section 2, UAS can and should play a significant and expanded role in future Army Aviation CONOPS. Although the Army UAS Roadmap[36] cites plans to upgrade current platforms and eventually to develop replacements for some, it lacks a clear vision for expanding the use of UAS as complements and extensions to manned aviation, rather than simply as stand-alone single mission (ISR) systems. Expanding the mission set and increasing autonomy for UAS are identified as far-term objectives in the roadmap, but very limited funding is currently allocated to achieving these objectives. In contrast to the Army Aviation UAS roadmap, the USAF and USN/USMC have bold visions for expanded roles/missions for UAS and greater use of collaborative MUM-T.

The rapidly advancing technologies associated with UAS, autonomous systems and MUM-T should be viewed as a significant opportunity for Army Aviation to better integrate collaborative manned-unmanned capabilities into its future force. Concepts similar to the distributed functionality SoS concept in Figure 4-6 are critically important to the survivability and lethality of Army Aviation and require a focus on introducing new UAS designs into the Army Aviation inventory and effectively integrating these new assets into a collaborative manned-unmanned environment. A major challenge in expanding the Army Aviation UAS portfolio, increasing MUM-

[36] US Army UAS Center of Excellence, "*Eyes of the Army," U.S. Army Unmanned Aircraft Systems Roadmap 2010-2035*, 2010, http://www-rucker.army.mil/usaace/uas/us%20army%20uas%20roadmap%202010%202035.pdf .

962 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

T capabilities, and meeting a bold vision, however, is the small percentage of Army S&T funding allocated to UAS developments.

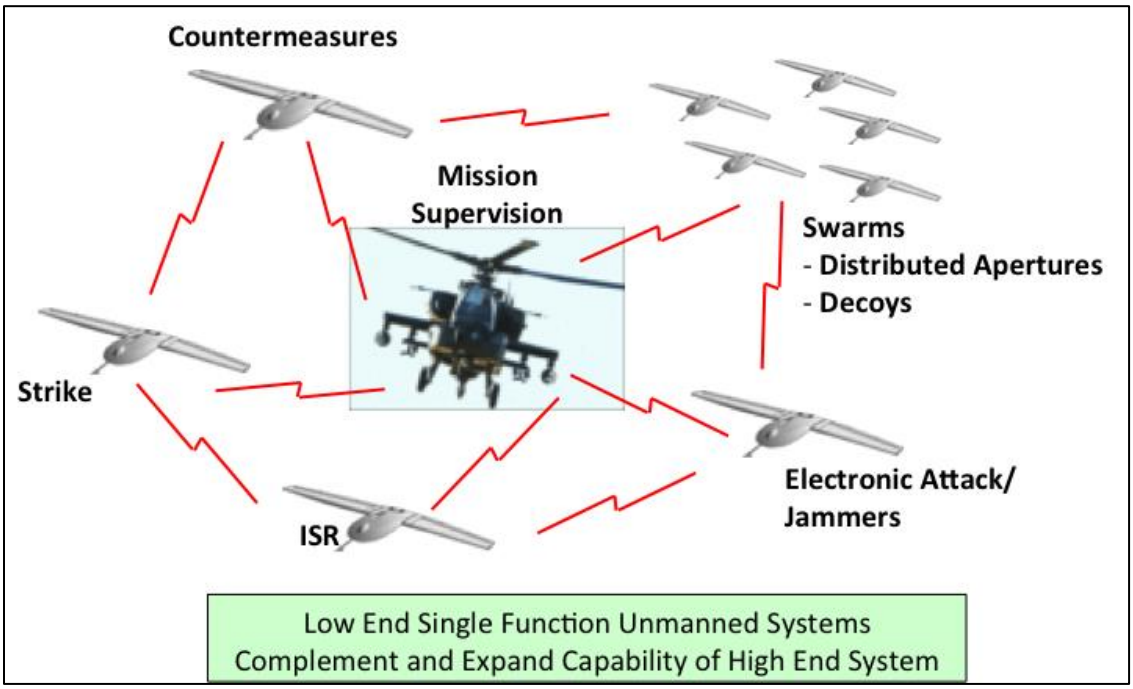

Figure 4-6. Distributed Functionality Collaborative System of Systems Concept

The ASB recommendation in this area, detailed in Figure 4-7, is for ASA(ALT) to review and revise the UAS roadmap as necessary to identify and embed near-term and future UAS that are capable of satisfying the Army Aviation SoS architecture and CONOPS that will emanate from the SoS operational effectiveness analysis (Recommendation Set #1).

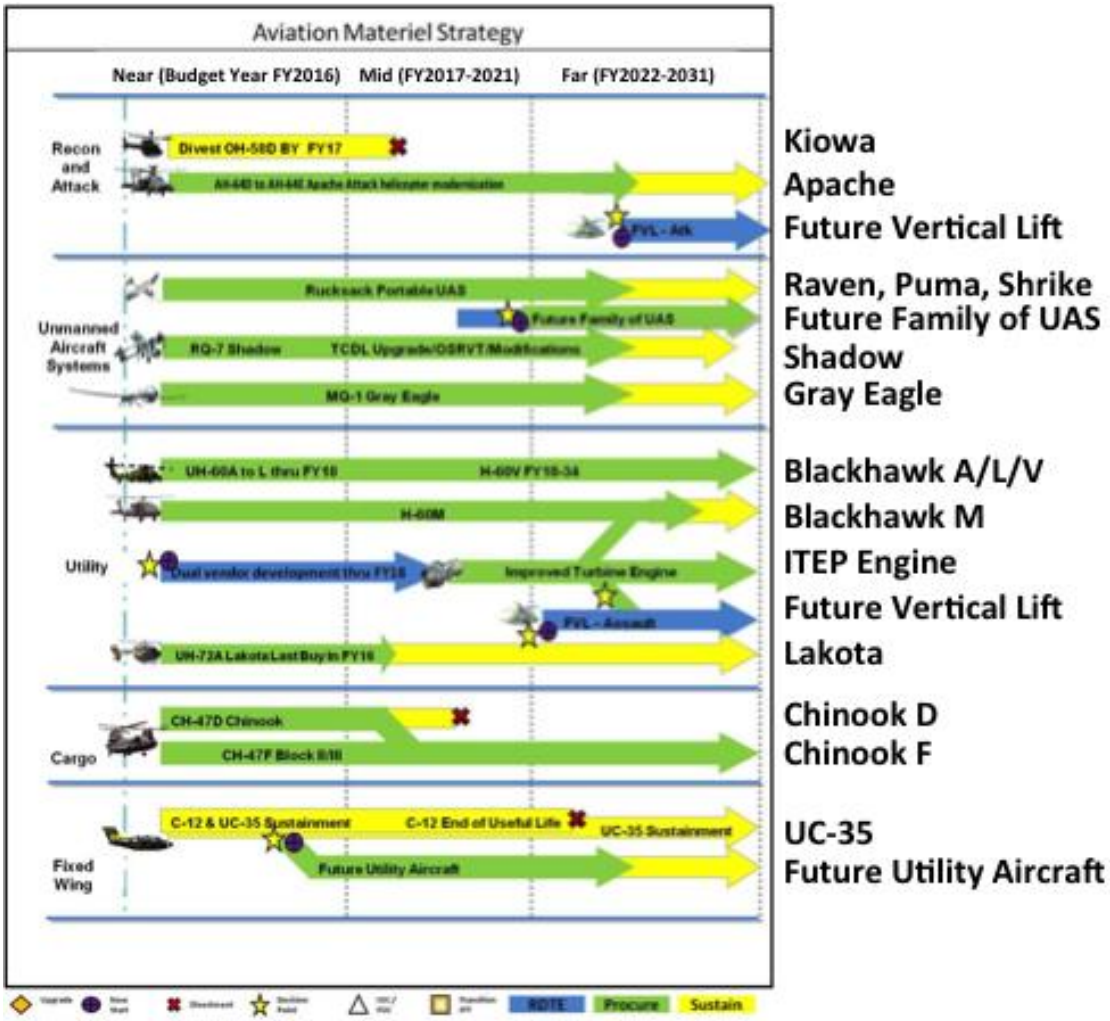
Findings

- The USN/USMC and USAF have strong visions for the expanding role of UAS and manned-unmanned teaming in aviation missions.
- DARPA, USN/USMC and USAF are investing in next generation UAS technology options that offer potential capability for Army Aviation.
- New UAS are needed to fully exploit manned–unmanned synergy and collaboration of manned systems with supervised autonomous systems within a system-of-systems architecture.

Recommendation

- ASA(ALT): Revise UAS Roadmap to expand near-term and future UAS vehicle options, some of which should be compatible with speed, hover, and range of current and future manned aircraft, with attributes compatible with distributed functionality among UAS (ISR, Lethality, …) as informed by the results of system of systems operational effectiveness analyses (Recommendation Set #1)

Figure 4-7. Findings and Recommendation Set #3



963 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

4.4 Modernization of Legacy Rotorcraft Systems

Army Aviation is continually faced with the challenge of trying to achieve an optimal balance of its R&D investments committed to modernizing/upgrading legacy rotorcraft platforms and developing new systems that offer expanded performance capabilities and reduced sustainment compared to current systems. The Future Vertical Lift (FVL) Family of Systems (FoS) represents the future of Army Aviation manned (and optionally manned) rotorcraft systems. FVL is currently an initiative within the Army Aviation S&T portfolio and is not expected to become a Program of Record (POR) until after the current Program Objective Memorandum (POM). Therefore, if the program were to follow normal DoD acquisition processes for an ACAT I Major Acquisition Program and the Planning, Programming, Budgeting and Execution (PPBE) processes, an Initial Operating Capability (IOC) for FVL would not be expected until the mid-2030s. After IOC, at historical Army Aviation procurement funding levels, it will take roughly 30-40 years to replace the legacy platforms.

It is expected, therefore, that legacy rotorcraft systems (AH-64, CH-47 and UH-60), which are all 1960-1970 vintage designs, will remain deployed until at least 2060. This century-long platform life would be rivaled only by the B-52 bomber, which has been re-purposed from its original mission to extend its utility. These Army rotorcraft platforms have undergone several upgrades over their lifetimes, and the Army plans to continue modernization of these platforms until FVL is deployed (Figure 4-8).

964 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

Source: Army Equipment Program in Support of President's Budget 2016.

Figure 4-8. The Army Plans to Retain Legacy Systems Far Into the Future

However, since it will take several decades of FVL procurement to replace all legacy platforms, at least one more major upgrade to these systems will be required beyond those currently in progress or funded within the POM for them to remain operationally effective against the evolving threat. Fortunately, several significant technology initiatives within the Army Aviation S&T portfolio apply to both legacy and future manned systems. These technologies include ITEP/FATE engine insertion, DVE capabilities, CBM/PHM capabilities, ASE improvements, and greater MUM-T. The RDECOM advanced aircraft engine program (see Figure 4-9) is a perfect example of the type of dual-purpose technology program that yields benefits to both future and legacy aviation systems. The operational utility of inserting ITEP/FATE engine technology into a legacy system is illustrated in Figure 4-10 by the dramatic increase in range/payload of the Black Hawk platform. The vertical dashed line (at a radius of 200 km) in the figure illustrates a doubling of payload capacity in transitioning from the current engine to the ITEP engine.

965 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

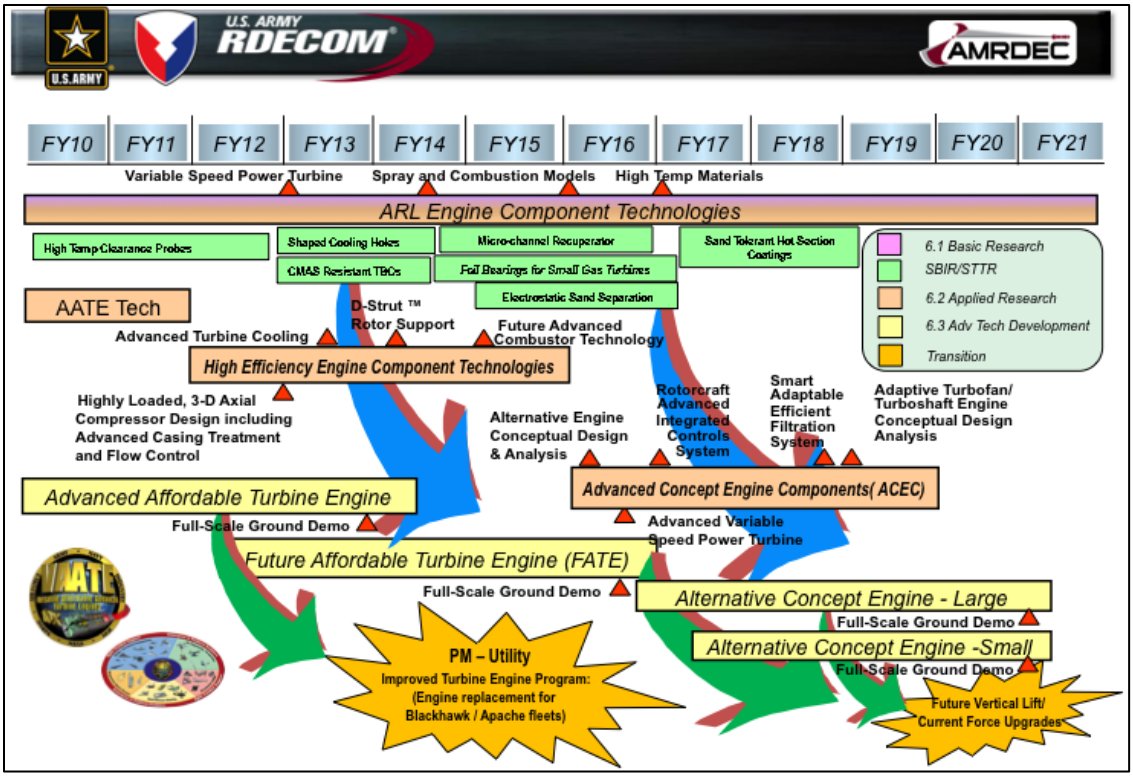


Figure 4-9. Army Aircraft Engine S&T Roadmap

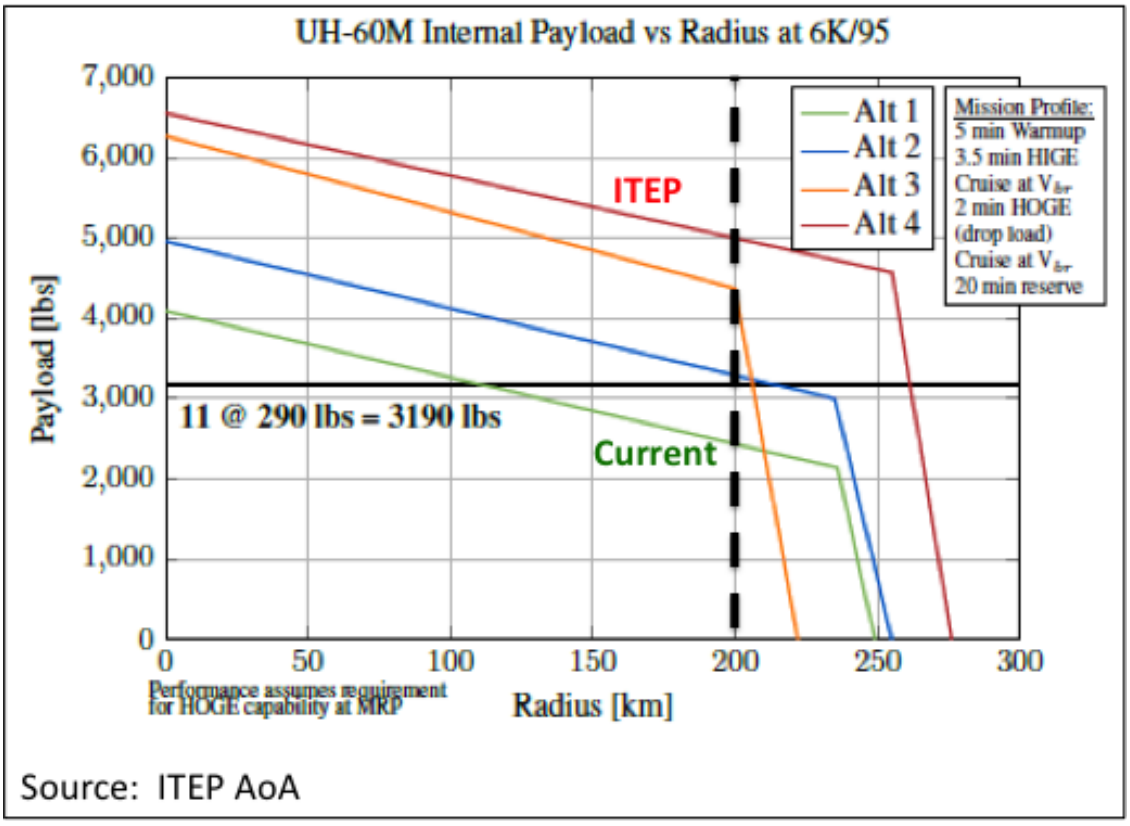

Figure 4-10. ITEP Provides Significant Improvement in Performance of Legacy Platforms

966 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

The recommendation resulting from these findings, detailed in Figure 4-11, is to continue S&T investment in dual use technology programs that benefit legacy systems as well as FVL.

Findings

- Legacy rotorcraft systems (AH-64, CH-47 and UH-60) are expected to remain deployed until at least 2060, requiring modernization investment.
- Within the current limited budget, Army Aviation S&T is investing in technologies that apply to both legacy and future manned systems.
- These technologies include: ITEP/FATE engine insertion, DVE capabilities, CBM/PHM capabilities, ASE improvements, and greater MUM-T.

Recommendation

- ASA(ALT): Continue S&T and road-mapping efforts for modernizing legacy systems with emphasis on those technologies that are also applicable to future aircraft, as informed by the results of system of systems operational effectiveness analysis (Recommendation 1).

Figure 4-11. Findings and Recommendation Set #4

4.5 FVL Acquisition with Speed and Simplicity

The current FVL schedule, which is driven by funding constraints as well as technology maturation, does not lead to an IOC of the *first FVL* variant (most likely the FVL-Medium replacement for either AH-64 or UH-60) until the mid-2030 timeframe (see Figure 4-12). After IOC, given anticipated procurement budget constraints, it will take a decade or two to replace the legacy system. It must be emphasized that this schedule applies only to the first FVL variant. Funding constraints will limit development, test and procurement of the second and third variants to later timeframes. The study team noted that an opportunity exists to perform an Analysis of Alternatives (AOA) between MDD in October 2016 and Milestone A in 2019. Flight data would be collected during this period to support the AoA.

967 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

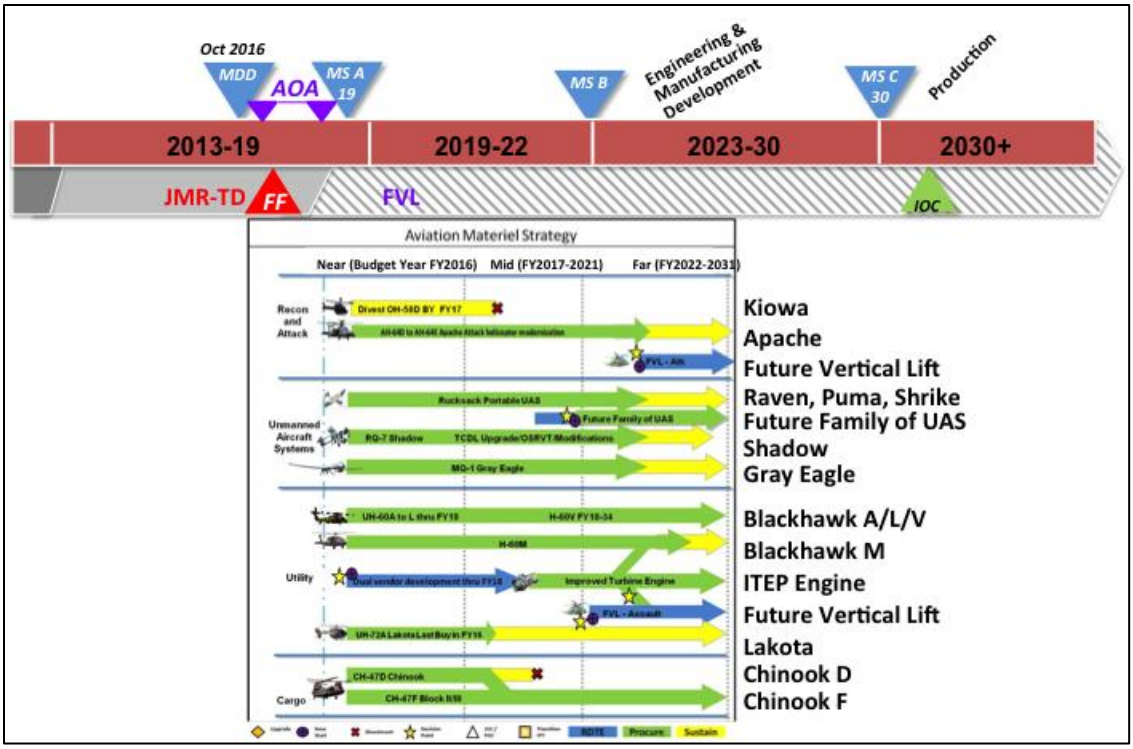

Figure 4-12. FVL – First Aircraft Timeline

Affordability of FVL is needed to deal with limited funding. Affordability, in turn, is driven by requirements. As the only new aviation program on the horizon, FVL will be pressured by the operational community to have system and performance requirements that satisfy every possible operational need. Lack of requirements discipline is one leading cause of acquisition program failure. FVL will be no exception if the requirements process is not tightly managed and constrained. An approved DoD acquisition process, known as evolutionary acquisition, could prove to be of great value in managing requirements growth and in accelerating the introduction of FVL into the fleet. Under this acquisition strategy, the operational and acquisition communities would agree on a set of objective performance requirements, but also agree on a more limited set of these objectives that could provide an effective early operational capability. Pre-planned capability upgrades leading to the full set of objective requirements would also be defined. Such an approach would help not only to manage requirements but also accelerate IOC for a limited capability.

Such acceleration, however, is dependent on technology maturity. In addition to unrealistic requirements and/or requirements growth, unrealistic evaluations of technology maturity is the other most significant cause of acquisition program failure. Fortunately for FVL, due to major industry investment, the JMR-TD demonstration vehicles will have greater fidelity and be more representative of the FVL-Medium operational design than would normally be expected. Parallel investments in the FACE/JCA open system architecture could provide the technology basis for some acceleration of a Milestone B DAB.

968 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

An acceleration of the FVL program would also be of significant benefit to the health of the US rotorcraft industry, which has eroded over the past several decades due to the lack of military development programs. It should be remembered that the backbone platforms of the Army rotorcraft fleet (i.e., UH-60, AH-64 and CH-47) are all essentially 1960-1970 vintage designs and developments. The decline of US market share in the commercial helicopter market provides evidence that US leadership in rotorcraft system design and development is eroding. As indicated in Figure 4-13, the total share of US industry *combined* is only 25%, while the two European companies, Airbus Helicopters and Augusta Westland, have almost 60% of the world market.

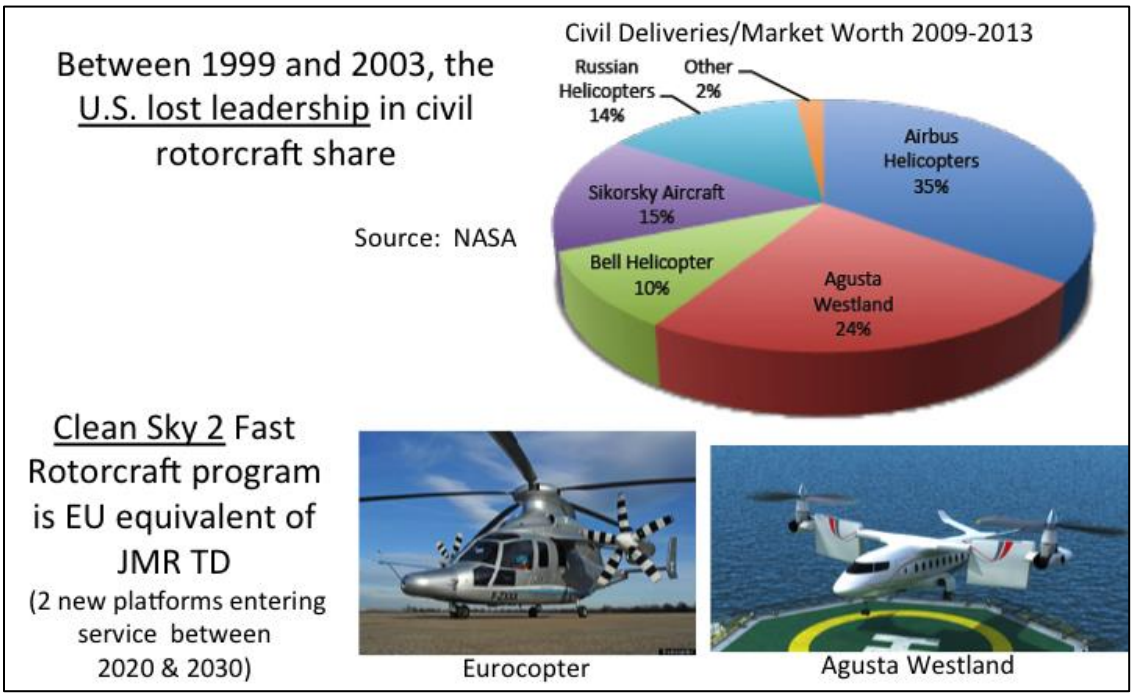

Figure 4-13. Worldwide Competition

Among the programs being sponsored by the European Union is the Clean Sky 2 Fast Rotorcraft Program, which has performance attributes similar to FVL and which is building two prototypes very similar to JMR-TD. A robust US rotorcraft industry is essential for the future of Army Aviation, but that is certainly not assured in this global environment.

These findings lead to the recommendation, detailed in Figure 4-14, that ASA(ALT) should develop an evolutionary acquisition approach for FVL to allow for earliest possible fielding of a new rotorcraft consistent with budgetary realties.

969 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

Findings

- JMR-TD and FVL provide focus for Army Aviation S&T for next generation rotorcraft systems and provide a solid basis for much needed capability improvements (Ref. FVL ICD); however, there is no funding for FVL in the POM.
- The JMR-TD vehicles are close in size and aerodynamic performance capability to the FVL medium class system.
- The current FVL schedule leads to an IOC of the first system in the mid-2030s. It should be beneficial to accelerate this timeline through an evolutionary acquisition approach if funding allows.
- The JMR-TD, DARPA X planes, USN/USMC prototyping efforts, and industry investment support talent development and retention in rotorcraft government and industry teams.

Recommendation

- ASA(ALT): Develop an evolutionary acquisition approach for FVL to allow for earliest possible fielding consistent with funding constraints, as informed by the results of system of systems operational effectiveness analyses (Recommendation Set #1).

Figure 4-14. Findings and Recommendation Set #5

4.6 Aviation Mission Systems

RDECOM has numerous S&T efforts ongoing at AMRDEC, CERDEC, ARDEC, and ARL aimed at improving the mission system capabilities of Army Aviation systems. The majority of these efforts focus primarily on manned aviation systems, either for upgrading legacy systems or toward providing the technology base for future systems (i.e., FVL). That balance extends across all areas affecting affordability and mission effectiveness (e.g., lethality, survivability, sustainability, and maintainability), as well as all subsystems (e.g., airframe, power, propulsion, sensors, avionics, secure communications and networks, weapons). A much smaller portion of the RDECOM S&T portfolio is dedicated to unmanned systems, including several projects that advance state-of-the-art of autonomy, compatible mission systems, and manned-unmanned teaming (see Section 3.3). Many of the S&T projects, however, while aimed primarily toward manned or optionally manned systems, in fact have dual applicability to unmanned systems as well. For example, much of the CERDEC sensor and ASE development work is equally applicable to manned and unmanned systems.

Of particular note for potential dual use is the Degraded Visual Environment (DVE) work being conducted by AMRDEC and CERDEC. Focused principally on providing the means for manned rotorcraft systems to operate safely in a variety of degraded visual environments (see Figure 4-15), the effort includes the development of modern control laws to improve flight control in legacy systems. These techniques can support automated flight modes that enable capabilities such as terrain and obstacle avoidance and automated safe landing modes also applicable to unmanned systems. In addition, one of the objectives of the project is to demonstrate multi-ship networking, illustrated in Figure 4-16, which could support the distributed functionality manned-unmanned teaming concepts previously discussed in Section 4.3.

970 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

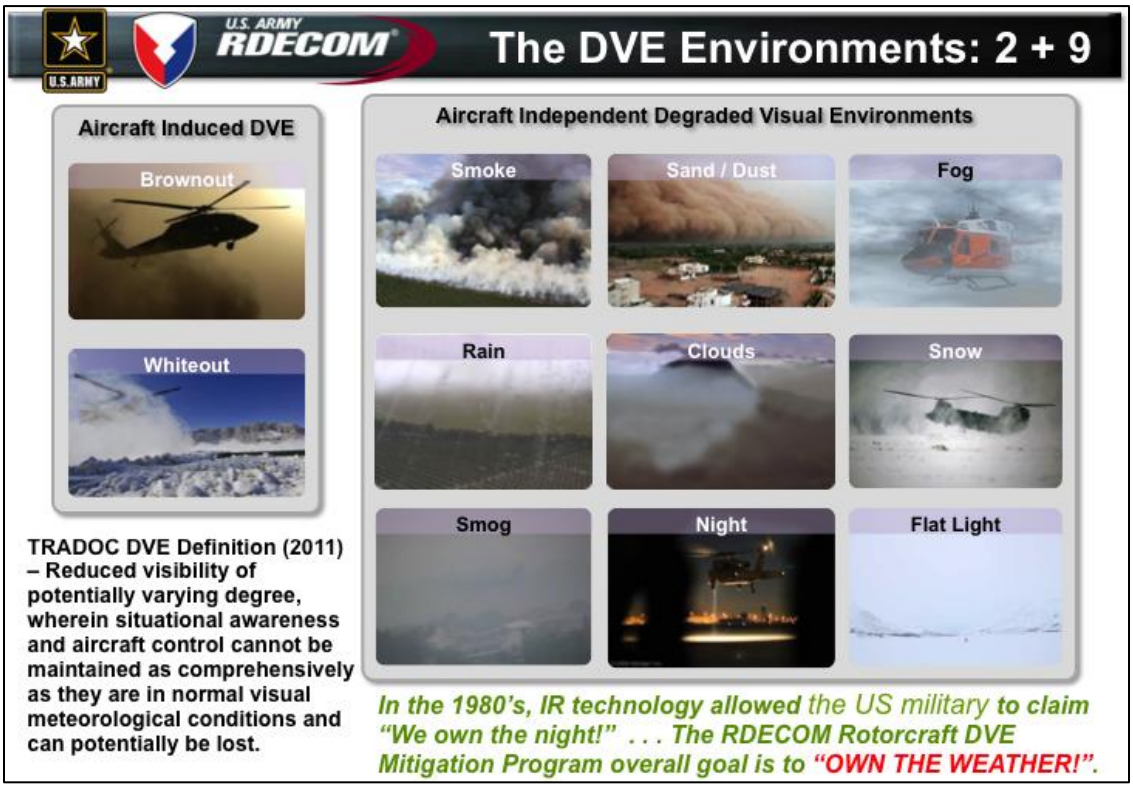

Figure 4-15. RDECOM DVE

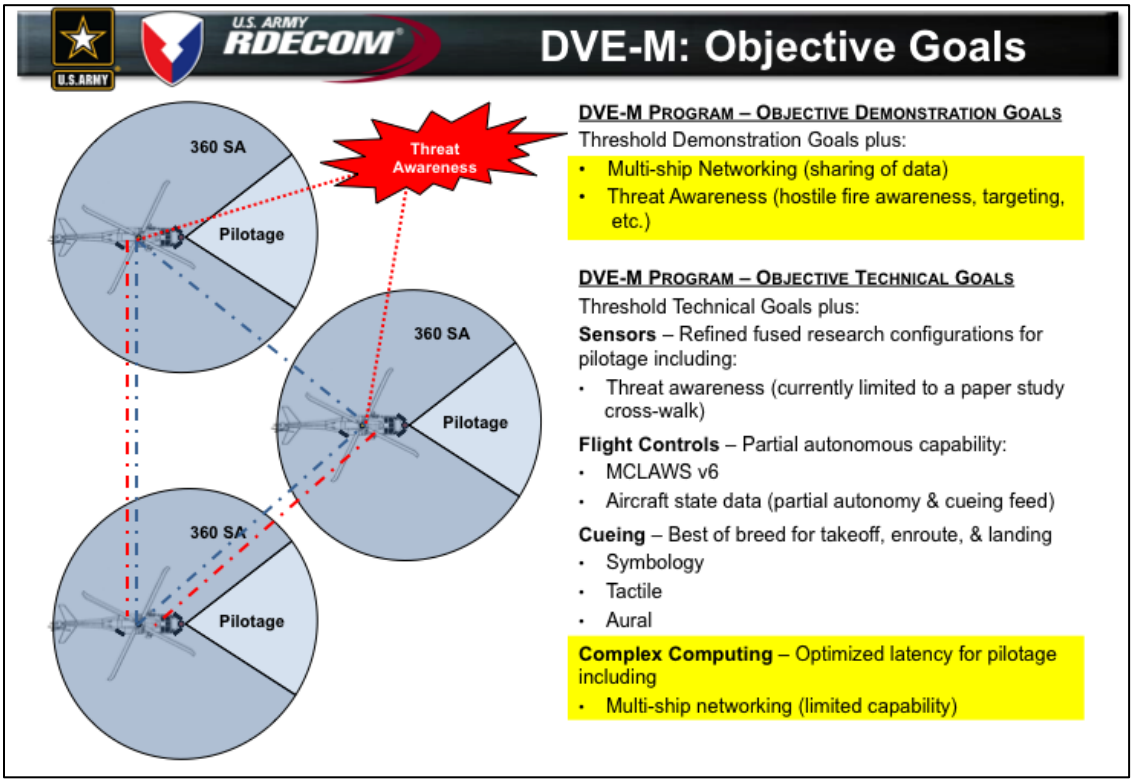

Figure 4-16. DVE-M Objective Goals

971 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

The mission systems work is vital to the future of Army Aviation and exploits much of the unique rotorcraft modeling, simulation and test facility capabilities that are resident within the Army S&T community by virtue of the Army's role as the DoD lead for rotorcraft systems. The recommendation in this area, included in Figure 4-17, is to expand mission system technology development, currently focused on DVE, to enable advanced formation concepts in future manned and unmanned platforms, and legacy platforms as appropriate, as informed by the results of system of systems operational effectiveness analyses (Recommendation Set #1).

Findings

- Army S&T mission system programs include Lethality, Survivability, Teaming & Autonomy, Human-System Interface, Avionics, and Networks.
- RDECOM DVE goals are appropriate and feasible - Progress at AMRDEC, CERDEC, and ARL in sensors, flight control, cueing, computing, and networking.
- Reduced pilot workload arising from DVE technologies should increase operational mission capacity (e.g., formations with UAS).
- Advanced sensors (e.g., IR, visible, and hyperspectral) are being developed.
- Additional advanced mission systems (e.g., offensive and defensive directed energy) and open system architectures are needed.
- DoD provides singular modeling and wind tunnel capabilities (NASA Ames)

Recommendation

- AMRDEC/ADD: Expand mission system technology development, currently focused on DVE, to enable advanced formation concepts in future manned and unmanned platforms, and legacy platforms as appropriate, as informed by the results of system of systems operational effectiveness analyses (Recommendation Set #1).

Figure 4-17. Findings and Recommendation Set #6

4.7 Aviation Systems Integration and Testbed

The system-of-systems concepts likely to emerge from the operational effectiveness analysis (Recommendation Set #1) will require an extensive modeling, simulation, experimentation and testing capability to validate operational utility, as well as to ensure that the system elements are well integrated. This capability requires an integrated aviation systems testbed, which may include M&S, laboratory prototype bench testing, operationally realistic prototype demonstrations, and SoS field experimentation in which elements interface and integrate under realistic operational conditions. Such an integrated testbed does not currently exist. However, some critical elements exist or are in development upon which the integrated capability could be built. The geographical distribution of these elements presents an integration challenge, which will rely on networking capabilities for real-time interaction when necessary.

Foundational to the testbed are the core capabilities resident within AMRDEC for the M&S, test and evaluation of rotorcraft systems. The AMRDEC and NASA wind tunnel facilities are national assets for both Government and industry testing of design concepts and validation of computer design/evaluation codes. The rapid prototyping capabilities within AMRDEC for flight demonstration and testing of advanced subsystems and components on rotorcraft test assets is

972 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

also a critical element for an integrated testbed. It is also possible that the JMR-TD demonstration vehicles could be utilized for prototyping demonstrations after the JMR flight test objectives have been completed.

CERDEC has a variety of world-class laboratories for aircraft survivability testing and evaluation that are important elements of the integrated testbed. Among these are anechoic chambers, seeker countermeasures effectiveness hardware-in-the-loop facilities, and several aircraft survivability equipment laboratories. CERDEC has a future vision for holistic integrated air and ground survivability capability that would facilitate the development of system and system-of-systems applications that enable intelligent integration of survivability systems that would progress beyond platform centric survivability (see Figure 4-18) to system-of-systems solutions (Figure 4-19). The proposed Future Holistic Adaptive Survivability Technology (FHAST) project that would develop a state-of-the-art suite of integrated electronic warfare capabilities to protect air and ground platforms from emerging threats would be a significant step toward the integrated testbed capability.

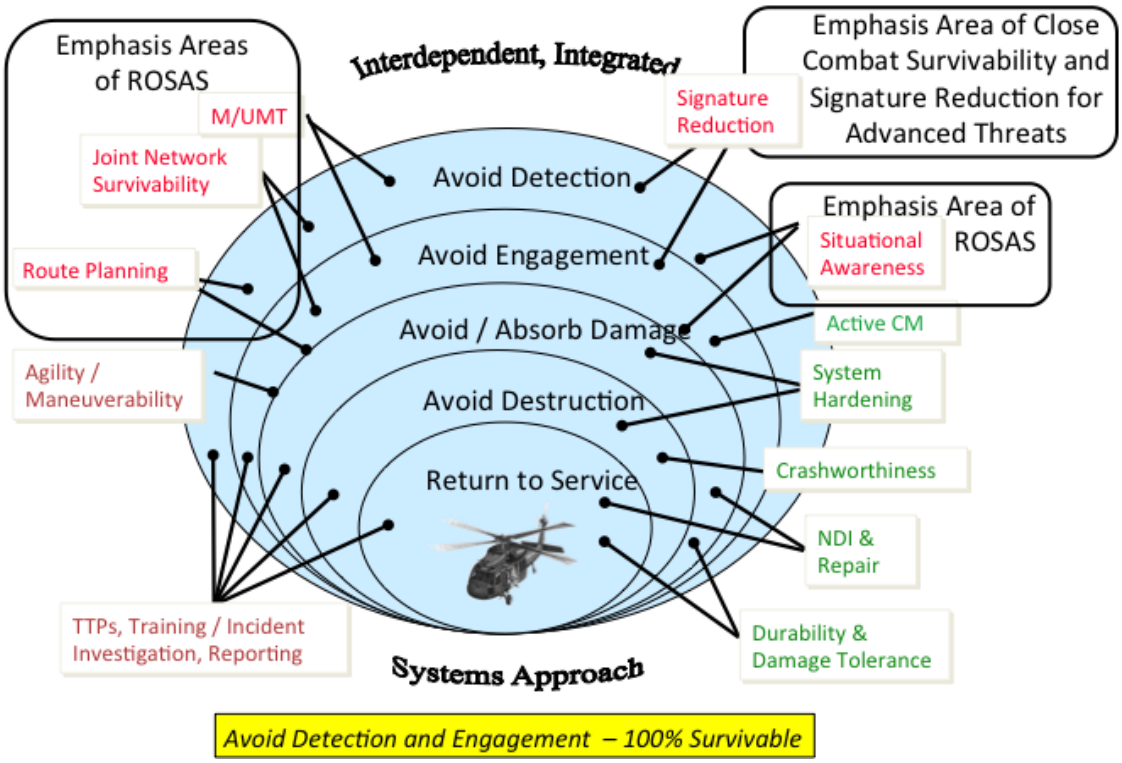

Figure 4-18. AMRDEC Total Survivability Paradigm – Platform-Centric

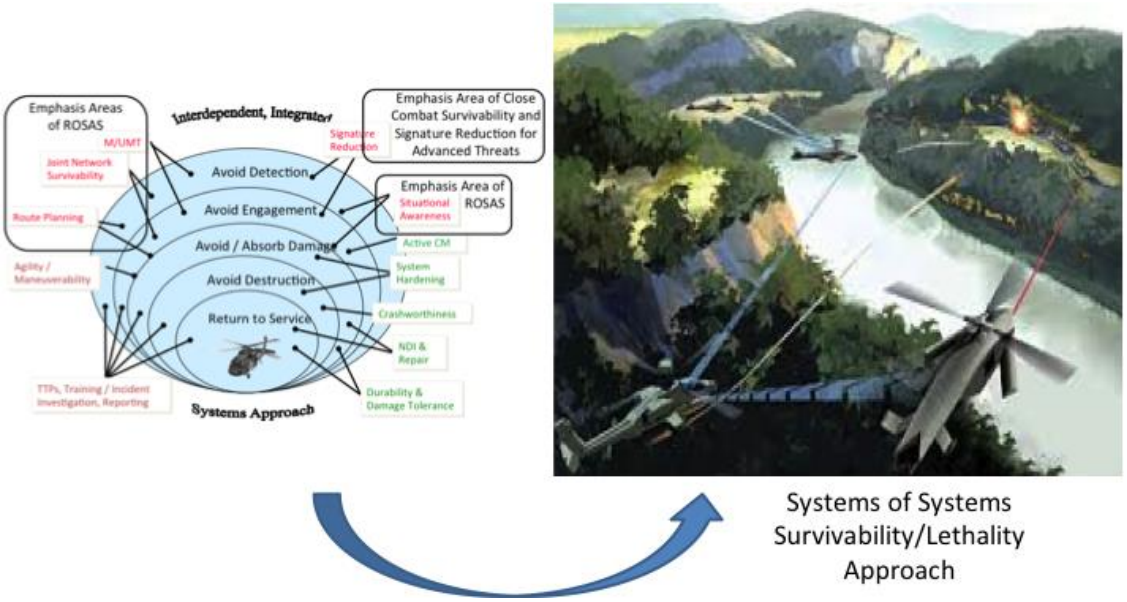
973 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING



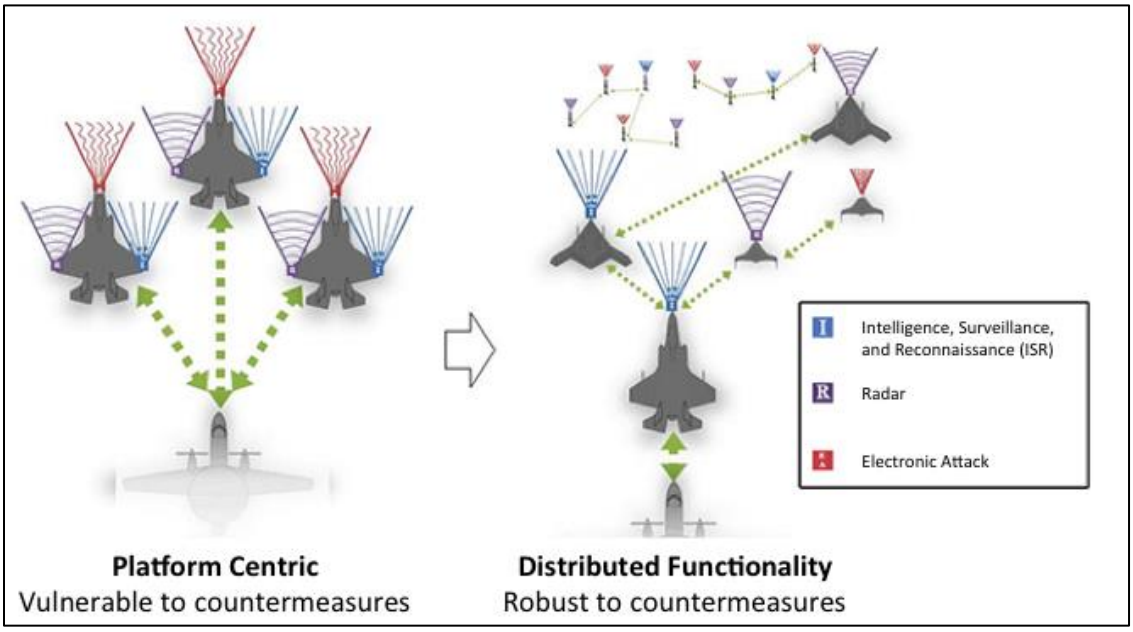


Figure 4-19. Total Survivability from System-of-Systems Perspective

DARPA can also contribute to the integrated testbed by means of its system-of-systems M&S capabilities that are being utilized to examine SoS concepts, such as the SoSITE project, illustrated in Figure 4-20.

Source: DARPA SoSITE Website

Figure 4-20. System of Systems Example

The recommendations emanating from these findings, detailed in Figure 4-21, are for RDECOM to pull together the building blocks to develop an integrated aviation testbed.

974 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

Findings

- Concepts developed in Recommendation 1 and new technical capabilities referenced in Sections 2-6 (individually and as integrated systems) will require extensive testing.
- Some initial work is found in CERDEC I2WD open systems efforts and DARPA's System of Systems Integration, Technology and Experimentation (SoSITE).
- Fully integrated joint vision for aviation in DoD is not evident. Coalition environment should be considered.

Recommendations

- RDECOM: Build the components of an integrated "survivable" system (MUM-T, attritable assets, secure comms, PNT, open operating systems, autonomy, high/low mix, distributed functions across future "formations").
- RDECOM: Building on Recommendation 1 and Sections 2-6, develop an aviation integration testbed for experimentation and validation of technology, prototypes, and concepts. Potentially include demonstration (such as JMR TD), prototype, surrogate, and operational systems.

Figure 4-21. Findings and Recommendations Set #7

4.8 Advanced and Disruptive Systems S&T

Army Aviation is at a crossroads of opportunity and challenge – opportunities to be found in emerging technologies that will enable significant advances in aviation and challenges posed by technology advances and availability among our adversaries. In the current climate, information about many emerging technologies and new applications of technology is available to everyone with an Internet connection.

In order to leverage technological opportunities and avoid technological surprise, it is essential for Army S&T to address leap-ahead technologies that support Army Aviation. As illustrated in Figure 4-22, there are several areas of innovation currently being addressed, sometimes by other Services and agencies. For example, the DARPA X-Plane effort is evaluating new rotorcraft technologies to achieve higher speed, and numerous organizations, including the Army, are exploring directed energy options. The Navy is examining the utility of UAS swarms, and the Air force is investigating air-launched UAVs. The Army must ensure that it is positioned to incorporate new concepts having significant potential to improve platform performance and reliability as well as to exploit unmanned aerial vehicles and manned-unmanned teaming to full advantage.

In particular, a shift toward a formation of unmanned systems controlled by a manned aircraft offers significant promise toward reducing the overall risk and cost of selected missions. If single-purpose UAS (e.g., ISR, strike, electronic warfare, or comms) can be used as illustrated in Figure 4-23, each asset is less costly than if every platform is designed to perform all functions. Even if one asset is lost, the remaining assets can continue to carry out the mission.

975 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

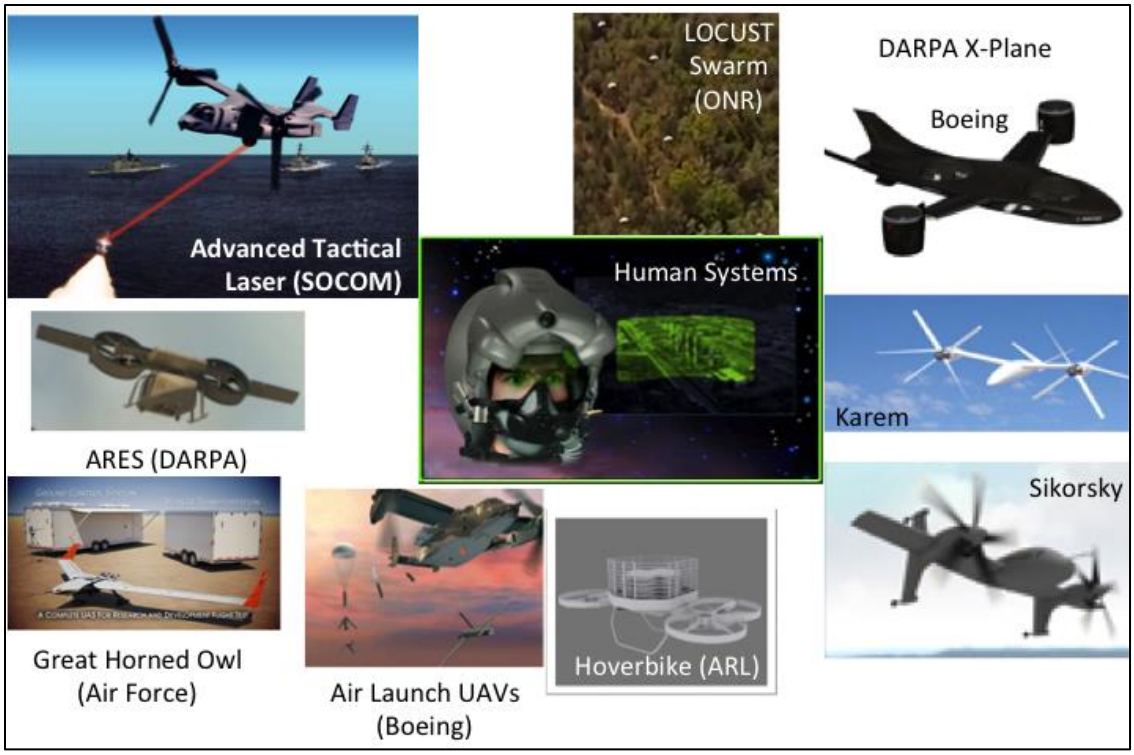

Figure 4-22. Aviation Innovation Examples

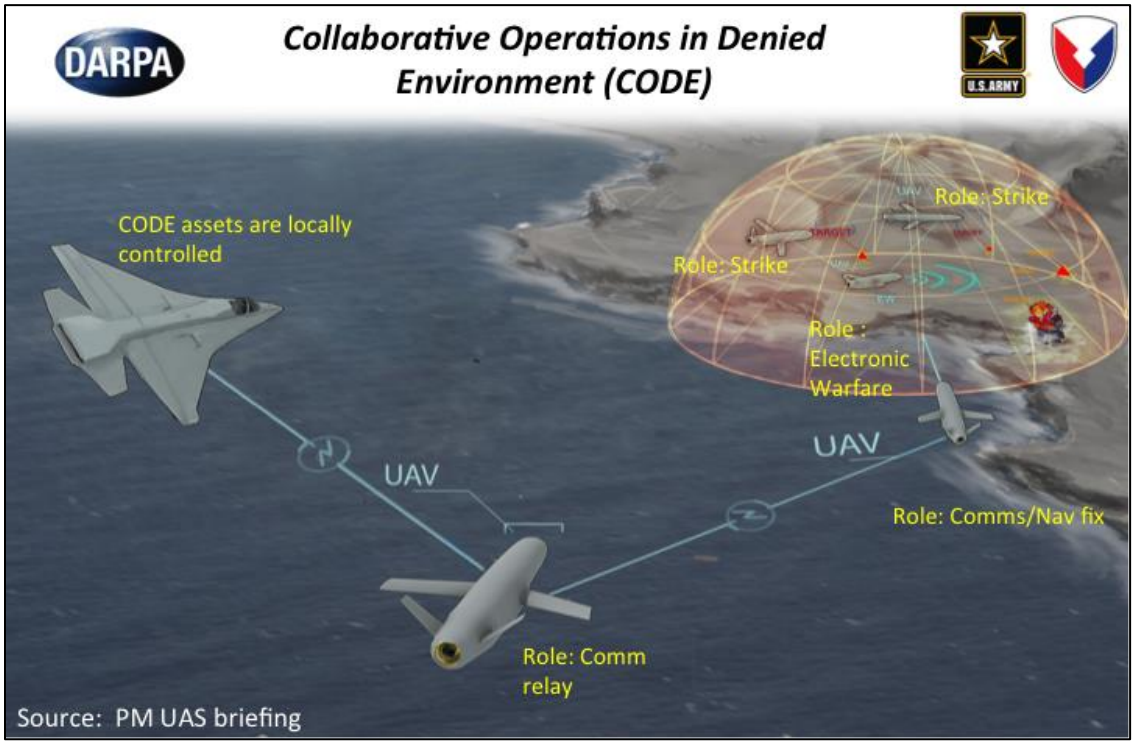

Figure 4-23. DARPA-RDECOM CODE Program

The ASB study team recommends that RDECOM develop advanced technologies for an integrated/ holistic manned/unmanned architecture/system to help ensure survivability and

976 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

mission success. The team also recommends that ASA(ALT) include in its S&T portfolio appropriate leap-ahead technologies. The findings and recommendations on this topic are summarized in Figure 4-24.

Findings

- Army Aviation is at a crossroad of challenge and opportunity.
  - The challenge: threat sophistication will demand a transformation in the nature of warfare in 2025 and beyond (missiles, UAS, DE, Cyber).
  - The opportunity: technology is emerging that enables significant improvement in aviation capabilities.
- Advanced technology solutions are required, including: UAS, autonomy, manned-unmanned collaboration, communications, directed energy, sensors, condition-based and near-zero maintenance technology/concepts, and other discoveries from the S&T enterprise.
- There is relevant work in other Services, DARPA, and NASA that should be leveraged.

Recommendations

- RDECOM: To address expanding complex threats and opportunities develop advanced technologies for an integrated/holistic, manned/unmanned architecture/system to ensure survivability and mission success.
- ASA(ALT): Include in S&T portfolio leap-ahead technologies (counter-DE, counter-UAS, advanced materials)

Figure 4-24. Findings and Recommendations Set #8

4.9 S&T Investment Strategy

One of the most successful Army Aviation development efforts has focused on improved turboshaft engines. The ITEP and FATE programs have led to improved engines that can be transitioned from S&T to programs of record for legacy systems, but they can also be incorporated in designs for future vertical lift. Maintaining active participation in engine development programs is key to achieving further advances and program transitions.

Most of the current Army investment in aviation technologies is focused on manned rotary wing platforms. If the manned-unmanned formations described above are to be evaluated and potentially implemented, S&T funding must be made available to develop the needed unmanned platforms and control systems.

As is documented in Appendix I, the Army Total Funding request in the FY2016 Budget Request is $147B ($126B Base and $21B OCO). Within the base budget, $16.1B is allocated for Procurement, with $5.7B for aircraft (34% of the total). In contrast, the total Army S&T budget request for Applied Research (Budget Area 2) and Advanced Technology Development (Budget Area 3) is $1.77B, with only $144M (8%) committed to Aviation projects. Thus only 8% of the BA2/BA3 budget request is expected to support 34% of the procurement request. This is not sufficient to meet the challenges discussed above.

977 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

According to data from the OSD Air Platforms Community of Interest (COI), the Army FY2016 request amounts to 64% of the DoD BA2/BA3 request for rotary wing aircraft. This is consistent with the Army's role as Lead Service for rotorcraft. The next largest contribution is from DARPA, largely for the VTOL X-Plane effort. NASA funding for rotorcraft is minimal ($20M). Thus the Army cannot rely on any other Government organization for significant rotorcraft development.

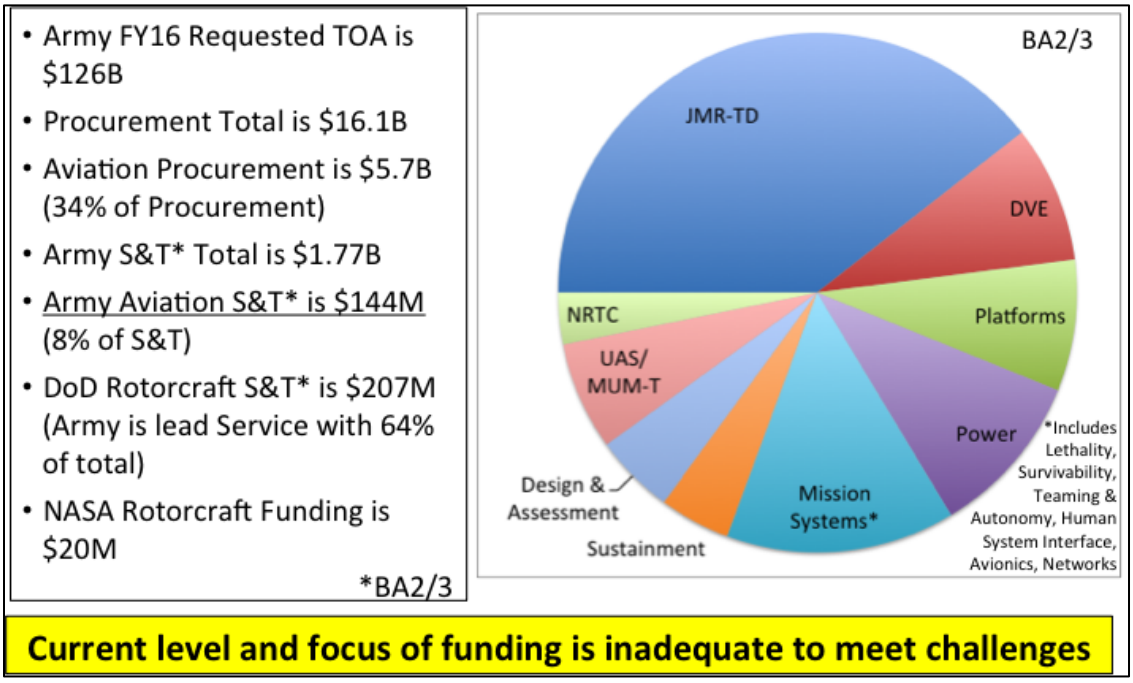

Figure 4-25. Meeting Future Challenges Demands a Robust Aviation Portfolio

One potential means to increase funding for aviation S&T is to employ innovative mechanisms for external collaboration with universities and industry. An example of such a mechanism is the DARPA Grand Challenge mechanism used to encourage development of autonomous ground vehicles. It is recommended that ASA(ALT) advocate for additional funding for Aviation S&T. Figure 4-26 provides a summary of findings and recommendations for this topic.

978 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

Findings

- Based on findings in Sections 1-8, the capabilities of Army Aviation S&T must evolve rapidly (e.g., need to expand UAS and autonomy activity); thus the level of S&T activity must expand beyond the manned aviation S&T portfolio, which is currently well managed.
- Army S&T investment has led to successful ITEP and FATE engine developments; the transition of these S&T efforts to PORs is essential to both FVL and modernized legacy platforms.
- Current S&T investment is insufficient to achieve the needed transformation and to maintain overmatch in 2025 and beyond.

Recommendations

- AMRDEC/ADD: Continue active participation in VAATE and RAMPED engine development.
- RDECOM: Explore innovative mechanisms for external collaboration (university, industry, etc.), such as grand challenges (similar to DARPA construct).
- ASA(ALT): After exploring leveraging opportunities with other R&D activities, advocate more funding for Aviation S&T.

5 CONCLUSION – THE FUTURE OF ARMY AVIATION

This Army Science Board study examined options for the Future of Army Aviation in the 2025-2040 time period that were informed by (1) clear trends in the rapid global growth of technology; (2) numerous serious, increasing, and evolving threats; (3) more than 30 visits to various Government and non-governments facilities and forums; and (4) a review of some 500 documents. Based on this work, the study team concluded that a context was critical to identifying these technical and operational options.

The rate of change of technology in the 21st century presents both challenges and opprtunities. The study team looked at an approach to this rapidly evolving and uncertain environment that requires the development of a new architecture able to adapt quickly, is cost-constrained, takes advantage of advancing technology, applies integrated systems thinking, and ultimately provides needed warfighting capability. This "System of Systems" construct (a way to describe different approaches that employ capabilities from the ground and air) provides for future capabilities, not only for airborne assests, but also for ground and air warfare. In this context, the study team's first and most important recommendation is that "Systems of Systems Operational Effectiveness Analyses" must be conducted to help identify the needs for Army Aviation. These analyses will inform many of the remaining recommendations.

The study team has strongly recommended increased emphasis on unmanned aircraft systems (UAS) with appropriate use of autonomy in conjunction with, and complementary to, human capabilities. The ISR focus of current UAS, with some limited attack capability, can and should be rapidly expanded. It is the human-machine system optimization that provides flexibility and affordable new capability in tomorrow's fight. Consistent with an evolving character of warfare and potential new roles for Army Aviation, our people in this Human-Machine System will need new systems operations/management skills and capabilities to deploy Army Aviation in the future Joint fight. For example, helicopter pilots would have a greater role in directing a "formation" of air assets, only some of which have soldiers in them.

Intellectual capital and innovation would be hallmarks of this adaptive system. Modularity of "system" design and deployment would allow increased speed of adaption and affordability. The potential exists to provide needed capability in a rapidly changing environment through the use of more, relatively inexpensive "parts" that are quickly integrated into increasingly dynamic and tailorable complex systems. Thus, Army Aviation capability is derived more from the "system of systems" rather than from the individual "parts" or platforms. The attributes of the "system" outlined in this report include implementing a "cost-imposing strategy" on the adversary, plus affordable speed of adaption to new and uncertain environments and to new technical and operational oportunities.

As presented in the study team's concluding briefing chart below, the threats are rapidly changing, the character of warfare is changing, and Army Aviation must change too. Thus, to win in a complex aviation world, the study team believes that an Aviation Systems of Systems approach is necessary. This approach must be pursued with urgency.

APPENDIX A TERMS OF REFERENCE

SECRETARY OF THE ARMY
WASHINGTON
JAN 0 6 2015

Dr. James Tegnelia
Chairman, Army Science Board
101 Army Pentagon
Washington, DC 20310

Dear Dr. Tegnelia:

I request that the Army Science Board (ASB) conduct a study entitled "Army Science and Technology for Army Aviation 2025-2040."

Analysis of the future Army operating environment suggests that under the current investment strategy, the Army will retain technology advantages to the end of this decade. After 2020 the Army will begin to experience erosion of overmatch, and between 2030 and 2040 the Army can expect to lose the edge in several key areas. To meet these challenges, aviation must address today's needs while balancing investments in innovation to enable next-generation aviation capabilities.

The objective of the study is to identify and assess Science and Technology (S&T) enhancements capable of being fielded during the 2025-2040 timeframe that will increase Army Aviation's expeditionary capabilities to support full-spectrum military operations and reduce its sustainment tails and logistics footprint. The study should:

a. Review current Army, Navy/USMC, Air Force, DARPA, OSD, NASA and industry aviation S&T plans, modernization plans and ongoing developments, as well as relevant Force 2025 and Beyond Campaign activities.

b. Address the use of innovative technologies that increase capabilities, overall mission effectiveness, survivability and lethality while reducing sustainment requirements, including logistics footprint and frequency of resupply.

c. Include, but not necessarily be limited to, the following key focus areas for improvement: (1) near-zero maintenance platforms and systems, (2) exploitation of unmanned aircraft systems, (3) meeting the challenges of emerging threats and (4) enhancing the ability to operate worldwide in a variety of stressing and degraded visual conditions.

d. Determine the feasibility and risks associated with each of the findings and recommendations.

The G-3/5/7 is the sponsor of this study and will assist the study team in accessing classified information up to Top Secret and including Sensitive Compartmented Information and Special Access Programs. The ASB shall present a comprehensive

983 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

briefing that describes the study methodology and includes all findings and recommendations to the G-3/5/7 and me by September 30, 2015. The final written report shall be provided by October 31, 2015. All data supporting study findings and recommendations shall be available to Army senior leaders upon request.

The study will be conducted in accordance with the Federal Advisory Committee Act and DoD Directive 5104.4, "DoD Federal Advisory Committee Management Program." It is not anticipated that this study will need to go into any "particular matters" within the meaning of Title 18, United States Code Section 208, nor will it cause any member to be placed in the position of acting as a procurement official.

Sincerely,

John M. McHugh

APPENDIX B STUDY TEAM MEMBERS

The 2015 ASB Army Science and Technology for Army Aviation 2025-2040 study consisted of the following members and support staff:

Dr. Ron Sega (Maj. Gen. - Ret) (Chair)

Dr. Mark Glauser (Vice Chair)

Dr. Nancy Chesser

Mike Heinz

Grant Hollett (RADM - Ret)

Tom Ramos

Teresa Smith

Dr. Bill Snowden

Dr. Alan Willner

Red Team Advisor: George Singley

Study Manager: Maj Andy Brown

- ASB Team members attended the Quad-A Summit

Aviation Development Directorate / 1-2 April 2015 / Huntsville, AL

Specific Lines of Inquiry:

1. What do you consider to be ADD's core competencies?
2. Why was ADD's Advanced Systems and Concepts Office eliminated?
3. What is expected to be the next breakthrough in rotorcraft and why is it a game changer?
4. The 2007 DSB report on VSTOL aircraft supported by the SecDef cited a number of deficiencies in DoD rotorcraft programs, including in the areas of survivability, vulnerability, flight and crash safety, crew cognitive overload, and reliability. What actions has ADD taken and what progress has been made in response to the report? What remains to be done, and are the requisite resources and technological opportunities available?
5. How do ADD activities leverage technological developments of the Special Operations Aviation (SOA) community?
6. Does Army Aviation have a propulsion RDA roadmap? How important is ITEP? To what extent are ITEP and the JMR Tech Demo scalable for FVL?
7. How do ADD personnel and programs interface with ARL, PM ASE, PEO Aviation, PEO IEWS, PM UAS, NASA, and DARPA?

986 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

8. What advanced/innovative concepts and technologies under development within ADD can be expected to contribute to the CSA's Force 2025 and Beyond Campaign being led by CG TRADOC?
9. What are ADD's principal contributions to the JMR Tech Demo and FVL programs?
10. What are the upper and lower limits of the scalability of JMR Tech Demo to smaller and larger rotorcraft?
11. Have design concept synthesis and assessment studies been conducted to evaluate alternative design options (e.g., tilt-rotor, compound or hybrid concepts) against the capability needs and performance goals of each class of the FVL FoS, as documented in the FVL FoS ICD (April 2013) and the JFTL ICD (October 2009)? What conclusions can be reached regarding the best fit of each concept to each class?
12. Has the robustness of each design concept to requirements creep or changes been studied? Robustness in this context means low sensitivity of the design gross weight and performance to requirements changes (e.g., payload weight/size, mission equipment SWAP, threat capability or countermeasures, etc.) during full scale development. What conclusions can be reached?
13. Has the life cycle cost for each FVL class (including Ultra) been evaluated? Please provide best LCC estimates at this time. What is the estimated cost savings for each class if designed from the outset as an unmanned system instead of a manned or optionally manned system?
14. Which performance objectives from the FVL FoS ICD and the JFTL ICD are the most challenging for each class of FVL? Which objectives, if tailored, would result in the greatest benefit from vehicle size, overall capability and cost standpoints? Which are the most challenging from a technology development standpoint for each class?
15. How applicable are the technologies to be embedded in the JMR Tech Demo to the other classes of FVL (other than Medium)? Which JMR technologies are also good candidates for transition to rotorcraft Programs of Record? What percentages of AMRDEC BA2 and BA3 R&D efforts are devoted to JMR?

PEO Aviation / 1-2 April 2015 / Huntsville, AL

Specific Lines of Inquiry:

1. The 2007 DSB report on VSTOL aircraft supported by the SecDef cited a number of deficiencies in DoD rotorcraft programs, including in the areas of survivability, vulnerability, flight and crash safety, crew cognitive overload, and reliability. What actions have been taken and what progress has been made in response to the report? What remains to be done, and are the requisite resources and technological opportunities available?
2. What specific technologies were inserted in the latest block upgrades to the AH-64, UH-60 and CH-47? What improved system and operational capabilities were fielded as a result of these block upgrades? What was the total investment associated with each of these upgrades?
3. Are any additional upgrades planned for these rotorcraft? If so, what technologies and capabilities advances are part of these plans? What funding is in the POM to initiate these upgrades?

987 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

4. What is your assessment of the ability of the latest or planned upgrades of AH-64, UH-60 and CH-47 aircraft to effectively perform their missions against evolving threats over the next 20-30 years?
5. What additional unplanned and/or unbudgeted technology insertions and/or block upgrade improvements would have the greatest positive impact on mission effectiveness over the next 20-30 years?
6. Are there any technologies in development for the JMR Tech Demo program that would be good candidates for insertion into the AH-64, UH-60 or CH-47?
7. What is your assessment of the current Army Aviation portfolio and the VCSA portfolio review process? What were your top priorities not fully funded in the current Army Aviation portfolio?
8. Does the Army have an operational architecture, systems architecture, and technical architecture for its current and future fleet of unmanned aerial systems?
9. In the last 10 years, what technologies or advanced products developed/sponsored by DARPA have been incorporated in Army Aviation? What is your assessment of the current DARPA VTOL program?

APPENDIX D JOINT MULTI-ROLE TECH DEMO AND FUTURE VERTICAL LIFT INITIATIVE

Future Vertical Lift (FVL) Family of Systems (FoS) is an initiative (not yet a program) to develop a family of rotorcraft for the United States Armed Forces. Originally four different sizes of aircraft were to be developed. They are to share common hardware such as sensors, avionics, engines, and countermeasures. The precursor for FVL is the Joint Multi-Role (JMR) Technology Demonstration (TD) program, which plans to demonstrate relevant technologies in 2017.

D.1 Joint Multi-Role Technology Demonstration (JMR-TD)

The Joint Multi-Role Technology Demonstration (JMR-TD) is a 50/50 cost sharing initiative between the Army and vendors. JMR-TD is **NOT** a prototype for Future Vertical Lift – it is a technology demonstration. Four vendors were selected in October 2013 to begin designing a vehicle demonstrator:

1. AVX Aircraft Company – coaxial-rotor, ducted-fan compound helicopter
2. Bell Helicopter, a Textron Company – tilt rotor
3. Karem Aircraft Inc. - variable-speed tilt rotor
4. Sikorsky Aircraft – Boeing Company – coaxial rigid-rotor, pusher-propulsor design

Figure D-1 Phase 1 JMR-TD Designs

In August 2014 the competitors were down-selected to two, Bell and Sikorsky-Boeing, to build demonstrators for 2017 flight. Details of those designs are shown in Figure D-2 and Figure D-3. The remaining two competitors, AVX and Karem, have been funded for technology development.

990 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

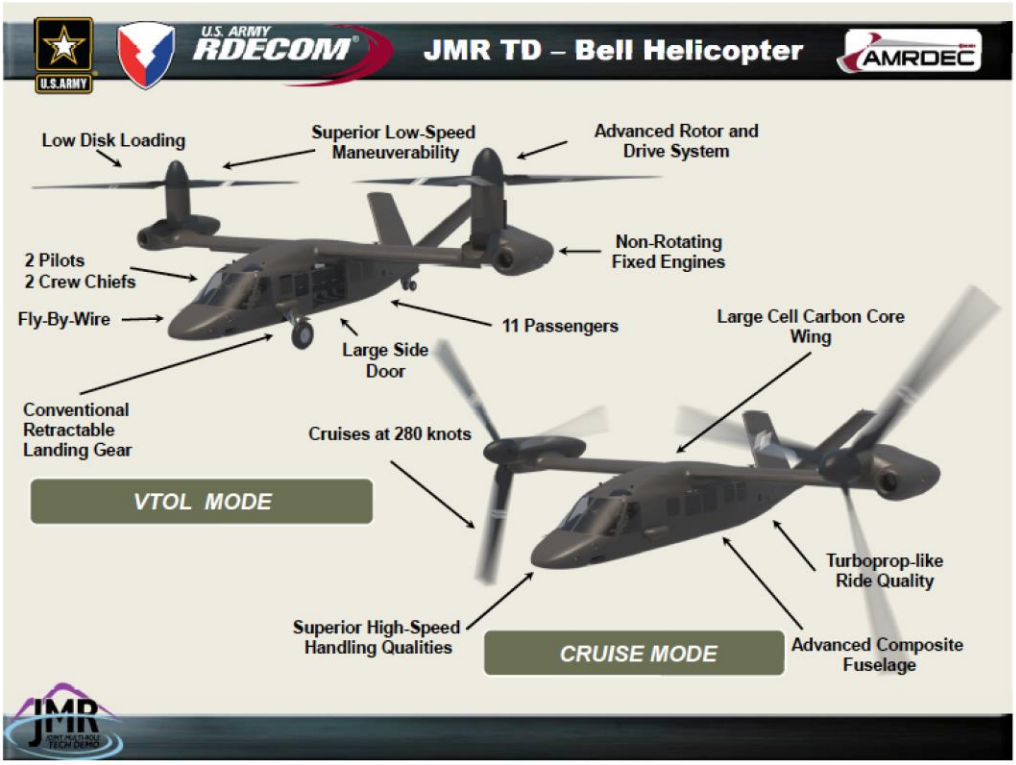

Figure D-2 Bell Helicopter JMR-TD Design

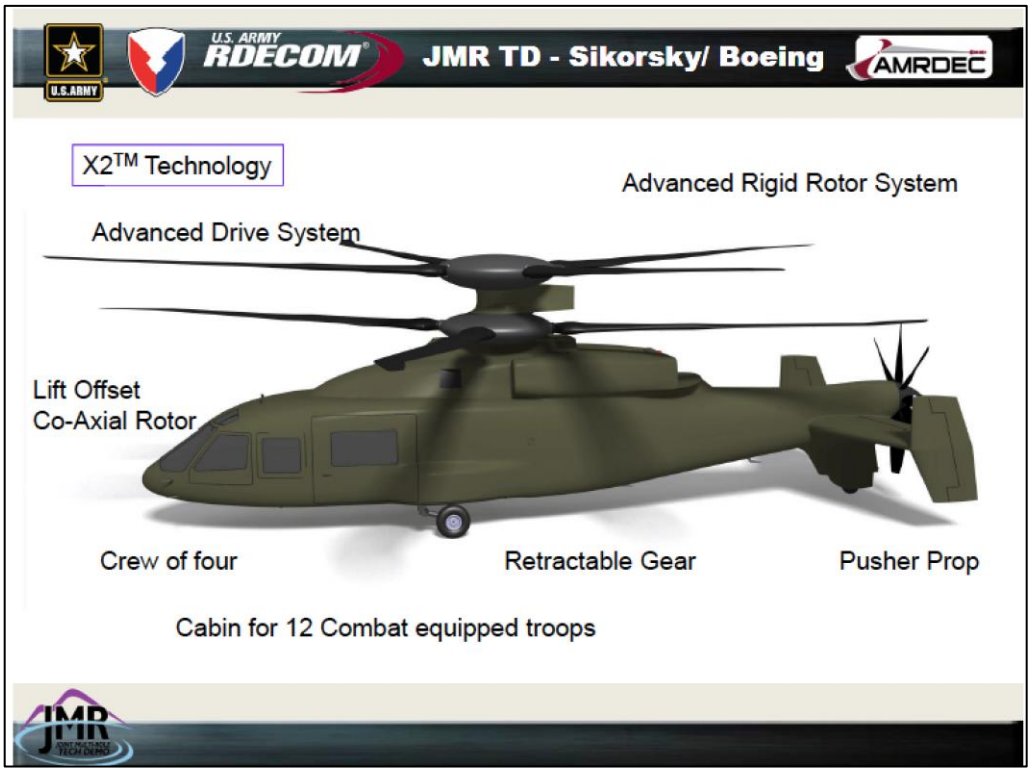

Figure D-3 Sikorsky/Boeing JMR-TD Design

991 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

Both vehicles use existing engines (the CH-53 engine for Bell and the CH-47 engine for Sikorsky-Boeing).

The schedule for the JMR-TD is shown in Figure D-4. The Air Vehicle Demonstration (AVD) at the top of the figure will enable learning with regards to

- Advanced technology implementation on high speed air vehicle configurations
- The refinement of analytical methods for coaxial and tilt rotor configurations
- The collaboration of the rotary wing enterprise to provide an advanced, efficient, affordable aviation weapon system

Because it is too early to design a mission equipment package (MEP) or mission systems architecture for FVL, the Mission Systems Architecture Demo (MSAD) shown at the bottom of the figure will focus on standards, processes and tools to support the FVL.

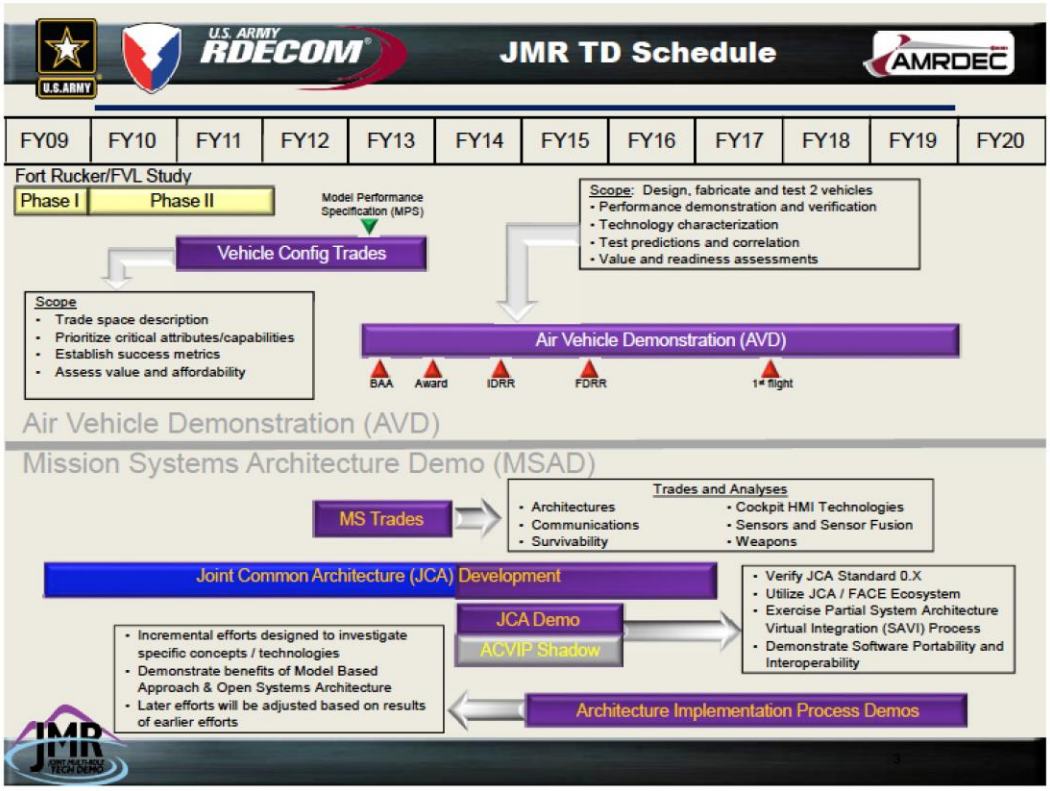

Figure D-4 JMR-TD Schedule

D.2 Future Vertical Lift (FVL) Family of Systems (FoS)

Because the current FVL initiative will presumably lead to a development effort, and perhaps a procurement effort, much of the information obtained by the study team is competition sensitive and will not be included here.

992 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

The FVL FoS initiative is a multi-service effort led by the Army. To ensure coordination between the JMR-TD and FVL efforts, Dan Bailey at AMRDEC is the Program Director for both. The figure below shows the multiple Integrated Product Teams (IPTs) involved in scoping the FVL effort.

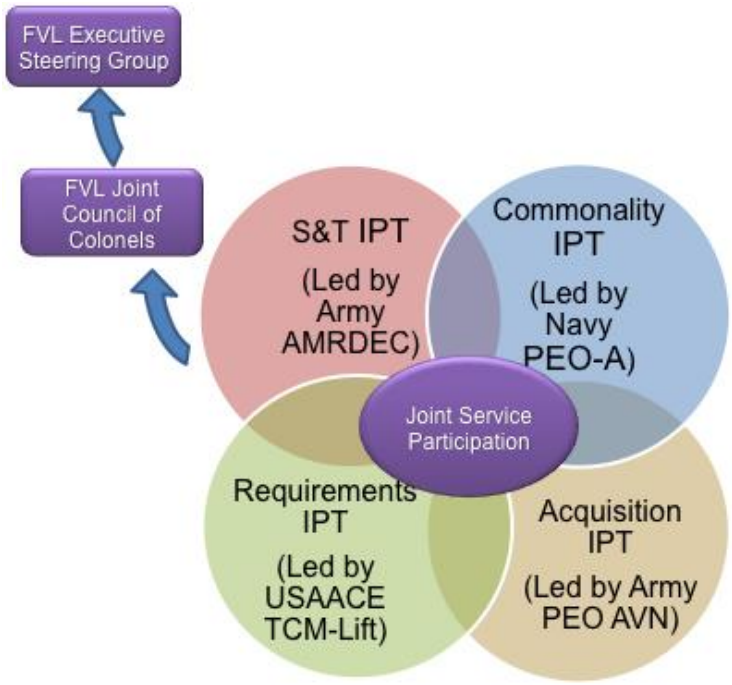

Figure D-5 Multiple IPTs Support the FVL Initiative

The duties of the individual IPTs are:

- Requirements IPT (RIPT) – will develop official requirements documents
- Acquisition IPT (AIPT) – will develop documents to support the acquisition process
- Commonality IPT (CIPT) – addresses use of common systems across FVL
- S&T Overarching IPT (SOIPT) – will develop S&T strategy for FVL (has 12 Working IPTs)
    - Air Vehicle Platform
    - Propulsion
    - Communications & Navigation
    - Weapons & Fire Control
    - Survivability & Vulnerability
    - Sensors: Pilotage & Targeting
    - Human System Integration
    - Mission Management
    - Vehicle Management / Flight Controls
    - Reliability & Maintenance
    - Subsystems
    - Training

The objective of the S&T OIPT is not to design an airplane but rather to identify technologies that might be available. FVL is NOT an airplane program – it is an initiative to develop an aviation weapon system (thus weapons WIPT etc. above).

993 DISTRIBUTION A: NOT FOR MISUSE IN SUPPORT OF IDIOTIC THEORIES| | VIOLATORS GO STRAIGHT TO GITMO FOR BALL ZAPPING

Although requirements are still being refined, the notional concept for a new aircraft must:

- Reach speeds of 230 knots (260 mph; 430 km/h)
- Carry up to 12 troops
- Operate in "high-hot" conditions at altitudes of 6,000 ft (1,800 m) and temperatures of 95-degrees Fahrenheit,
- Have a combat radius of 424 km (263 mi) with an overall unrefueled range of 848 km (527 mi).

As is shown in Figure D-6, technology assessment for FVL takes place in the JMR Technology Demonstration. Capabilities Assessment at the top of the figure shows the major documentation that must be developed for an acquisition program. Note the anticipated Materiel Development Decision is October 2016 and Milestone A is January 2019.

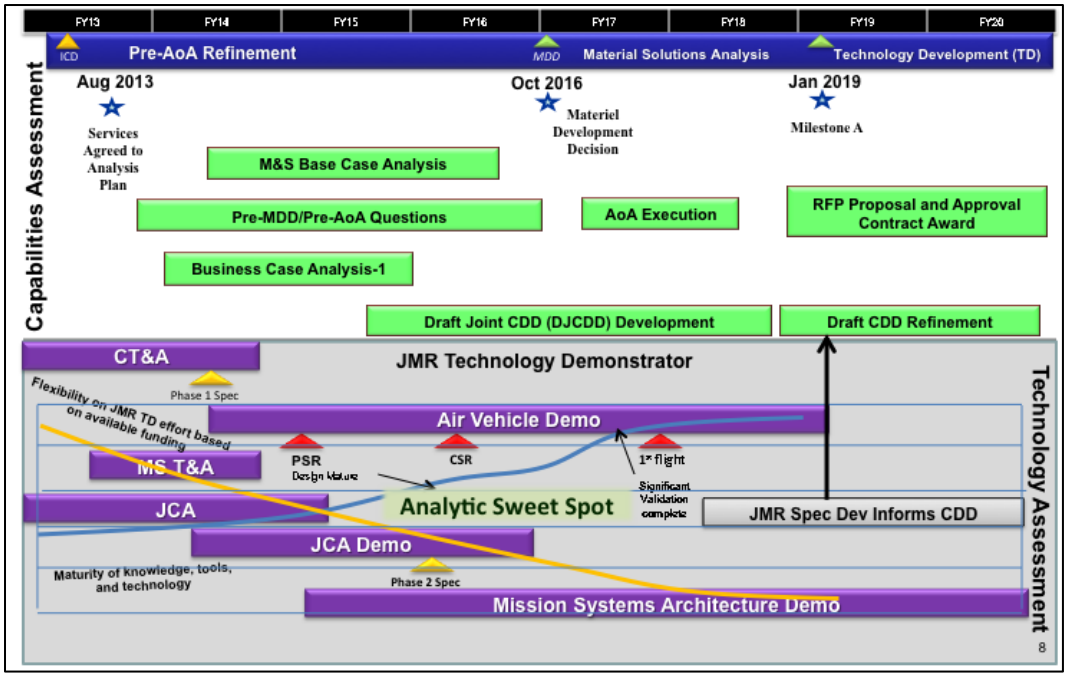

Figure D-6 Projected Road Ahead for FVL
